This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

CHAMBERS'
DINBURGH JOURNAL

ICTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

NEW SERIES. SATURDAY, JANUARY 3, 1846. PRICE 1½d.

INNOCENT RAILWAY.

railways in general are the scene of so many idents, it is pleasant to know there is one breaks bones—namely, the Edinburgh and ilway. A friend of ours calls it *The Innocent* being so peculiar for its indestructive cha- also with some reference to the simplicity of management. It is really quite refreshing, upon any of the whizzing, whistling, snort-, and blowing railways, and having one's exasperated by their frantic speed, to get a sion by the Innocent Railway, where you ith or Musselburgh, five or six miles off, in ss than an hour, dragged all the way by an k-horse. An easy, unpretending business ocent Railway carry on—passenger carriages ours, and only a few coal wagons besides, ng half asleep continually. No racking ere at the St Leonard's station; no hurry- ie Fisherrow terminus. You pass through amping office—you pay not at all till seated age, or perhaps half gone in your journey. hat railway business would have been in the ipe long ago, if railways had then and there

is, that the Innocent Railway dates from the e of its class, having been set agoing some s ago, when as yet men thought ten miles an rapid rate of personal transit, and had not e ancient idea, that there was some virtue in a means of locomotion. The primeval ar- with which it started, it has ever since t is a leisurely, respectable old railway, that lently think it a mark of decline in the rofess a great anxiety for business. It right tone at first, and there it remains. ccordingly, a vast deal of food for amusing about the Innocent Railway. I feel a ng its lines to be much like reading a Bracebridge Hall.

ing at the St Leonard's depôt—about the Scott locates the Deans family—you are at ed into a great wooden carriage, where haps two or three young families, under the ir respective mammas, have taken up their But probably you prefer an outside seat— e outsides on the Innocent Railway—and so ounted up in front beside the driver, or else ular seat behind. Your companion is per- n-servant, or a sailor, or one of those nume- ribable blue-and-drab men who live about nd have a great deal to say about markets. arriage full of fishwomen from Fisherrow judiciously in the rear; and there they sit, smoking their pipes or counting their money in their tenfold laps—the labours of the day all past—nothing now to be done but to cruise home by the Innocent Railway, 'in maiden meditation fancy-free.' Singly and in groups come up the passengers, country-people most of them, with a great tendency to cotton umbrellas and bundles, but also a sprinkling of more lady and gentleman-like personages. There being only one set of carriages, with one set of charges, the conductor makes an eye selection of passengers for a certain set of seats, and contrives to gratify most, without offending any. Perhaps, however, an ancient dame with a black cotton shawl, and all hung round with baskets and parcels—her purchases in town—comes up rather late, and clamours for a seat beside some friends who have preceded her.

'Ye canna get in there. Dinna ye see it's filled?'

'Ou ay; but they'll mak room for me.'

'I tell ye ye maun come in here. Od, ye'll be owre late. There's the bell ringing.'

The carriage accordingly begins to move—the old lady gets into a state of excitement; and crying, 'Aich, sic an unceevil man!' projects herself, with all her appendages, into the compartment indicated, where you hear her grumbling for the next quarter of an hour. But even after a movement has commenced, you can hardly be said to have taken leave of the station. There is always a woman with some children seen running after the carriages, flagrant and sudorific, in a needless fright at the idea of being left behind, and who has to be taken in, juveniles and all, during the pause which is made before descending the tunnel. This reminds me, by the by, to say, that nobody is ever too late for the Innocent Railway. One day we had started from Fisherrow up the inclined plane, when a washerwoman, with a huge burden of clothes upon her back, was seen making after us along the line, occasionally waving a hand, in the hope of its prevailing upon the conductor to stop. We thought the poor woman had no sort of chance of making out her passage; but, wonderful to say, she overtook us, burden and all, at a place where a short pause is made, a mile and a half forward. The Innocent Railway has a great consideration for such of the dilatory as heroically persevere.

The first pause, while the rope is fixing for the tunnel descent, suffices to take in the perspiring female and family. There is a second stoppage—quite leisurely—at the bottom, to detach the rope and yoke the horses to their respective carriages. Off they then go, trotting at a brisk pace past Duddingston Loch; but we have not advanced above a quarter of a mile, when a lady with a parasol and ten bandboxes is seen waiting for us at a cross-road; and there is of course a pause to get her taken in. This accomplished, on we go again; but lo, ere we have gone another mile, we have to stop at

another cross-road to let off a farmer. Once more in motion, we advance rather briskly—that is, at the rate of about eight miles an hour—in order to make up for lost time; but this has not lasted half a mile, when we meet the carriages proceeding to town, and have to stop, in order that the drivers may pass some message in the one or the other direction. Such are the incidents which mark a passage by the Innocent Railway. 'Hasten slowly' is its motto.

The prime event, however, of a journey by this railway, is the stop made at a cabin near Brunstain, where the passengers are reckoned, and interchanges take place for different towns, to which there are branch lines. Here half a dozen vehicles will be seen clustered together on the different rails, waiting while a man with book and pen goes through them all, to take the sum of the persons bound in different directions. As there is thus an interval of about five minutes, the conductors are always able to have a little gossip with each other about the topics of the day, and if you have open ears, you will be very apt to hear how Jock's 'meare' hanked yesterday in her bridle, or Tam was fined for being ten minutes too late in getting to the bottom of the tunnel. Very probably, at first stopping, you heard one voice saying—

'How mony hae ye the day, Willie?'

'Thirty-nine and a half.'

'How mony came off?'

'Six—twa Leith, and four Da'keith.'

A pause ensues, during which you may amuse yourself by studying the productive powers of a neighbouring turnip field, or observing the bustle about the door of the passengers' room. But hark! there is a stamping and kicking, as of horses. Jock's meare has once more become disaffected. 'Haud her head! Haud her steeve! Man, ye're no worth a fardin. Gi'e me the whup. I'll learn her to gang on that gate.' Then a stamping worse than ever, mingled with the cracks of the whip, the execrations of men, and the clamours of women from the coach windows. At length peace is restored, and you hear a former dialogue continued—

'There's forty, Willie. How could ye say there's only thirty-nine and a half?'

'Ye're blind, man. D'ye no see the callant sitting ahint?'

'That a callant! He's as muckle a man as ever he'll be.'

'Nae matter. I only got twopence frae him. Canna ye mak haste, man?'

'Weel, weel—ca' him a half. Thirty-nine and a half. A' richt noo.'

'Gi'e me the book, then.'

At length the business of reckoning and interchanging being over, the carriages are all allowed to go off to their various destinations, leaving the cabin to two hours more of rural quiet. The Musselburgh carriage, upon which we are supposed to be bestowed, is drawn forward about a quarter of a mile, and there another stoppage takes place. We have now reached the top of an inclined plane, of a mile and a half long, down which the carriage is to proceed by its own weight, and at the bottom of which the Musselburgh, or rather Fisherrow, station is situated. There is therefore no longer any need for the horse, and it is accordingly unhooked, and led away by a boy. During the pause, and the first slow movement of the detached carriage, you observe one or two carbonaceous youth from the village of Wanton Wa's quietly attaching themselves to the rear, as an unlicensed addition to the passengers—nobody has any fear of accidents on the Innocent Railway. The driver is now a man at ease, and for the first time does he take a snuff. A rustic friend, to whom he imparts the box, asks—

'Carrying mony eenoo, Willie?'

'Ay, a gude wheen.'

'Ye wad hae a few additional on the Edinburgh fast-day last week?'

'An awfu' day Thursday. Five thoosand!'

'The yeomanry races, too, will do something for ye.'

'Yes, the races is aye three thoosand gude. We'll gang every quarter of an hour a' day.'

'Ay, and the Da'keith fair 'll be sune on. Everything helps.'

'Ou ay. What are they saying o' the potatoes down bye wi' you?'

'Ou, they're saying they're no sae bad.'

But agricultural speculation is quickly broken off by the necessity of stopping the carriage at the Stonyhill crossing, in order to let off Sir Charles's servant with a basket. This being accomplished, a few more minutes bring us into the station at Fisherrow. The passengers land in a place like a farm-yard, where ducks and hens, and a lounging dog, and a cottager's children, are quietly going about their usual avocations, as if undreaming that they are within fifty miles of such a thing as machinery. And so ends the journey of exactly four miles and three quarters by the Innocent Railway. On consulting your watch, you find it has required exactly forty minutes.

And now, my co-mates, I would ask if a railway of this simple and primitive character be not something infinitely better than your whisking locomotive lines, where you never have leisure to look a moment about you? There cannot, in my opinion, be the shadow of a comparison between the two. By the Innocent Railway, you never feel in the least jeopardy; your journey is one of incident and adventure; you can examine the crops as you go along; you have time to hear the news from your companions; and the by-play of the officials is a source of never-failing amusement. In the very contemplation of the innocence of the railway, you find your heart rejoiced. Only think of a railway having a board at all the stations forbidding the drivers to stop by the way to feed their horses, under a penalty of half-a-crown—the 'way' being altogether only a few miles! Just conceive a railway where the carriages have barefooted boys to come off and run on in advance to change the switches! Or imagine any other railway on earth where such a circumstance as the following could take place. During the pause of a Musselburgh *up*-train at the bottom of the tunnel, a quiet-looking man, seated on the back of a carriage, said to a friend whom he recognised on the front of the next behind, 'Is the charge for this railway raised lately?' 'No.' 'Why, I've paid sixpence.' 'You should only have paid fourpence.' The inquiring party asked for an explanation of the driver, who came up at the moment. An answer was given in a voice that made the quiet man shrink up into half the space—

'Didna I tell ye at Fisherrow that I couldna gie ye change till we got up to the town-n-n!'

Or the following incident. A lady proceeding to town, with (as she thought) a basket containing a headdress for a dinner-party, was alarmed at the Edinburgh station to discover that no basket was anywhere visible. Had it dropped off? Where in the world was it? She made public offer of a shilling for the recovery of the

missing article, when one of the Stentors of the railway was presently heard exclaiming—

'Rin awa doon the tunnel, Jock, and look for the leddy's basket!'

Jock, however, was not successful, for the head-dress was quietly reposing amongst the hens and bairns at the Fisherrow terminus, whence it was duly hauled forward by the next train.

There is only one possible objection to the Innocent Railway—the antiquated ratio of speed; but if you have time to wait, this will be felt as no disadvantage, in connexion with so many recommending circumstances. Reader, if you ever wish to dispel the blues, or put to route the megrims, and are at what Oliver Cromwell calls some reasonable good leisure, take a forenoon trip by the Innocent Railway!

THE MIDSUMMER MANUSCRIPT.

BY FRANCES BROWN.

THE blessings of our youth be on you, bright days of midsummer, prime of the seasons, noontide of the year! The green of our woods deepens beneath your mantle, and our hills rejoice to the heart of their utmost solitude. There was joy at your coming among the nations of old, for your power and glory mingled with the faith of the elder time. The Celt kindled the beltane fire on his mountains for your welcome, and the men of the far east spread 'the feast of roses' by the lovely lakes of Cashmere. The world has outlived the memories of her morning; creeds have been forgotten; gods have come and gone; but the toiling stirring multitude of earth still rejoice as ye gladden the span of their passing existence with the breath of your returning roses and the bloom of your eternal youth. So thought, or should have thought, the Monsieur de St Leon as he sat one long bright evening of that rosy time, surrounded by the chosen companions of his learned labours, engaged in winding up the work of the season. Monsieur de St Leon was a mighty man in Paris: the fate of authors, and the speculations of publishers, hung alike upon his pen: his word was law at the Théâtre Française, and more than law at the Opera Comique; for Monsieur de St Leon was editor of 'Le Voix de Paris,' a work whose sentences on the volumes of the period were unquestioned as the ukase in the dominions of the czar: in short, he was the Janin of his day; but he swayed the sceptre of criticism in a more despotic fashion, for the days of his reign were before the Revolution. Well-instructed, highly connected, and blessed with good abilities, Monsieur de St Leon had early devoted himself to literature, and now, in the meridian of life, he was known as one of the most discerning spirits of his age, the associate of *savants* of the first distinction, and grand master of the French reviewers. We shall not stay the current of our tale to say how much friends and fortune had to do with building up the fabric of his fame, but there sat the chief of critics amid his band, well pleased with both himself and them; for the last review for the season had been written, the last opera had received its doom, and the latest novel was dismissed with its proper share of well-talented praise and blame. No more was expected at least for some time, for the days of midsummer are not the days of books; and Monsieur de St Leon felicitated himself on the promised pleasure of a trip to the south, to meet the Summer amid her laden olives, and leave the crowds of Paris and the cares of criticism to less fortunate hands, till the light of her presence was passed.

Their work was done, but still his colleagues sat on in Monsieur's elegant bureau, for they had much to talk of. Most of them were amateur assistants of St Leon: some were young and ardent, some were old and prudent, and some had grown cold and cautious before the time; all were distinguished in the world of letters, and many in the world of fashion too; but among them there was only one female face, and that belonged to Senore, the orphan niece of Monsieur de St Leon. Her uncle imagined there was a marked resemblance between himself and Voltaire, because he was a bachelor, and intended to publish something original; so, by way of completing the picture, he had taken Senore to manage his domestic concerns, admire his own genius, and be in all respects a second Madame Denis. Little likeness had poor Senore to that immortalised dame; the girl was portionless, and but seventeen, a small bright-haired brunette, with a face whose expression of subdued intelligence told of long subservience to another's will, and time not spent for herself; but the sunshine of the heart played over it at times, for the light of the clear black eye had not yet grown dim and dreamy, as in the winter of years.

Projects for the future, *bons-mots* at the expense of their contemporaries, and literary gossip of all sorts, filled the bureau, when St Leon's valet opened the door, and announced, with rather a comical expression of countenance, that there was a stranger below who wished to see monsieur on very particular business. 'Show him up,' said St Leon, to whom the mention of business was at that moment anything but agreeable; and he added, in no very good-humoured tone, 'What can the fellow want that he comes at such an hour as this?' The words were scarcely spoken when his servant returned, ushering in a young man of dark pale face and low stature, rendered almost dwarfish by a habitual stoop. His dress was poverty-stricken, and made in the fashion of the provinces; his manner awkward and hesitating, like one not sure of his errand. In his hand he held a small soiled-looking manuscript, which with an awkward bow, and a few half-articulate words, he presented to Monsieur de St Leon. It was accompanied by a note from the manager of the Théâtre Française, stating that it contained a tragedy written by the bearer, which the manager would purchase if Monsieur de St Leon approved of it, and earnestly requesting that, whether favourable or not, his opinion should be given without delay.

St Leon had been hard at work for the last three weeks, and that evening was to him like the Jew's preparation for his Sabbath, and to be obliged to read over a new play, was a task he had not expected; but felt it just then inexpedient to refuse the manager's request, and therefore consented, with little grace, and less good temper. If there was one thing in this world which St Leon delighted to criticise more than another, it was the work of a poet, for monsieur had wooed the muse on his own account; and with a few cold and hurried questions to the stranger touching his name, profession, and birthplace, which were as coldly answered—for the youth had got time to collect himself, and said his name was Joseph Fauquet, his birthplace a village in Auvergne, and profession he had none at present—the great reviewer glanced once more at his shabby appearance, and proceeded to read the manuscript.

Monsieur went to work, determined not to be pleased; and many and marvellous were the faults he found in that unlucky tragedy. The plot was bad; the story was deficient in interest; the characters were unnatural; the poetry defective; and, in short, there was no possible error of style or composition into which it had not fallen, in the estimation of monsieur; and he descanted on the said errors with an eloquence highly satisfactory to his own spleen, and edifying to his friends, who seemed to concur in his opinion; for those who did not join in the censure, remained entirely silent. Among the latter was Senore; but there was deep interest in her young face and slight figure, bent forward with eagerness to catch the sound; and her eye would often kindle with pleasure and admiration at passages which her uncle unhesitatingly condemned. Fauquet sat also silent: at first, indeed, his gaze was rivetted on St Leon with such intense anxiety, as it was painful to witness; but as the critic went on, his countenance gradually settled to a cold and almost stony calmness, except when he caught the eye of Senore, and then his glance would brighten with a fire that seemed from the altar of Hope

The piece was called 'La Reine Blanche;' its subject was a story of the old romantic times, and there was poetry in it; for, as St Leon reached the climax, Senore started to her feet, exclaiming, 'Oh, uncle, is not that splendid!'

'Nonsense, child,' said St Leon; 'it wants originality.' But before he could utter another word, Fauquet bounded from his seat, snatched the manuscript from his hand, and casting on Senore one look of wild but unfathomable gratitude, darted down stairs, and rushed into the street.

'There's assurance for you,' said the critic, as soon as he could speak from the effects of surprise and anger; 'some runaway apprentice no doubt, or turned-off servant, who has mistaken his sphere, and presumed to write plays; but he has got a lesson which will serve him for the rest of his life.' And with this gentle conclusion Monsieur De St Leon dismissed the subject from his mind.

* * *

It was in the summer of 1786 that the scene we have just related took place; but there came after summers, which ripened the bloody vintage growing through ages of unchecked oppression for the crown and the coronets of France; and the name that swept from their bases both throne and altar, shipwrecked the fame and fortunes of Monsieur de St Leon. The storm had dispersed his friends, and some it had turned into enemies; and 'Le Voix de Paris,' the sword of his power and the stronghold of his glory, perished, unwept and unlamented, amid the clash of contending interests and the fall of the old institutions. His family were among the first on the lists of republican proscription. Most of them died in exile, and some in poverty; and he had wandered from land to land, with no means of life but his literary profession, which he practised with more or less success in every city of Europe. But years had passed over him, and St Leon had grown old, and alone; for poor Senore, who had long been the faithful companion of his wanderings, at length agreed to the proposal of an eminent German publisher, to become Madame Wessendorf. The match was a good one, but the girl had hesitated long, as if there was some old love that rose up in her memory. But at length the declarations of her uncle, 'that she had no fortune, and must be provided for,' and Wessendorf's handsome settlement, prevailed. She had been married five years, and now resided in Paris; there also St Leon arrived in the summer of 184–. He had three good and sufficient reasons for his coming: the first was, to see Senore; the second, to recover a small property lost in the Revolution; and the third, to fulfil the darling design of his life—the publication of an original volume, which he hoped would revive his former fame in the memory of the Parisians. He had collected its materials for years: many a sleepless night and troubled day it had cost him. Through the terrors of the Revolution, and the privations of his exile, he had kept it, like Cæsar's Commentaries, held above the wave, even at the risk of drowning. His dream was the same, but he found the city changed. A new generation of writers and critics had arisen, who thought and spoke not like the men of his youth; for these were the days of the Empire. The intended volume was a philosophic work, which St Leon designed to be splendidly illustrated, and published by subscription; but he had now no friends in the capital; and when he explained the plan to his German nephew, that skilful trader in taste and genius shook his head solemnly, and assured him that his only hope of success lay in an immediate application to Monsieur Marzette, whose name at the head of his subscription list would be a sufficient recommendation to all the *savants* in Paris.

'Marzette?' said St Leon, for the name had reached him in many a far city as that of a rising star in the new system of things.

'Yes,' said Wessendorf, 'Monsieur Marzette, who is known as far as the tricolour streams as the first of our living authors, and the most accomplished critic in France. He is now a member of the French Academy, and will likely soon be a peer of the empire; for the emperor, though more partial to the genius of the sword than the pen, it is said, has expressed a high opinion of him; and Madame La Mere, Cambaceres, and all the people of influence, are his friends; but he is very amiable,' continued Wessendorf, 'and receives everybody. All Paris crowd to his hotel on the reception nights; to-morrow is one of them; and as I have the honour of knowing him, and am going to introduce madame, I think I might manage to do the same for you.'

Next evening found Monsieur de St Leon, with his niece Senore and her German husband, entering a splendid hotel of the Place de Luxemburg, in which was the residence of Monsieur Marzette. All Paris seemed indeed there: the street was crowded with brilliant equipages; and crowds of fashionables poured in, till the scene reminded Senore and her uncle of the last great ball they had attended in this very house, when it was occupied by the Count de Marigny, two months before the taking of the Bastile. With some difficulty they got through the crowded house to the principal saloon, in which the great man sat. That room was no less gay and magnificent than when St Leon and his niece last stood within it; but the years that intervened had done their work on them. St Leon was an old and a worn-out man, and Senore had grown a large and handsome matron, with a brow that told of many trials, and hair which the winters of life had touched early with their snows; but Wessendorf presented them to a small dark-complexioned man of graceful bearing, and somewhat stern, but strikingly fine countenance, dressed with a taste which spared no expense—and that was Monsieur Marzette. He saluted Madame Wessendorf with cordial and habitual politeness, but St Leon thought he looked long and earnestly upon her; and when his own name was pronounced, a strange expression, like that of great pain, passed quickly over his face; but he recovered himself in a moment, and saluted him with great frankness and affability, professing to have heard of his well-merited celebrity, and even made room for him beside himself. St Leon's heart was gratified; for, seeing the principal person pay him so much attention, all the rest of the company followed his example, and the old man felt as if the far-past days of his glory were returning once more. But he did not forget to turn so good an opportunity to the advantage of his long-projected volume, and soon found means to introduce the subject, and enter into all its details. Monsieur Marzette listened most graciously; and when St Leon wound up his discourse by requesting the aid of his influence and name, he said, in an under tone, 'Most willingly, my dear monsieur; but will you have the goodness to remain till the company have retired, for I wish to speak with you in private?'

St Leon of course assented; but all that evening he puzzled himself in vain to guess what Marzette could have to say to him of such secrecy; and Marzette himself, though courteous and friendly to all, and especially to him, seemed strangely absent at times; and his looks often wandered, as if unconsciously, towards Madame Wessendorf. Never had St Leon looked so earnestly for the close of a soirée; but it came at last, to his great relief. The company began to depart; and when the greater part of his guests were gone, Marzette requested his presence in the library. It was a large and noble apartment; and the two sat there alone, opposite to each other, and silent for some minutes. At length Marzette, fixing his eyes upon St Leon's face with a sad and a searching look, said, 'Monsieur St Leon, do you remember the 20th of June 1786?'

St Leon mused a moment, but in all the dusty archives of his memory there was no record of the day, and he answered, 'Indeed, monsieur, I cannot say that I recollect anything particular of the date you have mentioned.'

'Well,' said Marzette, 'do you not remember one, with mean attire and awkward manners, who came on that day to ask your opinion of a production on which his hope, nay, almost his life depended? for oh, St Leon, he was young and poor—and I am Joseph Fauquet!'

Had a thunderbolt fallen at his feet, it could not have had a more startling effect on St Leon than this announcement produced. He sat rivetted to his chair, as the whole scene thus recalled passed rapidly before his mental vision; but awkward as his own position now was, all thoughts of the kind were lost in amazement at the transformation wrought by eighteen years.

'Do you remember it now, monsieur?' said Marzette; but his tone was still calm and sad.

'I do,' said St Leon—who was too much a man of the world not to see the ground on which he stood, when the first shock of his astonishment was over—'I do; and though I cannot believe you to be the same person, of course I do not now expect your patronage;' and he rose with all the composure he could command.

'Stay, monsieur, stay,' said Marzette, grasping his hand; 'my name, my influence, and all in my power, are at your service. I had wild thoughts of anger and revenge, which haunted me for years; but I have lived to learn better. And after all, though the lesson was hard, you did me no wrong. But stay, and tell me why you cannot believe that I am indeed the same.'

Monsieur de St Leon would have preferred almost any other place to that where he now was, but curiosity and interest both forbade his going, and he resumed his seat, saying, though scarcely conscious of what he said, 'Because it is impossible to identify a member of the French Academy with one who seemed so poor in mind as well as in purse.'

'Such is the world's wisdom,' said Marzette earnestly. 'Fop and philosopher, peasant and politician, none can see farther than the mere external trappings or accidental position. Man, there was wealth in my early poverty which I can never own again—the full fountain of youth's unfrozen affections, the strength of an unwasted and a then unwearied hope, and the faith in this world's good—which has past from me for ever. Tell me, what value do you place on these? Listen: I was one of many in a peasant's family, dwelling in a mountain village of Auvergne; my parents knew no other means of life or its comforts than that produced by the labour of their hands; their other children were strong and rosy, fitted to prosper in their narrow sphere, and they were proud of them; but I had been weak and sickly from my childhood, and they had neither love nor hope to waste on one so worthless.'

'Surely, then, they were not your parents,' said St Leon, 'for parents love their children under all misfortunes.'

'Believe it not—believe it not,' cried Marzette; 'human affections are swayed by human pride or interest, from the palace to the hut. They love the son who will be the heir of their fortunes, or the daughter whose beauty will insure a brilliant alliance; but those who have not such claims can expect only toleration, and it was so with me. The voice of one hearth finds its echo in all others. My neighbours looked upon me with the eyes of my kindred. It might have been that the iron which entered into my soul so early, had left its rust behind; but no one loved me in the place where I was born. I need not say how far my spirit wandered from the beaten path in search of the healing waters, which it found not there; nor know I whether it was loneliness of heart, or what men have called genius, that turned my steps to the boundless fields of thought; but a thirst for the old forbidden tree came early on me, and as years increased, I grew weary of my peasant lot, and left my native village with nothing to grieve for, and none to lament me. I have never seen it since. The graves of my parents are green, and my kindred have forgotten me; for my fame is linked with a name they never knew; but my dreams go back at times to the shadow of the old vine, and the light of autumn's sunset shed upon our hills. I went forth into the world alone, and scarcely knowing a step of the way; but I had many hopes, and many schemes that were bright in their vagueness, and I trusted to time and my own energies for success. You may guess the circumstances under which I came to you, when experience had partially schooled me. That was my first attempt, and it may be that it deserved your censure; but oh! monsieur, had you remembered then that the great gulf fixed between us was but the work of fortune, and given me but one word of friendly advice and encouragement, how precious should its memory have been to my after-years! I have made my own way, and learned darker lessons since then—as who has not that ever climbed ambition's precipice with their feet on the narrow ledge, and their hold on jagged rocks or thorns? But there is still a higher ledge to be gained, and they cling and struggle upwards, though sorely pierced and torn; but, monsieur,' said Marzette, and his look grew far more earnest, 'there was a girl who sat with you that evening. I know not her name, but they said she was your niece.'

'Oh, my niece Senore,' said St Leon, glad to seize any opportunity of changing the subject.

'Yes, monsieur; and what of her now?'

'Oh, she is well, and well married.'

'She's what?' almost screamed Marzette.

'She is married, monsieur,' said St Leon, involuntarily glancing towards the door, for the man's eyes were wild. 'This night her husband presented her to you. She is Madame Wessendorf.'

'Good night, good night, monsieur,' said Marzette, growing strangely and suddenly calm. 'Command my services when you please, but speak nothing of this interview, for it would serve neither you nor me.'

'What a fortune my poor Senore has missed,' said St Leon to himself, as he accompanied his niece and her German husband home.

Madame Wessendorf never visited that hotel again, and was the only person in Paris who did not speak of Monsieur Marzette. His stay in the French capital was not long; for six months after St Leon's arrival, he disposed of his effects, and emigrated to America, leaving nothing but his fame behind him. His after-progress we cannot trace; but before his departure, St Leon's property was recovered, and his volume published. It has died since, like many of its kindred. Its learned author lived and died a *savant;* but he never saw an ill-dressed stranger, particularly with papers in his hand, without looking kindly upon him—it was said in memory of the Midsummer Manuscript.

'SIX MONTHS AT GRAEFENBERG.'

This is a somewhat curious production,* purporting to be an account of a water-cure performed by the celebrated Priessnitz, and we bring it under the notice of our readers, in order that they may know something of this modern heresy in therapeutics. The author, Mr H. C. Wright, a devout believer in the water-cure, is, we presume, a citizen of the United States, where, as well as in England and Scotland, he has spent twelve years in making addresses to the public, for the promotion of Sunday Schools, Teetotalism, Anti-Slavery, and Peace; from which we may understand that he is an enthusiast in carrying out to a practical issue the theories and opinions which he adopts. Besides lecturing on the above topics, Mr Wright tells us that for fifteen years he had drunk nothing but cold water; no alcoholic liquors, fermented or distilled, no tea, no chocolate, no warm drink of any kind, had passed his lips during that time; neither had he indulged in tobacco in any form. He had further been exposed to great extremes of heat and cold, from 100 degrees above, to 10 degrees below zero (Fahrenheit), by night and by day, by land and by sea. For the sake of invigoration,

* In one volume. London: Charles Gilpin. 1845.

he accustomed himself to bathe and wash himself in cold water every morning. Notwithstanding all these precautions, his labours affected his lungs, and for three years he took great care of himself, by using flannel next the skin, fur or wool mufflers round the neck, besides otherwise averting the effects of cold. All would not do; medical advisers said his lungs were ulcerated; he had a dry and painful cough; and, in short, he was in a very bad way. Thus knocked up in health, he bethinks himself of proceeding to Graefenberg, in Silesia, there to put himself under the care of Priessnitz, the originator and head of the water-cure system.

He arrived at Graefenberg on the 9th of January 1844, along with two companions, and, as the main building was full, he got an apartment in a neighbouring house. 'We were,' says he, 'to pay three and a-half florins, or seven shillings British, per week, for the use of the room, and for firewood, until the 1st of March; at which season the increased demand for lodgings, occasioned by the greater influx of guests, generally raises the rent of the lodgings. Our room was furnished with a tile stove, which was of course a fixture; three deal bedsteads, which were simply oblong boxes on legs, without hangings above or below; a sofa covered with leather; a small mirror; a clumsy washing apparatus of coarse earthenware; with tables, chairs, and chests of drawers made of unpainted deal. The furniture in all the lodging-houses is of the very simplest construction. We engaged a badediener, or bath-man, to take care of our room, make our fire, and attend us in our baths, for one florin or two shillings each per week. We then hired our beds and bedding by the week, purchased blankets, sheets, and bandages, and bespoke our board in the saloon, or great dining-hall in Priessnitz's establishment, for which we were each to pay nine shillings per week.

'As I shall have frequent occasion to speak of the saloon, which is the great centre of reunion, gossip, and social intercourse for the cure-guests, I may as well describe it here. The saloon is a large and lofty room, about one hundred and twenty feet long, forty feet wide, and twenty-five feet high. It is plainly ceiled, and the walls are whitewashed. In the centre of the west end is the entrance-door, over which is the orchestra for the musical performers at the dinners on Sunday, and at the entertainments occasionally given by the guests. The east end opposite to the entrance is furnished with a portrait of the emperor, and is lighted by four windows in two rows, one above the other. There are also two rows of eight windows each on the south, and two rows of four windows each on the north side. The end of the saloon next the door is occupied with rows of plain deal tables, extending about half way down the length of the room, at which the guests take their meals. These can be laid out to accommodate three hundred guests; but the greatest number who sat down together during my stay did not exceed two hundred. Priessnitz presides at the first of these tables, and it is here that he is generally consulted by such of his patients as board in the saloon. The lower end of the room below the tables is surrounded by sofas, and furnished with several large mirrors, and with a piano. The vacant space between the sofas and the ends of the tables, as well as the space between and around the tables, is used as a lounge and promenade. The saloon is hung round with the flags of fifteen different nations, which have sent patients to Graefenberg. Nowhere will you find a greater variety of character within a small space, than in the saloon at Graefenberg. Attracted thither in search of health from all parts of Christendom, upwards of one hundred individuals sit down to table daily, and the diversity of language, costume, complexion, and manners, may be imagined. Materials for romance, and subjects of absorbing interest to the observer of human nature, lie thickly around you in this little republic—this pure democracy in the midst of a pure despotism. The patients looked so healthy, and ate so heartily, that our first impression was, that there must be some mistake, and that these persons could not be on the sick list. We supped amongst them on the evening of our arrival, and made our arrangements to have an interview with Priessnitz on the following day.'

Priessnitz having examined him, and given directions to his badediener, or attendant, how he should be treated, the process of cure commences. It was on the 12th of January, when the thermometer was nearly at zero, that the first movement was made. 'All my flannels were laid aside; my silk, cotton, worsted, and fur mufflers were thrown off. I was ordered two leintuchs (wet sheets) daily, one at five in the morning, the other at five in the evening, with a cold bath after each. At first, for about a week, I took the abgeshrecktebad (tepid shallow bath) instead of the cold bath, after the leintuch. At eleven A. M. I had a sitzbath (sitting bath) for fifteen minutes. I wore the umschlag (a damp bandage covered by a dry one) round my body, and changed it four times a day. Every morning before breakfast, be the weather ever so inclement, I walked four, six, or sometimes eight miles, and drank six or eight tumblers of cold water. I also took a walk after the sitzbath and evening leintuch, to excite reaction. This treatment lasted for three months. I afterwards took the douche or waterfall bath once a day, and instead of the evening leintuch and cold bath, two abreibungs (wet-sheet baths) at intervals of an hour.'

This perpetual wrapping in wet sheets, rubbing, plunging into ice-cold baths, and exposure in all weathers, was trying, and sometimes painful—the very thoughts of the cold-plunge bath, when lying in bed in the morning, being horror; but the effects were not of the deadly kind which might have been anticipated. 'From the first,' continues our author, 'I found the cure exceedingly stimulating. The various external and internal applications of cold water, the out-door exercise and pure air, which in my walks I allowed to circulate about my neck, throat, and chest as much as possible, had, during the first three months, a most invigorating effect. A rash appeared upon my neck, chest, and shoulders, and around my body under the umschlag, and was rather annoying, from the burning and itching which it occasioned. My cough ceased; I had a voracious appetite; I found that my breathing grew deeper, stronger, and easier, and that I could climb the mountains more rapidly, and with less panting.

'But a painful change was at hand. About the first of April all my joints, and especially my knees, began to grow stiff, sore, and weak; walking became painful; and after sitting a few moments, I found it difficult to straighten my knees. I became gloomy and disheartened, but was assured by those about me that these were favourable symptoms, being evidences that the cure was taking effect. The whole surface of my body, even my hands and face, became very sensitive to the touch of cold water. It seemed as if my nerves were laid bare. I had a perfect horror of cold water—a kind of hydrophobia. As the spring advanced, and the weather grew milder, but damper, the cure became more intolerable. I found the damp weather of April and May far worse than the cold of January and February. I became afflicted with acute and throbbing pain in my teeth, jaws, and face, for which I was directed to rub the back of my head, and my neck and face, with my hands, wet in cold water. I was also ordered to rub my knees frequently in the same way. This was the crisis; and for some weeks I was as miserable as the most enthusiastic admirer of the water-cure could desire. Indeed I was often congratulated on my misery, which was regarded as the prelude to a speedy cure. At the close of April I had boils on my arms, hands, fingers, and chin, and nearly all over my body. They suppurated and discharged; and during the month of May they all healed; and none have since appeared.' And so the cure was completed. While it was going on, 'nothing surprised me more than the perfect safety with which I

cast away my comfortable warm flannels and mufflers. A terrible cold upon my lungs, and an increase of cough, were the least that I expected; but I was agreeably disappointed. In my walks, for three months, I had no hat or cap on my head, no handkerchief around my neck, not even my shirt collar buttoned. My clothes have often been completely drenched with snow and rain, and my hair filled with snow; but I have not had the slightest cold upon my lungs, nor any which a leintuch or one night's rest has not cured. My only remedy has been to take an abreibung, and put on dry clothes, on returning to my room to take off my wet clothes. This simple process has not only saved me from taking cold, but also from the effects of over-exertion. . . . I went to Graefenberg resolved to submit implicitly to Priessnitz's directions. I did so, and was restored to health. I am certain that my long abstinence from all alcoholic and warm drinks, and my disuse of tobacco in all its modes, and of medical drugs, have been powerful aids to my recovery. If any one will make cold water his only beverage, and abstain entirely from the use of medicine, he will find the water-cure sufficient to cure any disease that may assail him; if it be not absolutely incurable, and if he be determined to persevere in whatever process may be requisite for his recovery. But whoever expects to find health by the water-cure while wrapped up in flannels, and lounging in easy chairs and on sofas, in a warm, air-tight room, without personal exertion and activity, will certainly be disappointed; for persevering exercise in the pure fresh air is an essential element of the cure.'

We have thus let our enthusiastic admirer of the water-cure tell his own story, excluding only the details of the different steps in the process, for which we must refer to the work itself. It appears to us that the success of such remedies is in a great measure traceable to what ordinary medical men too frequently neglect—attention to air, exercise, amusement, and diet; or, more properly, the development of the natural powers and functions of the system, some of which, in the ordinary circumstances of an artificial existence, are dormant, or almost extinguished. Why, in therapeutics, there should be so little insisted on in the way of general re-invigoration, by recalling nature to her post, and so much done by the artificial stimulus of medicines, is more than we can understand, unless it be that the duty of prescribing and charging for drugs is a much more easy one than that of studying a man's whole constitution, and giving him rules for keeping it in health. Perhaps, however, the medical profession is not alone to blame. In England and the United States there is a fanatical love of medicines, and men often resort to them as an off-hand mode of cure, having, or thinking they have, no time for more deliberate, though more natural and effectual measures.

Priessnitz, whose proceedings are so much at variance with those of the medical world, is not a physician, neither is he an educated man, and we are informed he is seldom seen with a book in his hand. He writes no prescriptions; all his directions are verbal, and given to the attendants in whose hands he places his patients. Priessnitz, in fact, is nothing more than a German peasant or small farmer; a man with much shrewdness, who studies nature only, and probably never read a book on medicine in his life. Visited by hosts of people, many doubtless with imaginary complaints, and others labouring under the effects of intemperance, late hours, and other excesses of various kinds, he seems to set about restoring the abnormal pith of the constitution by some simple modes of treatment. How far the application of water, internal or external, has a direct curative effect, we cannot pretend to say; but we entertain no doubt that many would recover at home, without water in any extraordinary style of application, if they would refrain from certain indulgences, put away cankering cares, and take plenty of exercise in the open air daily.

In the establishment of Graefenberg there appears to be a studied absence of comfort. Much of the time of the patients is occupied in walking among the hills, drinking water at every spring they pass, and also in hard out-door labour. Sawing wood appears to be one of the occupations most generally admired and followed; many work in the fields; and others, ladies as well as gentlemen, may be seen carrying grass on their backs to the cows. In the evenings, after an early supper, all enjoy themselves with in-door amusements, among which dancing to a band of music is the principal. Ladies who in the morning were working with bare heads and arms in the fields, are now dressed in white gowns, kid gloves, and satin slippers, and going through the mazes of the dance with counts, barons, and captains. In winter, when field-labour is at a stand, sledging is a common recreation; and when tired with this gleesome and rough sport, there are always billiards and other games. 'Concerts are occasionally given in the saloon by some of the guests, at which they sing, play on the piano and violin, and sometimes read extracts from English, German, French, and Italian authors.'

Labour, exercise, and amusement, are thus parts of the cure; and one would almost be inclined to think that a considerable degree of petty discomfort was also indispensable. The buildings are homely, and the accommodations to the last degree mean. 'There are no bedchambers for the servants. The badedieners, both male and female, sleep on the floor in the passages, on straw or in blankets, as the case may be. In going to the baths, both men and women must descend the same public stairs, and thread the same public passages, enveloped in sheets and blankets. One can hardly pass through the establishment at certain times of the day, without meeting guests of all conditions, ages, and sexes, going to or from the baths in this strange attire. The cow-houses and stabling belonging to Priessnitz being under the same roof with the saloon, the offensive exhalations from them are a continual source of annoyance and disgust when the doors of these offices are open, which is frequently the case. Indeed nothing can exceed the discomfort of the whole arrangement, as Englishmen count comfort. Then the work inside is all of the plainest and rudest kind; no painting, no papering, no carpets, no English snuggeries whatever.'

The presiding genius of this half cow-house half dwelling-house, seems by no means underpaid for his services. 'I should suppose,' continues our author, 'that his income, from the weekly rent of his rooms in that part of those houses in Graefenberg which belong to him, amounts to about L.1500 per annum. Then there are at least one hundred guests boarding in the saloon the year round, at four florins thirty-eight kreutzers each, or rather more than nine shillings per week. It is said that the thirty-eight kreutzers are expended in keeping the walks and fountains in order, and that Priessnitz receives the remaining four florins, which, for one hundred guests, comes to something more than L.2000 per annum. This, added to the receipts for lodgings, amounts to L.3500. Then we must add four shillings per week as his fee from each guest, which, at an average of 500 guests, amounts to L.200 [in reality L.100] per week, or L.10,000 [L.5000] per annum, and forms a grand total of L.12,500 [L.8500] per annum. So that, allowing for the expenses of the establishment, Priessnitz cannot have less than L.8000 [possibly L.3500] of clear annual income.'

Our author protests against the assumption that Priessnitz is a charlatan—merely operating for the sake of gain. He describes him as invariably commanding the respect, and winning the affections, of his patients. The Austrian government, however, views his establishment with great jealousy, and would willingly seize on any excuse for putting him down. A register is kept by the police of all the patients who are and have been under Priessnitz's care, recording their names, the places from which they come, and the number of deaths.

Mr Wright was informed that about 10,000 individuals had taken the water-cure at Graefenberg since the opening of the establishment, and that only twenty had died. 'What medical doctor,' he adds 'could point to so small a number of deaths in proportion to the extent of his practice?' If this statement really be consistent with facts (and we do not see any reason to doubt it), the system of Priessnitz ought certainly to engage the careful consideration of the medical profession, with a view to testing its merits.

We take leave of Mr Wright, with thanks for the amusement we have had in perusing his volume, much of which, including some of the doctrines he propounds on general subjects, we do not agree with; but we give him credit for sincerity, and for that still more rare quality in the present age, an honesty in announcing his convictions.

OLIVER CROMWELL VINDICATED BY THOMAS CARLYLE.*

THERE was lately in the London newspapers much controversy touching the propriety of permitting the statue of Cromwell to have a place among the rulers of Britain in the new parliament houses. To many, it seemed that a regicide among kings would not only present an anomalous appearance, but be of bad example; others, disposed to give up the political point, were nevertheless among the objectors, on account of the doubtful character of the individual. In the two bulky volumes now before us, Mr Carlyle presents the documentary evidence upon which a more favourable estimate than usual of the character of Oliver Cromwell is founded. There is perhaps no thinking mind that has not, allowing for the circumstances of the case, often suspected great partiality in the usual historical delineations. Such is the natural horror of regicide, that it was not to be wondered at if a lurid glare were thrown over the portrait of the man and the picture of the events in which he was the principal figure; but still, it was to be expected that there was some basis of truth in the general statements; that they were, at worst, but exaggerations, from which, when due abatements were made, we might get at something near the exact likeness. If, however, we are to adopt Mr Carlyle's account, there is not a single line of the accepted historical narratives that is deserving of the least credit; the whole of them must be negated and repudiated, so that room may be made for one diametrically opposite in all its details, however similar in the mere outline—wholly different in whatever is of essential and vital importance, and as contrary, alike in both minute and large particulars, thereto as a truth is to a lie. Never, therefore, were mankind (and such is the importance of the question involved, that the appeal it includes applies to the race) called upon to an investigation of the historical kind more suggestive, more full of weight and weighty consequence, than that now demanded by Mr Carlyle.

Any popular history will help us to the general impression acknowledged of Cromwell's character. Born of a good family, but early given to dissipation; afterwards pretending religion, and acting the hypocrite with such consummate skill as to deceive the most truly pious; suffering his affairs to fall into ruin 'by the length of his prayers and the general abstraction of his manner;' urged by want to rebellion, fanaticism, and ambition; indebted to accident and intrigue for his success, he thenceforward contrived to build up his fortunes on his country's ruin—waded through blood to the supreme power, being deterred by no crime from the prosecution of his own wilful designs—suffered at the end of his career the agonies of remorse; and though, in his domestic relations after his marriage, altogether exemplary, yet leaving to posterity no better reputation than that of a character which (to give it in the language of the school-books) 'was a compound of all the vices and all the virtues that spring from inordinate ambition and wild fanaticism:'* such is the man as painted to our imaginations, in the customary authorities, from Lord Clarendon's history downwards, whether of more or less pretension. The biographies of Cromwell that exist, Mr Carlyle tells us, are despicable. 'Criticism,' he adds, 'of these poor books cannot express itself except in language that is painful. They far surpass in stupidity all the celebrations any hero ever had in this world before. They are, in fact, worthy of oblivion—of charitable Christian burial.' Perhaps there are few who can compete with Mr Carlyle in this judgment, since he professes to have examined all the original biographies enumerated by Mark Noble for his own compilation—and more also. Of James Heath he speaks with the utmost contempt, calling him 'Carrion' Heath, as being one 'who in fact has no soul, except what saves him the expense of salt; who intrinsically is Carrion, and not Humanity.' For our part, we cannot help thinking that such a style of writing is prejudicial to the end in view, and, but that these volumes are documentary, and not inductive, would go far to destroy the author's credit with the reader. But such faults, grave as they are, fortunately cannot interfere with a book of documentary evidence; and we are bound to add, that never did editor exhibit more pains and sincerity in so editing his documents that the reader should properly understand both them and their relations beyond the possibility of a mistake. Such an editor was especially needed on this occasion, and it is but fair to say that Mr Carlyle has fulfilled every requisition.

The letters and speeches of Oliver Cromwell had indeed been previously edited, but in such a manner as to be worse than useless; because misrepresenting the writer and speaker as one manifestly ignorant and inept; exciting, indeed, the wonder of the merely cursory student, that an individual so incapable of expression should have persuaded parliaments, conciliated authors of supreme genius, and men of unquestionable intelligence, and so swayed the destinies of a great nation as to command general admiration. The plan adopted by Mr Carlyle has removed all the impediments that stood in the way of their intelligibility. He has corrected the old spelling and punctuation, divided them into sentences and paragraphs, indicated the reticencies and deficiencies of incompetent reporters, with such idiosyncrasies in the character of the orator, or the passion of the moment, as would lead to incomplete utterance (that is, incomplete to the reader *now*, though complete enough to the hearer *then*), and added such comments, explanations, and elucidations, as clear up every point that can at all be cleared, and so left the smallest possible amount of obscurity remaining. The result has been, that, though much in these volumes may be obsolete, and beyond the range of modern sympathies, there is scarcely anything but may, with a little patience and earnestness, be brought home and appreciated by the humblest student deserving the name. We are even inclined to give a much higher character to both the letters and speeches of the Protector than Mr Carlyle himself. His account of the former we subjoin:—

'I called these letters good, but withal only good of

* Oliver Cromwell's Letters and Speeches, with Elucidations. By Thomas Carlyle. 2 vols. Chapman and Hall, Strand. 1845.

* This quotation is taken from Dr Mavor's 'History of England,' as presenting a sort of neutral popular statement, in which, moreover, youths are generally educated at school.

their kind. No eloquence, elegance, not always even clearness of expression, is to be looked for in them. They are written with far other than literary aims; written, most of them, in the very flame and conflagration of a revolutionary struggle, and with an eye to the despatch of indispensable pressing business alone; but it will be found, I conceive, that for such end they are well written. Superfluity, as if by a natural law of the case, the writer has had to discard; whatsoever quality *can* be dispensed with, is indifferent to him. With unwieldy movement, yet with a great solid step, he presses through towards his object; has marked out very decisively what the real steps towards it are; discriminating well the essential from the extraneous; forming to himself, in short, a true, not an untrue picture of the business that is to be done. There is in these letters, as I have said above, a *silence* still more significant of Oliver to us than any speech they have. Dimly we discover features of an intelligence, and soul of a man, greater than any speech. The intelligence that can, with full satisfaction to itself, come out in eloquent speaking, in musical singing, is, after all, a small intelligence. He that works and *does* some poem, not he that merely *says* one, is worthy of the name of poet. Cromwell, emblem of the dumb English, is interesting to me by the very inadequacy of his speech. Heroic insight, valour, and belief, without words—how noble is it in comparison to eloquent words without heroic insight!'

We now proceed to give such a representation of Oliver Cromwell's conduct and character as Mr Carlyle has furnished the materials for in his present important publication.

'Oliver Cromwell, afterwards Protector of the Commonwealth of England, was born at Huntingdon, in St John's parish there, on the 25th of April 1599. Christened on the 29th of the same month, as the old parish registers of that church still legibly testify.

'His father was Robert Cromwell, younger son of Sir Henry Cromwell, and younger brother of Sir Oliver Cromwell, knights both; who dwelt successively, in rather sumptuous fashion, at the mansion of Hinchinbrook hard by. His mother was Elizabeth Steward, daughter of William Steward, Esquire, in Ely; an opulent man, a kind of hereditary farmer of the cathedral tithes and church lands round that city; in which capacity his son, Sir Thomas Steward, knight, in due time succeeded him, resident also at Ely. Elizabeth was a young widow when Robert Cromwell married her: the first marriage, to one "William Lynne, Esquire, of Bassingbourne, in Cambridgeshire," had lasted but a year; husband and only child are buried in Ely cathedral, where their monument still stands; the date of their deaths, which followed near on one another, is 1589. The exact date of the young widow's marriage to Robert Cromwell is nowhere given, but seems to have been in 1591. Our Oliver was their fifth child, their second boy; but the first soon died. They had ten children in all, of whom seven came to maturity; and Oliver was their only son.'

The mother of Oliver Cromwell is said to have been descended from the royal Stuart family of Scotland.

'The house where Robert Cromwell dwelt, where his son Oliver and all his family were born, is still familiar to every inhabitant of Huntingdon; but it has been twice rebuilt since that date, and now bears no memorial whatever which even tradition can connect with him. It stands at the upper or northern extremity of the town, beyond the market-place, on the left or river-ward side of the street. It is at present a solid yellow brick house, with a walled courtyard, occupied by some townsman of the wealthier sort. The little brook of Hinchin, making its way to the Ouse, which is not far off, still flows through the courtyard of the place, offering a convenience for malting or brewing, among other things. Some vague but confident tradition as to brewing attaches itself to this locality; and traces of evidence, I understand, exist that *before* Robert Cromwell's time it had been employed as a brewery; but of this, or even of Robert Cromwell's own brewing, there is, at such a distance, in such an element of distracted calumny, exaggeration, and confusion, little or no certainty to be had.'

As to the events of Oliver Cromwell's boyhood, alleged by Heath and subsequent biographers—such as his being run away with by an ape along the leads of Hinchinbrook, his seeing prophetic spectres, robbing orchards, tyrannising over his schoolfellows, acting in school-plays, and such like, Mr Carlyle considers them one and all as stupid inventions. He was, however, educated at the public school of Huntingdon, by Dr Beard, and lived from his infancy under religious influences; to which Mr Carlyle fairly enough adds those proceeding from the public events of the time, such as the Hampton-Court Conference, the Gunpowder Plot, and the general struggle of Protestantism against Catholicism, which of course was then the chief topic of discourse, as it still is of the history of Europe during that period. These are the things which account for the growth of private opinion and principle, though this mode of putting the case is not much adopted by biographers in general. It, however, told with good effect in the 'Life of Savanorola and his Times,' published a year or two ago, and is adopted with similar results in Mr Carlyle's introductory chapters. On the 23d April 1616 (the very day on which Shakspeare died), young Oliver was entered of Sidney-Sussex College, Cambridge; his tutor being one Richard Howlet. At the age of eighteen he was left heir to his father's property, and in charge of his father's family, and, it would seem, consequently left Cambridge; thus early exchanging his speculative studies for practical duties. To these it would appear that he specially attached himself, for the tradition that he was soon after entered of Lincoln's, or any other inn of court, turns out, upon investigation, to be unfounded. He might indeed have studied law a while at the private chambers of some practitioner; but of this, and the kind of life he is supposed to have lived while in town, there is no proof whatever. The supposition is mere calumny, without any foundation at all. At no period of his life, then, was Cromwell a wild liver; and at this particular period he seems to have behaved himself so well, as to have been admitted on visiting terms at Sir James Bouchier's, whose daughter Elizabeth he married 22d August 1620, when he was no more than twenty-one years and four months old. Secured by an early marriage against temptation, he then returned to the home which was both his widowed mother's and his own at Huntingdon, and there applied himself to the business of his farm, labouring for ten years assiduously and honestly, not omitting such civic, industrial, and social duties as his father before him had undertaken.

'In those years it must be,' continues Mr Carlyle, 'that Dr Simcott, physician in Huntingdon, had to do with Oliver's hypochondriac maladies. He told Sir Philip Warwick, unluckily specifying no date, or none that has survived, "he had often been sent for at midnight." Mr Cromwell for many years was very "splenetic" (spleen-struck), often thought he was just about to die, and also "had fancies about the Town Cross." Brief intimation; of which the reflective reader may make a great deal. Samuel Johnson, too, had hypochondrias: all great souls are apt to have—and to be in thick darkness generally, till the eternal ways and the celestial guiding-stars disclose themselves, and the vague abyss of life knit itself up into firmaments for them. Temptations in the wilderness, choices of Hercules, and the like, in succinct or loose form, are appointed for every man that will assert a soul in himself, and be a man. Let Oliver take comfort in his dark sorrows and melancholies. The quantity of sorrow he has, does it not mean withal the quantity of *sympathy* he has, the quantity of faculty and victory he shall yet have? "Our sorrow is the inverted image of our nobleness." The depth of our despair measures what capability and height of claim we have to hope. Black

smoke, as of Tophet, filling all your universe, it can yet by true heart-energy become flame, and brilliancy of heaven. Courage!

'It is therefore in these years, undated by history, that we must place Oliver's clear recognition of Calvinistic Christianity; what he, with unspeakable joy, would name his conversion; his deliverance from the jaws of eternal death. Certainly a grand epoch for a man; properly the one epoch—the turning-point which guides upwards, or guides downwards, him and his activity for evermore. Wilt thou join with the dragons; wilt thou join with the gods? Of thee too the question is asked—whether by a man in Geneva gown, by a man in "four surplices at All-hallow-tide," with words very imperfect; or by no man, and no words, but only by the silences, by the eternities, by the life everlasting and the death everlasting. That the "sense of difference between right and wrong" had filled all time and all space for man, and bodied itself forth into a heaven and hell for him: this constitutes the grand feature of those Puritan old Christian ages; this is the element which stamps them as heroic, and has rendered their works great, manlike, fruitful to all generations. It is by far the memorablest achievement of our species; without that element, in some form or other, nothing of heroic had ever been among us.

'For many centuries, catholic Christianity, a fit embodiment of that divine sense, had been current more or less, making the generations noble; and here, in England, in the century called the seventeenth, we see the last aspect of it hitherto—not the last of all, it is to be hoped. Oliver was henceforth a Christian man—believed in God, not on Sundays only, but on all days, in all places, and in all cases.'

Leaving the reader to make what he can of this statement (involving as it does a religious theory, upon which opinions differ), it is sufficient for the general argument that the facts stated conduces to the proof that Oliver was from the first a sincerely religious man, both in thought and feeling. In further evidence of this, we find him also a contributor to what was called 'The Feoffee Fund'—a scheme originated by Dr Preston, a Puritan college doctor of great celebrity, to counteract the grievance of lay impropriations, through which the country was insufficiently supplied with preachers. The plan was, to *buy-in* such impropriations when possible, support good ministers in destitute places, and otherwise encourage the ministerial work. The wealthy London merchants took it up, and by degrees the wealthier Puritans all over England. The funds thus subscribed were vested in 'Feoffees,' who from time to time proceeded to purchase such advowsons as came to market; and to hire lecturers—'persons not generally in full priests' orders (having scruples about the ceremonies), but in deacons' or some other orders, with permission to preach'—some of them preaching, as supplemental to the regular priest, and some as 'running lecturers,' preaching successively in different districts. Such was their success, that at length they excited the jealousy of Laud, and his proceedings in relation to this matter may be understood as laying the first stone of all the troubles that after followed. He (in Mr Carlyle's words) 'took them seriously in hand, and with patient detail hunted them mostly out; nay, brought the feoffees themselves, and their whole enterprise, into the Star Chamber, and there, with emphasis enough, and heavy damages, amid huge rumour from the public, suppressed them.' Such were the wrongs of which the Puritans had to complain; and Oliver, we learn, 'naturally consorted with the Puritan clergy, and attended their ministry.' Many of the Puritans were gentry of his own rank; some of them nobility of a much higher rank. They were now numerous: among them, John Hampden, his cousin; John Pym; the Lords Brook, Say, and Montague; in a word, 'already, either in conscious act or clear tendency, the far greater part of the serious thought and manhood of England had declared itself Puritan.' Such are the facts in which we are to seek for the sources of Oliver Cromwell's conduct and motives.

It is generally stated that Oliver Cromwell was returned as member for Huntingdonshire in King Charles I.'s parliament (1625); but this is an error. It was his uncle, Sir Oliver, who was then elected, and had been to former parliaments—a fact, however, showing that the family were accustomed to public life and political considerations. This uncle, who was a royalist, was afterwards, being a generous liver, so reduced, as to be compelled to part with his estate.

'The purchaser,' says Mr Carlyle, 'is "Sir Sidney Montague, knight, of Barnwell, one of his majesty's Masters of the Requests." Sir Oliver Cromwell, son of the Golden Knight, having now burnt out his splendour, disappeared in this way from Hinchinbrook; retired deeper into the fens, to a place of his near Ramsey Mere, where he continued still thirty years longer to reside in an eclipsed manner. It was to this house at Ramsey that Oliver, our Oliver, then Captain Cromwell in the parliament's service, paid the domiciliary visit much talked of in the old books. The reduced knight, his uncle, was a royalist or malignant; and his house had to be searched for arms, for munitions, for furnishings of any sort, which he might be minded to send off to the king, now at York, and evidently intending war. Oliver's dragoons searched with due rigour for the arms; while the captain respectfully conversed with his uncle, and even "insisted," through the interview, say the old books, "on standing uncovered;" which latter circumstance may be taken as an astonishing hypocrisy in him, say the old blockhead books. The arms, munitions, furnishings, were, with all rigour of law, not with more rigour and not with less, carried away; and Oliver parted with his uncle for that time, not "craving his blessing," I think, as the old blockhead books say, but hoping he might one day either get it or a *better* than it for what he had now done. Oliver, while in military charge of that country, had probably repeated visits to pay to his uncle; and they know little of the man or of the circumstances who suppose there was any likelihood or need of either insolence or hypocrisy in the course of these.

'As for the old knight, he seems to have been a man of easy temper, given to sumptuosity of hospitality, and averse to severer duties. When his eldest son, who also showed a turn for expense, presented him a schedule of debts, craving aid towards the payment of them, Sir Oliver answered, with a bland sigh, "I wish they were paid." Various Cromwells, sons of his, nephews of his, besides the great Oliver, took part in the civil war, some on this side, some on that, whose indistinct designations in the old books are apt to occasion mistakes with modern readers. Sir Oliver vanishes now from Hinchinbrook, and all the public business records, into the darker places of the Fens. His name disappears from Willis: in the next parliament the knight of the shire for Huntingdon becomes, instead of him, "Sir Capell Bedall, baronet."

'In these same years—for the dates and all other circumstances of the matter hang dubious in the vague—there is record given by Dugdale—a man of very small authority on these Cromwell matters—of a certain suit instituted, in the King's Council, King's Court of Requests, or wherever it might be, by our Oliver and other relations interested, concerning the lunacy of his uncle, Sir Thomas Steward of Ely. It seems they alleged this Uncle Steward was incapable of managing his affairs, and ought to be restrained under guardians. Which allegation of theirs, and petition grounded on it, the King's Council saw good to deny; whereupon Sir Thomas Steward continued to manage his affairs in an incapable, or semi-capable manner, and nothing followed upon it whatever. Which proceeding of Oliver's, if there ever was such a proceeding, we are, according to Dugdale, to consider an act of villany—if we incline to take that trouble. What we know is, that poor Sir Thomas himself did not so consider it; for by express testament some years afterwards, he declared Oliver

his heir-in-chief, and left him considerable property, as if nothing had happened. So that there is this dilemma: If Sir Thomas was imbecile, then Oliver was right; and unless Sir Thomas was imbecile, Oliver was not wrong! Alas! all calumny and carrion: does it not incessantly cry, "Earth, oh, for pity's sake, a little earth!"?

We must inevitably leave the concluding portion of our article till next number.

THE UNHAPPY.

We are not of those who are inclined to denounce this as a miserable world, or who love to magnify its shadows and undervalue or deny its lights and pleasures. No: the earth is full of the beautiful, the animating, and the encouraging; and it is as ungrateful as untrue to imagine that the great Father of the human family has so far forgotten his paternal character, as to doom his children to pass their 'threescore years and ten' in a world where the chief business is to sigh, and the great mass are of necessity to be the unhappy.

And yet it is not to be gainsaid that the majority *are* the unhappy, if their own complaints are to be taken as the only evidence. The complainers immensely predominate, and if any cure could be discovered for grumbling, it would certainly be a great relief to that small minority who are now unceasingly tormented with the complaints of their neighbours. On all sides we hear men murmuring at their circumstances, despising their situation, and nursing and magnifying their troubles; and the less and the more unreal these troubles are, the more provokingly are they obtruded upon others.

There are two great mistakes which men fall into, which seem to us to produce and aggravate this state of things: the first is, the common belief that our happiness depends upon our circumstances and station; and the other, that there are certain favourable conditions in which alone perfect happiness is to be found. The sooner our minds are disabused of these mistakes the better. Circumstances and station have far less power to promote happiness than is generally supposed. We do not wish to be understood as implying that persons may be happy in every situation: there are certain conditions, such as slavery, extreme poverty, prolonged and severe pain, in which it would be unreasonable to expect happiness. But such circumstances as these are the exceptions; the mass of mankind are not in pain, nor extreme poverty, nor slavery. They are placed in those circumstances which are most conducive to happiness; that is, possessing more than a sufficiency of the necessaries of life, and in a situation of labour, either with head or hand, not only having work to do, but work which they *must* do; which we believe will, after all, be found the precise condition most favourable to happiness. Such employment calls forth the energies, keeps the body in healthy activity, preserves the mind from care and anxiety, cherishes feelings of independence, exhilarates the animal spirits, and in every respect promotes the well-being of the entire man.

We therefore assert, that unless this work be very severe, the health infirm, the employment decidedly unadapted to the capabilities and tastes, or the real necessaries of life almost unattainable, a fair share of happiness is within reach, and if it is not found, we had need rather to blame ourselves than our condition —to suspect something wrong in the disposition within, rather than in the circumstances by which we are surrounded. And yet how many sigh for this or that place in society, and refuse to enjoy the present and daily comforts that drop thickly upon their path till that end be attained, and which indeed is rarely the case! Ambition is a ladder whose summit is nowhere, though its base is everywhere, and he who places his discontented foot upon it, is entering upon a course of feverish restlessness, and bidding adieu to settled comfort and enjoyment. The eminence desired becomes only the second step in the ladder, and is but an additional spur to something still more elevated and ambitious; and the higher the point gained, the more fear of retrograding and losing the ground already won. There must be a certain amount of discipline of the passions, a certain amount of self-denial, a certain amount of universal love—in short, an agreement between our convictions of what is right, and our earnest endeavours to practise it; and if this point be attained, it will do more to secure our happiness than any remove of situation or change of circumstances that we can possibly imagine. But where our convictions and our practice are at variance, and the great laws by which we are governed are disobeyed, it is absurd to expect happiness in any position. We will give two or three illustrations of unhappy characters to be met with every day, which may serve to explain more fully what we mean:—

Edward is a young man of some talent certainly, and, with his decent and comfortable circumstances, and his mental capacity of enjoyment, might surely be happy; yet he is not so. He is proud of his intellectual superiority, is eager for a wider sphere to display his talents, and is moody and misanthropic because he thinks his superiority is not sufficiently recognised and admired. The position he desires is that of an idol, and the attitude of his circling friends should be, in his modest estimation, that of humble worshippers. Those that are his equals or superiors he envies, those that are beneath him he despises. Because the world naturally refuses to pay him the homage he claims, he rails at it, and affects to despise that praise which in reality he so much desires to secure. Now, nothing can be plainer than that his unhappiness is his fault, not his misfortune—the result of his own inordinate desires, rather than any real cause of complaint; and that if he would get rid of that sourness that is preying upon his temper and heart, he must revise his principles, moderate his expectations, and refuse not to appreciate that talent in others which he desires to be appreciated in himself, nor to render that respect to his superiors which he expects his inferiors to render to him. He is violating habitually the great laws which his Maker has ordained; and as they will not alter for him, the change must be on his side, and his life and those laws brought into greater harmony: then, and not till then, will he be happy.

Another illustration. My neighbour Temple is a friendless man: he confesses it, he complains of it. He declares that he never met with a mind he could fully sympathise with (and I am sure it is not because his own is so transcendently superior); that mankind are so selfish and so cold that friendship is a thing scarcely to be hoped for. The consequence is, he feels isolated, is melancholy, and suspicious. But has he ever set about making friends in the right way? Has he ever, by acts of good-will, kindness, friendly feeling, himself made proper advances to those whose friendship he complains of not possessing? Is he himself prepared, by self-denial, respect for the feelings of others, and warmth of affection, to play his own part in the harmonious duet of friendship? We are afraid not; we fear his own heart is out of tune—that there is too much pride, misanthropy, doggedness of opinion, and want of delicacy in himself, to allow of his reciprocating the friendship of any one, even if it were thrust upon him. If he wish to be happy, if he would enjoy the blessings of friendship, let him, instead of railing at the 'cold, selfish world,' as he calls it, set it a better example than he has hitherto done; let him come out of his selfishness, his pride, his sarcastic bitterness—let him make proper advances, and he will find friends; and many who come into contact with him will be attracted, and pay back to him with interest his offered love and friendship.

Again: Mr F—— is a large capitalist, and employs in his extensive manufactory upwards of a hundred hands—men, women, and children. He keeps his carriage, lives in a splendid mansion, and if circumstances could make happy, one would think he could scarcely help being so. And yet he has a heavy dis-

satisfied heart, and a countenance more wo-begone or less indicative of enjoyment is not to be seen among all his poor workpeople. How is this? It is the very eminence he looked up to when a young man, the one desire which has influenced him from youth, and yet, as he has risen in station, just in the same proportion has his happiness decreased. The reason of his unhappiness is this: when he was a poor youth, his simple duties were tolerably well performed; industry, patience, self-denial, were exercised, and he was happy. But now his duties have somewhat altered with his change of station; the duties of industry and patience have given place to those of influence and liberality; he is now a man of authority rather than obedience, and many of his new duties are utterly neglected. He is a hard master; the poor creatures he employs by scores are utterly uncared for by him; they are employed by him for his own purposes; he calculates upon a certain profit on the labour of each, and cares not to know anything more about them than as far as they do that work cheaply and effectively. He is continually complaining of unprincipled and dishonest workmen, but he exerts no influence to benefit them, and their conduct at most is but a gross copy of his own selfishness and cunning. They are uneducated, immoral, irreligious, but he cares not; all his thought is to add from the profits of business so many hundreds a-year to that heap of useless treasure which he has already amassed. No wonder there is that scowl on his countenance, no wonder that the nightmare of discomfort sits heavily upon his spirit; he is not doing his duties, nor using his influence and wealth for good. We could prescribe for him. Let him look at his responsibilities and duties honestly; let him break out of that bondage of self which enthrals him, and live for his God and his neighbour; let him remember that these poor workpeople are really his brothers and his sisters, and let him grudge not to appropriate a part of his gains to the rendering their circumstances more comfortable, and their characters more elevated. Let him do this, and he may be happy; but till then, he may tyrannise as he may, hoard as he choose, add hundred to hundred, and acre to acre, but he will still remain what he is now—a useless, selfish, unhappy man.

Such persons as these require not so much, therefore, an alteration of circumstances, as an alteration of themselves: the heart is the deficient mainspring, which throws the whole machinery out of order. The selfish man, the proud man, the avaricious man, must expect to be unhappy, for they are drying up in their own hearts the very sources from which their happiness must flow, if it flow at all. As well might a man put out his lamp, and then complain of the darkness, as such persons put from them the sympathies and charities of life, and then complain of their unhappiness.

The other great mistake—that of supposing that there are some stations and circumstances on earth of perfect happiness, is another fertile source of dissatisfaction. Many seem to imagine that their own station and condition is of all others the most miserable, and that there are others to which, if they could but attain, all their cares and sorrows would vanish. And yet a greater absurdity never found a lodging in the human breast, hope never leaned on a more rotten staff. There is no Goshen in this world where there is light amid the surrounding darkness: pain and pleasure, sickness and health, disquiet and happiness, are scattered among mankind with an impartial hand; none are so high but they must have their troubles; few are so low as not to have their pleasures. The aching head and the feverish pulse are as often found in the palace as in the cottage; the titled lady weeps over her dead child as bitterly as the poor cottager; the master has at the least as many anxieties as his workmen; and trouble, how unwelcome soever the truth, will be found, in one form or other, in every condition. We may change servitude for command, poverty for riches, obscurity for distinction, but perfect happiness will be as distant as ever; and the future will, in any condition, even the most favourable, be chequered with pain and pleasure, the proportions of which will mainly depend upon ourselves. Whatever our situation may be, it is what we are, and not what we have, that must constitute our happiness. Let us make the most of the comforts which Providence has placed within our reach, cultivate happiness in ourselves, increase it as much as we can in all around us, and seek it in the knowledge and obedience of Him who is its source. If at any time we should feel unhappy, let us review our principles and our practice, and see if the fault be not rather within than without, and remember that, by whatever name we may seek happiness, whether pleasure, honour, power, or wealth, we shall seek her quite in vain, except under the familiar and too often repulsive name of—Duty.

WATER-CRESS.

Most persons are acquainted with the water-cress and its salutary properties; they know generally that it grows in brooks, and on the borders of fresh and running streams. Few, however, of those who, in the busy thoroughfares or quiet suburbs of London, hear the cry of 'water cre-e-ses,' or see in their daily walks the old red-cloaked women sorting the little bundles at the corners of streets, have any idea that the cultivation of this esculent now forms an important branch of horticultural and commercial industry; which, from the increasing consumption, and use made of the plant in pharmacy, is gradually rising into consequence.

In the present day, the water-cress may be found on almost every table, from the highest to the lowest. It is one of the most powerful antiscorbutics with which we are acquainted, and is said to possess the property of exciting the appetite and fortifying the stomach. We have no certain information that it is cooked in any part of England, as is occasionally the case in France; but in the north of Germany, to which country we owe its original cultivation, it is boiled and eaten as spinach.

In an old botanical work,* we are told that the watery part of Tothill Fields, Westminster, was overrun with water-cress, and that it grew on the banks of the Thames in several places. The same work also enumerates many places in England where this refreshing vegetable was abundant; and it is now known that, like many other of the simple but useful productions of nature, which, in their natural varieties, abound wherever they may be beneficial to man, it is to be found in most parts of the world.

It is of the Cruciferous family, which comprehends about twenty species, all possessing high antiscorbutic properties, and of the genus *Nasturtium*, 'said to have been so called from the effect its acrimony produces on the muscles of the nose—*nasus tortus*, signifying a convulsed nose.'† The common cress is known as *Nasturtium officinale*, and presents two varieties, the green and the blue, which by cultivation have been rendered far superior to what they were in their wild state; being less acrid, and not so liable to contract the taste of slime and mud as those found in ditches and marshes.

Fifty years ago, a considerable proportion of the supply that found its way to the metropolitan market was gathered from the numerous little streams which intersect the meadows near the towns of Newbury and Hungerford, in the county of Berkshire, from which places it was brought in sacks by the stage-coachmen of the day, who shared in the profits of the sale. The first attempts at regular cultivation in the neighbourhood of London, appear to have been made in the year 1808 at Springhead, a village near Gravesend. This plantation still exists, and is sometimes visited by the frequenters of the well-known semi-watering-place just mentioned, for the purpose of regaling themselves with a fresh-plucked salad and bread and butter. Another planta-

afterwards commenced in Surrey, but subsebandoned. The culture, however, continued particularly in localities favourably situated rd to springs of water. Near Rickmansworth, rdshire, where there is a fine stream running ılky bottom, there are now about fifteen acres tivation. The Springhead plantation consists res, while on the opposite side of the Thames, ım Abbey, in Essex, is another of six acres. ough extensive, are insufficient to meet the f the huge metropolis. Other supplies are obn greater distances. From Uxbridge and Salist quantities are forwarded to London, packed s, every day in the year excepting Sundays; idea may be formed of the enormous confrom the sum-total of the annual sales, which o more than L.10,000.

ılture of cress requires much attention and ess, especially in winter, in which season, ingle night, a sharp frost may destroy a whole , if too remote from the springs to retain temperature. The ground is generally laid allel trenches, separated by small mounds, on culent vegetables may be grown. The bottom covered with several inches of sandy vegeh, perfectly level and equalised, so that the y have a regular flow in every part. The March and August are the most favourable g in the plants, which are generally set in r tufts, eight or ten inches apart. A wellench will be in full bearing after the first year, to the temperature of the water and the na- soil. The activity of the vegetation depends ly on the state of the atmosphere; but if the has been made with care, and the plants well will require no other precautions, with the of occasional weedings, than those necessary t from winter frosts, and the irruption of foul y water in thaws and storms.

urable seasons the cress may be gathered ee weeks; but in cold weather, two months imes required to bring the plants to perfection. e gatherings, it is customary to roll and level n of the trench, or to manure when required. lantation will last a long time; but it should d by the same process as at first, whenever it ns of decay. Sometimes, in frosty weather, y of water is increased until the plants are y covered; but as this submersion weakens hould not be continued longer than absolutely

udon describes the process as follows:— arket gardeners, who can command a small water, grow the water-cress in beds sunk ot in a retentive soil, with a very gentle slope end to the other. Along the bottom of this h may be of any convenient length and chalk or gravel is deposited, and the plants ed about six inches every way. Then, accordslope and length of the bed, dams are made s high across it, at intervals; so that when s are full, the water may rise not less than hes on all the plants included in each. The g turned on, will circulate from dam to dam; plants, if not allowed to run to flower, will ndance of young tops in all but the winter A stream of water no larger than what will of an inch bore, will, if not absorbed by the e to irrigate in this way an eighth of an some of the plants are apt to rot off in winter, tion should be laid dry two or three times a l all weeds and decayed parts removed, and filled up. Cress grown in this way, however, rior to that grown in a living stream flowing el or chalk.'

story of the cultivation of this plant on the affords some interesting particulars, which exemplify the advantages that accrue, with proper attention, from the apparently humblest objects. About the beginning of the present century, an attempt was made to form cress grounds in the neighbourhood of Paris, similar to those then common on the banks of the Rhine, by the Count de Lasteyrie; but without success; while the markets of that capital were supplied only by persons who travelled to distances, sometimes of forty leagues, collecting the cress wherever it could be found. The supply was seldom sufficient to satisfy the limited demand, although it frequently consisted of nothing more than bunches of marshy plants masked by a few sprigs of the genuine vegetable.

In the winter of 1809, Monsieur Cardon, then principal director of the hospital chest of the grand army, was quartered with his staff at Erfurt, the capital of Upper Thuringia. Walking one day in the environs of the city, when the earth was covered with snow, he was astonished by the sight of several long trenches, from ten to twelve feet in width, covered with the most brilliant green. Curious to know the cause of what appeared to be a phenomenon at that season, he walked towards them, and perceived with the greatest surprise that the trenches formed a large plantation of watercress, presenting the aspect of a verdant carpet on a surface in every direction white with snow. In answer to his inquiries, M. Cardon learned that the plantations had existed for many years, and belonged to the authorities of the city, from whom they were rented by the cultivators at the annual sum of L.2400. Since that time, however, their value has greatly increased. From a statement published in 1830, we find that the annual return then amounted to more than L.8000; and that the cress, highly esteemed for its purity and superior qualities, was sold in all the cities on the Rhine, and in the markets of Berlin, at a distance of 120 miles from the place of its growth.

M. Cardon foresaw the benefits that might be expected to arise from the introduction of this branch of horticultural industry into the neighbourhood of Paris; and, after a long search, found twelve acres of a thin sandy alluvium at St Leonard, in the valley of the Nonette, between Senlis and Chantilly, which, containing many beautifully limpid springs at a temperature of 59 degrees, appeared to be well adapted for a cress plantation. He engaged two well-informed individuals from Erfurt who were acquainted with the method of cultivation. The ground was laid out in trenches of 250 feet in length by 12 feet in breadth; which, were, however, afterwards reduced to one-half of those dimensions, as it appeared that the water lost its natural temperature, and froze in the winter, by flowing over so large a surface. In a few years, after an expenditure of L.3200, there were 92,000 square feet under cultivation.

It was no longer the cress clandestinely gathered, often in flower, or run to seed, that was exposed for sale in the French metropolis. The cress of St Leonard arrived, packed with a care to which the Parisians were strangers. Its freshness and purity were such, that the market-women, of their own accord, offered double the usual price before any demand had been made; and, in testimony of their high satisfaction, feasted the journeyman cultivator who had come to superintend the sale, and the wagoner, and sent them home decorated with ribbons and flowers.

Much greater precautions appear to be taken in the packing and transport of the cress in France than in this country. The French growers are particularly careful in warm weather, and guard the plants from exposure to the least storm, as they then turn yellow. They pack them in baskets, which contain from twenty-five to thirty dozens of bunches, so arranged as to leave a circular opening or chimney up the centre, which always remains empty. The baskets are then placed on rails fixed across a wagon, so as to permit a free current of air through all the openings; and in the summer, before putting on the tilt, the whole are well watered, to preserve their freshness during the night,

and they are delivered at the market early in the morning in the most perfect condition.

The regularity of the arrivals and constant freshness of the cress sent every day from the grounds at St Leonard, not only insured the success of the scheme, but brought forward a host of competitors. M. Cardon's German workmen left him to commence rival establishments; and there are now in the environs of Paris sixteen plantations, producing annually 1,350,000 dozens of bunches, valued at L.37,800; and, adding the charges of transport, and expenses of all the individuals employed in this branch of trade, which, a few years ago, had no existence, the sum actually circulated amounts to not less than L.60,000.

Formerly, the sale in Paris seldom amounted to more than L.20 daily in the best season; while at the present time, a supply of not fewer than twenty wagon-loads, worth L.240, is required to meet the daily demand.

Column for Young People.

VIRTUE AND GENEROSITY.

FROM THE FRENCH OF MADAME GUIZOT.

Monsieur de Flanmont.—Would you like, my children, to hear two stories of robbers that I have read in an English magazine?

Children.—Oh yes, papa; are they very long?

M. de Flanmont.—No; but I think you will be a good deal puzzled to give me your opinion of them.

Children.—How so, papa?

M. de Flanmont.—You shall see. Here is the first. An English stage-coach, full of passengers, was travelling towards a large town. The conversation fell on the subject of highwaymen, who frequently robbed travellers upon that road, and they began to inquire of each other how they would be able to save their money in case of an attack; when all declared that they had taken precaution, and were safe. A young woman of the party, with more candour than prudence, exclaimed, 'Though I have all I am worth in the world with me (bank-notes for two hundred pounds), yet the robbers could never find them; they are inside the foot of my stocking.' A few minutes after, the coach was attacked, and the passengers were ordered to deliver their purses. The robbers found so little money in them, that they were much dissatisfied, and declared that, if they did not immediately get a hundred pounds, they would search them strictly, and give them some rough treatment. They were about to execute their threats, when an old man who sat in a corner of the coach, and had hitherto scarcely uttered a syllable, said, 'You will find double the sum you demand if you will only make that lady take off her shoes and stockings.' The robbers followed his advice, took the notes, and went off. What do you say of this old man?

Clementina.—Ah, papa, what wickedness!

M. de Flanmont.—All the passengers thought as you do. They loaded him with reproaches and abuse, and threatened to throw him out of the coach. The grief of the young woman was beyond description. The old man seemed insensible to their abuse and their threats; the only excuse he made was, that every one had a right to take care of himself. When the coach arrived at the town in the evening, the old man got off before any of his companions had time to make him feel their vengeance. The young woman spent a sorrowful night; but what was her surprise when, the next morning, she received four hundred pounds, a very beautiful comb, and the following letter:—

MADAM—The man whom you had yesterday so much reason to detest, sends you the sum which you lost, interest to double the amount, and a comb of nearly equal value. I am grieved at the trouble I was under the necessity of giving you; but a few words will explain my conduct. I have just returned from India, where I spent ten years of hardship; the fortune I realised there amounts to thirty thousand pounds, the whole of which I had in bills yesterday in my pocket. If I had been searched with the strictness which was threatened, I should have lost all. What was to be done? I could not run the risk of being obliged to return to India empty-handed. Your candour furnished me with the means of averting this calamity: I beg, therefore, that you will not scruple to accept this little present, and that you will believe me ever to remain your devoted servant, &c. &c.

Gustavus.—Ah, papa, the young woman had no longer any reason to complain; and the old man was not to blame, since he gave so much more than she had lost.

Clementina.—Yes; but if I had been in her place, I would rather not have been obliged to take off my shoes and stockings before the robbers.

Gustavus.—Oh, that did not do her much harm.

Henry.—But, papa, if the robbers, notwithstanding their promise, had searched every one strictly, and had taken from the old man his thirty thousand pounds, he would not have been able to return the young woman her two hundred pounds, and he would have been the cause of her losing it.

M. de Flanmont.—Henry is right: the old man did a positive injury, without having any certainty of being able to repair it.

Henry.—Of course no confidence can be placed upon the word of a robber.

Gustavus.—But then he was sure that if he did not do that, they would have taken from him his thirty thousand pounds.

M. de Flanmont.—That is true; but do you think, my dear Gustavus, that we are permitted to save ourselves from any great misfortune, by causing one equally great to another? For, after all, the loss of the two hundred pounds was as great a misfortune to the young woman, as the thirty thousand would have been to the old man, as it was her whole fortune.

Gustavus.—Yes, papa, but he knew that he would return it.

M. de Flanmont.—He intended it, no doubt; but Henry has shown you that it might not have been in his power to do so. Other accidents might have occurred to prevent him, he might have lost his pocket-book on the road, or he might have died suddenly, &c.

Clementina.—Oh yes; and then the young woman would have had neither her two hundred pounds, nor the other two hundred pounds, nor the beautiful comb.

M. de Flanmont.—He would also have left his integrity, and the fate of his fellow-traveller, to the chances of the future—necessarily uncertain—and all to spare himself a misfortune which, though undoubtedly a great one, he had no right to evade by causing one equally great to another. It is here where the difference lies between prudence and virtue: prudence begins by considering the best means of getting out of a difficulty, and thinks it enough to make reparation for any evil it has caused to others: virtue is not satisfied with the hope of being one day able to repair an injury; it will not commit one, and therefore, though it may be sometimes less fortunate, is always more peaceful. It is by doing wrong, even with the prospect of good arising from it, that men fall into difficulties, and often into errors, from which they can never be extricated. However prudent a person may be, he cannot flatter himself that he has foreseen every consequence that may arise, or know that some of them may not be very disastrous; whilst, by imposing on ourselves the law of being first virtuous, we possess the certainty of never doing an injury to any one with which we can afterwards reproach ourselves for being the cause.

Gustavus.—But, papa, what ought he to have done?

M. de Flanmont.—I do not know; all that I am sure of is, that we ought not to do as the old man did. You will some day see for yourself how many misfortunes happen in the world by the false notion men so often entertain, that they can arrange and direct events to suit their own purposes: they regulate their conduct according to this expectation; and afterwards events multiply, become so entangled, happen in such unexpected ways, that they often see their projects fail, as their virtue invariably does, and they are unable to recover themselves. We ought, on the contrary, first to secure our integrity, and afterwards take what advantage we can of circumstances; besides, who knows what resources may be presented to the mind of a man firmly determined not to do anything against his conscience? It is undoubtedly very convenient to make use of the first means that offer themselves, but can we be sure that they are the only means, and that, were we to take a little more pains, we might not find another equally efficacious and more creditable? Whoever holds fast his integrity, and is, besides, active and industrious, will almost always get out of difficulties. I do not at this moment see in what way the old man could have saved his

thirty thousand pounds; but perhaps, if he had not so immediately determined on informing against the young woman, some other expedient might have been presented to his mind that would have been much better.

Gustavus.—I agree with you, papa; but you promised us another story.

M. de Flammont.—Here it is. You will now see, that if we must not do an injury that we can never be sure of repairing, neither must we do wrong even with the best intention. An English nobleman, on his way from London to one of his estates, was stopped in a wood by six robbers. Two of them seized the coachman, two others the footman, while the remaining two, placing themselves on each side of the carriage, presented pistols to his head. 'Your pocket-book, my lord,' said one of the robbers, who was a hideous-looking fellow. His lordship drew from his pocket a tolerably heavy purse, and gave it to the robber, who felt its weight, and appeared dissatisfied. 'Your pocket-book, my lord,' said he again, and presented his pistol. His lordship quietly delivered his pocket-book, which the robber opened, and, while doing so, the nobleman had time to examine his countenance: he had never seen such small and piercing eyes, so long a nose, such hollow cheeks, so large a mouth, or so prominent a chin. The robber took some papers out of the pocket-book, and then returned it. 'Good journey, my lord,' said he, and withdrew immediately with his companions.

On reaching home, his lordship examined his pocket-book to see what had been taken, and found he had been robbed of two thousand five hundred pounds, and that there was left in it five hundred pounds. He congratulated himself upon that, and told his friends that he would willingly give a hundred pounds that they might see the fellow. Never had highwayman a countenance better adapted to his trade. The nobleman soon forgot his loss, and thought no more of the matter, when, some years afterwards, he received the following letter:—

My Lord—I am a poor Jew. The prince of the states in which I resided deprived us of everything. I came, with five other Jews, to England, in order to save my life. After suffering severely at sea, the ship we were in was wrecked near the coast. An Englishman, a perfect stranger to me, swam to my assistance, and saved my life at the peril of his own. Nor was this all; he took me to his home, called in a doctor, and had me taken care of till I was quite recovered; and for all this he asked me no remuneration. This man was a woollen-factor, and had twelve children. Some time afterwards I found him in great grief. Disturbances had broken out in America, and the American merchants with whom he was connected were dishonest enough to take advantage of circumstances, and not pay him. In one month, said he, I shall be ruined, for I expect draughts upon me which I am totally unable to meet. His grief drove me to distraction; I took a desperate resolution; 'I owe my life to him,' said I, 'and I will sacrifice it for him.' With the five Jews who accompanied me to England, I took my stand upon the high-road—you know what followed. I sent my benefactor the money I took from you, which saved him for that time; but his creditors did not pay him in the end. He died a week since, without having been able to clear off all his debts. On the same day I gained a prize in the lottery, of four thousand pounds. I now return you the sum of which I robbed you, with the interest of it. Send the thousand pounds which remain to the factor's unfortunate family (whose address I will give you at the end of my letter), and inquire of them respecting a poor Jew who was generously received and saved by them.

P.S. I declare to you, that when you were attacked, not one of our pistols was loaded; neither could our cutlasses be drawn from the scabbard. Spare yourself all search or inquiry. When this letter reaches you I shall be again at sea. May God preserve you!

The nobleman made inquiry, and found that what the Jew had stated was true in every particular, and from that time he took care of the factor's family. I will give a hundred pounds, he would often say, to whoever will bring me information of the death of my frightful Jew, and a thousand pounds to whoever will bring him to me alive.

Henry.—Why did he wish to hear of his death, papa?

M. de Flammont.—Because this Jew was in reality a dangerous person to society. A man capable of resorting to such an action, even from the best motives, is always a person to be feared. The safety and happiness of society depend on respect and submission being paid to the laws, which preserve its order, by defending the person and property of every one. The laws cannot enter into an examination of the motives which may induce one individual to attack the person or property of another. Had the nobleman been a judge, and the Jew brought before his tribunal, he could not (even though he knew his whole history) do otherwise than condemn him to the penalty prescribed by the law, except by endeavouring to procure for him the pardon of his sovereign.

Gustavus.—The Jew had not, however, loaded his pistols; he would not commit murder.

M. de Flammont.—He would consequently have suffered a less severe punishment than that inflicted upon assassins; but he was not the less a robber.

Clementina.—Yes; but it was to save his benefactor that he risked his own life, out of gratitude. It was surely a great sacrifice; he would not have robbed for anything else.

M. de Flammont.—Undoubtedly this Jew was susceptible of the most generous sentiments and the greatest devotedness, and this ought to weigh a great deal with us in forming our opinion of him. It would also most probably procure him his pardon, or at least a great mitigation of his punishment; but for morality, and the interests of society, firm and correct principles are more essential than fine feelings. We cannot allow individuals to adopt what measures they please, to gratify their feelings or display their generosity. Even virtue must be subservient to those laws which wisdom acknowledges to be of incontestable advantage, and that marks the way in which it may be exercised, and the barriers that it must not pass. Thus, in the conduct of our Jew, in all that preceded and followed his act, there were circumstances that were even praiseworthy: he only wanted to save his benefactor; he took no more than he required for that purpose; he kept nothing for himself; and even scrupulously repaid both the sum and the interest of it; he did not even keep a farthing of what he gained in the lottery, as, after having repaid the nobleman, he gave what remained to the children of his benefactor. All this is very fine, very disinterested, but it does not prevent the action itself from being blameable; and it is what often occurs when people allow themselves to be governed by their feelings, let them be ever so good, instead of regulating their conduct by the steady immoveable principles which sometimes restrain the feelings, but always insure our virtue.

Henry.—Yet, papa, the nobleman promised more to him who should bring him the Jew alive, than to him who should bring the account of his death.

M. de Flammont.—Because he well knew that a man who was capable of such strong and devoted feelings, was one who only required stronger principles, and a less embarrassing situation, to become a person of distinguished virtue. He undoubtedly intended to teach him that, if it is noble to sacrifice our life to a benefactor, that this sacrifice should never be made at the expense of our virtue. He perhaps also wished to attach him to himself, and relieve him from the difficulties of his situation, which had caused him to consider generosity of feeling of more importance than strict principles of justice. Generosity may lead us even farther than duty, but it should never take us out of the direct line, or make us deviate in the slightest degree from the straight path of virtue.

CONDUCT TOWARDS INFERIORS.

Nothing shows a greater abjectness of spirit than an overbearing temper appearing in a person's behaviour to inferiors. To insult or abuse those who dare not answer again, is as sure a mark of cowardice, as it would be to attack with a drawn sword a woman or a child. Wherever, therefore, you see a person given to insult his inferiors, you may assure yourself he will creep to his superiors; for the same baseness of mind will lead him to act the part of a bully to those who cannot resist, and of a coward to those who can. But though servants and other dependents may not have it in their power to retort the injurious usage they receive from their superiors, they are sure to be even with them, by the character they spread abroad of them through the world. Upon the whole, the proper behaviour to inferiors is, to treat them with generosity and humanity, but by no means with familiarity on the one hand, or with insolence on the other.—*Dignity of Human Nature.*

EMULATION.

Those natural inclinations of the human mind ought to be encouraged to the utmost (under proper regulations) which tend to put it upon action and excelling. Whoever would wish his son to be diligent in his studies, and active in business, can use no better means for that purpose than stirring up in him emulation, a desire of praise, and a sense of honour and shame. Curiosity will put a youth upon inquiring into the nature and reason of things, and endeavouring to acquire universal knowledge. This passion ought therefore to be excited to the utmost, and gratified, even when it shows itself by his asking the most childish questions, which should always be answered in as rational and satisfying a manner as possible.—*Dignity of Human Nature.*

PROMISERS.

There is a sort of people in the world of whom the young and inexperienced stand much in need to be warned. These are the sanguine promisers. They may be divided into two sorts. The first are those who, from a foolish custom of fawning upon all those they come in company with, have learned a habit of promising to do great kindnesses, which they have no thought of performing. The other are a sort of warm people, who, while they are lavishing away their promises, have really some thought of doing what they engage for; but afterwards, when the time of performance comes, the sanguine fit being gone off, the trouble or expense appears in another light; the promiser cools, and the expectant is bubbled, or perhaps greatly injured by the disappointment.—*Burgh.*

HABITS OF THE PUMA.

The puma, or South American lion, has a wide geographical range in that continent, being found from the equatorial forests, throughout the deserts of Patagonia, as far south as the damp and cold latitudes of Terra del Fuego. I have seen its footsteps in the Cordillera of Central Chili, at an elevation at least of 10,000 feet. In La Plata, the puma preys chiefly on deer, ostriches, bizcacha, and other small quadrupeds; it there seldom attacks cattle or horses, and most rarely man. In Chili, however, it destroys many young horses and cattle, owing probably to the scarcity of other quadrupeds. I have heard likewise of two men and a woman who had been thus killed. It is asserted that the puma always kills its prey by springing on the shoulders, and then drawing back the head with one of its paws, until the vertebræ break. I have seen in Patagonia the skeletons of guanacos with their necks thus dislocated. The puma, after eating its fill, covers the carcase with many large bushes, and lies down to watch it. This habit is often the cause of its being discovered; for the condors wheeling in the air, every now and then descend to partake of the feast, and, being angrily driven away, rise all together on the wing. The Chilian then knows there is a puma watching his prey; the word is given, and men and dogs hurry to the chase. It is asserted that if a puma has once been betrayed by thus watching the carcase, and has then been hunted, it never resumes this habit, but that, having gorged itself, it wanders away. Unlike many of the feline family, it is easily killed. In an open country, it is first entangled with the bolas, then lassoed, and dragged along the ground till rendered insensible. At Tandeel, south of the La Plata, I was told that within three months one hundred were thus destroyed. In Chili, they are generally driven up bushes or trees, and are then either shot or baited to death by the dogs. The dogs employed in this chase belong to a peculiar breed called Leoneros: they are weak, slight animals, like long-legged terriers, but are born with a peculiar instinct for this sport. The puma is described as being very crafty: when pursued, it often returns on its former track, and then suddenly making a spring on one side, waits there till the dogs have passed by. It is a very silent animal, uttering no cry even when wounded, and only rarely during the breeding season.—*Darwin's Journal.*

INFLUENCE OF VEGETABLE DIET ON LONGEVITY.

It is said that in no other part of the world (in proportion to the population) are there more instances of extreme longevity than among the Norwegian peasantry, who scarcely ever taste animal food. In the severe climate of Russia also, where the inhabitants live on a coarse vegetable diet, there are a great many instances of advanced age. The late returns of the Greek church population of the Russian empire, give (in the table of the deaths of the male sex) more than one thousand above a hundred years of age; many between one hundred and a hundred and forty; and four between one hundred and forty and one hundred and fifty. It is stated that, to whatever age the Mexican Indians live, they never become gray-haired. They are represented as peaceable cultivators of the soil, subsisting constantly on vegetable food; often attaining a hundred years of age, yet still green and vigorous. Of the South American Indians Ulloa says—'I myself have known several who, at the age of a hundred, were still very robust and active, which unquestionably must in some measure be attributed to the perfect sameness and simplicity of their food.' Both the Peruvian Indians and the Creoles are remarkably long lived, and retain their faculties to a very advanced age. Slaves in the West Indies are recorded from a hundred and thirty to a hundred and fifty years of age.—*Smith's Fruits and Farinacea.*

THE POET'S MISSION.

Weaving light fancies, lay a youthful poet,
Idly extended on the sunny grass,
Listening unto the brook that ran below it,
Watching the cloudlets o'er the blue sky pass.

Sleep fell upon him, and a low voice stealing,
Breathed his own songs—vague dreams, ideal woes;
Until in nobler strain the music pealing,
Diviner far the god-like song uprose.

'Is this,' it said, 'the heaven-born poet's mission,
Ingloriously to dream away the hours?
Forgetful of his spirit's home Elysian,
To taint its freshness, grovelling in earth's bowers?

Behold the glorious work becomes the poet!
To scatter wide the light his soul within;
To lift his voice for truth, that men may know it;
Unto the pure and good all hearts to win:

To be, as was of old, the poet-preacher,
And Orpheus-like to strive 'gainst might and wrong;
In his own life becoming a mute teacher;
Cheering the weak and suffering by his song.'

The strain died faint away in distance slowly;
The poet rose—a dreamer now no more;
And boldly entered on his course most holy,
To linger not, nor cease, till life be o'er.

COLOSSAL MANUFACTURING ESTABLISHMENT.

There is now in full operation at St Petersburg perhaps the most extraordinary, as well as gigantic, commercial establishment which can be found in the history of the world, ancient or modern. Messrs Eastwick and Harrison, the famous locomotive engine and boiler makers of Philadelphia, having succeeded in obtaining the great contracts for the construction of the locomotive requirements for the system of railroads about to be carried out in Russia, have located themselves there—built a manufactory of immense extent, in which 3500 men are constantly employed, and in the conducting of which there are some curious features. To keep order among such a congregation—exceeding the whole population of a good-sized town, and consisting of English, American, Scotch, Irish, German, and Russian—a company of soldiers is kept on duty at the works, and a perfect police force, whose duties are confined to the establishment. Refractory men of every nation are discharged for irregular conduct, excepting Russians, and these are, for the slightest offence, immediately tied up to the triangles, soundly flogged, and sent again to their work. It is but justice to Messrs Eastwick and Harrison to say, that they have strongly appealed against this treatment, so peculiar to this semi-barbarous nation, but without effect. The plan of paying this enormous multitude is ingenious: on being engaged, the man's name is, we believe, not even asked, but he is presented with a medal, numbered; in the pay-house are 3500 wooden boxes, and on presenting himself on Saturday night for his pay, the clerk hands him his money, takes his medal as a receipt, which is dropped in the box of its number, and gives him another medal, as a pledge of engagement for the following week.—*Mining Journal.*

JOURNEY TO MOUNT SINAI*

ıG Suez, and sailing along the eastern shores of d Sea, we arrived at Tor—intending to proceed to Sinai, which is distant about two days' jour- and, at a camel's walk. While waiting for the which were to convey us to our destination, uently resorted to the famous *Waddy Moosa*, or of Moses, for the purpose of bathing in a hot which tradition asserts to have been used as by the great Jewish lawgiver. The *Hummum* or Bath of Moses, is about ten feet square and p, partly enclosed with stones; and the waters, h they emit a highly sulphurous odour, are, in ience of their temperature, exceedingly agreeable bather. The exact spot at which the Israelites through the Red Sea, in their flight from Egypt ter of controversy; but travellers have generally ed that the *Waddy Moosa*, with its wells and its us palm-trees, is identical with the Elim of the narrative, where the Israelites, wearied of the aters of Marah, encamped, having found 'twelve f water, and threescore and ten palm-trees.'

is a wretched collection of hovels built of gray nd mud; and so close to the water's edge, that ing at the petty embankment, consisting of stems palms laid along blocks of coral, whose duty it ist the inroads of the sea, one could not help ming an idea of insecurity. The inhabitants, r, do not appear to be at all incommoded by such tion. They are an indolent race of Greeks, con- of about a dozen families, whose spiritual interests nded to by a priest from the monastery of Mount the contented occupant of a domicile not less l than those of his parishioners. Fishing, the dates, and the supplying of water to such ships h at the spot, constitute their chief means of od.

th, 1839.—Our camels having arrived, we left d striking into the *Waddy Moosa*, halted at the f Elim, to fill our sheep-skins, and give our drink. In this we lost much valuable time; for ıbs, accustomed to regard water as the prime ry for a journey, insisted upon taking in the supply here, though they knew we should meet ndance of it next morning.

had just extricated ourselves from the multipli- small ravines formed in the chalky soil of the and were entering another water-course, on the side of which lay an extensive plain, when dark- me on. By the advice of our Arabs we came to until the moon should appear. Unbuckling our mattresses, blankets, and cloaks, we sought for the softest places of the water-course to spread them in, while our servants prepared coffee—our Arab conductors doing the same for themselves. I was sipping the refreshing beverage, when one of my companions drew attention to the picturesqueness of the scene before us. There sat the Arabs around their fire, which was casting up its ruddy glow against the bank under which they had chosen their resting-place, and ever and anon flashing upon some of their bronze faces—bronze both in their natural hue, and in the imperturbable gravity of their expression: near them were the camels, in their meek and patient attitudes of repose. The savage and dimly-discerned scenery around, harmonised in a strange but effective manner with the little warm picture which it enclosed, the only foliage visible, that of the shaggy tamarisk, constituting a principal feature in the whole. The first artists of Europe might have envied us the pleasure of such a sight. Upon me the effect produced was exactly that 'jocund and boon' sensation which I recollect as having been described by a young Frenchman whose travels formed part of my boyish reading. Not having seen Laborde's splendid work at the time of my journey, I was not then aware that the power of causing this peculiar sensation is held to be characteristic of Arabian scenery. In contradiction, indeed, to this observation, I was informed afterwards by one of my companions, a man of highly-cultivated mind, that the emotions experienced by him on the occasion, and which he considered to be alone appropriate, were those of a wild inexpressible melancholy. Laborde, I believe, has remarked on similar instances which came within his own knowledge, of contrary effects being produced on different minds by the same scenery; and the subject is certainly a curious one. As for me, in addition to the 'jocund and boon' sensation which I have mentioned, there soon rose another of a different kind. I felt in a more profound manner than ever I had done before my historical relationship to the past ages of the world, to those ancient Israelites wending through this same wilderness, and bearing on, within the bosom of their singular economy, a load of blessings for all mankind. Here was I on the ground which they had trodden, and under the same sky which had canopied them, without, it is true, the pillar of fire by night, but not without the presence of Him who led them in all their wanderings, and bore with all their perverseness.

The moon rose about eleven o'clock; and, greatly refreshed by our short repose, we recommenced our journey, having previously, however, had recourse to the never-failing coffee. After a few hours of travel, day dawned upon us as we were in the middle of an extensive stony plain; after traversing which, we entered the mountain ravines which lay beyond it. These *waddies*

* paper has been forwarded to us by Captain Michael Max- ow, of the Indian army.

or water-courses vary in breadth from twenty to eighty yards, and though dry at the period of our journey, presented the appearance of having recently been filled with water. I was informed, however, that it is only after the melting of unusually deep snows on the hills that they exhibit any considerable stream—a circumstance which happens probably once in five years. If embankments of masonry, such as are raised in India, were built across these waddies, perhaps few parts of the world would excel this in fertility, for wherever the slightest moisture can lodge, the surface is seen throwing forth vegetation. To create a soil by pulverising the rock, and to secure a plentiful supply and equal distribution of water by means of embankments, would be works of no great difficulty or expense; and it occurred to us, that if the pasha of Egypt had visited Sinai, the notion of adding this new territory to his dominions would have very readily suggested itself.

The waddies are covered with a profusion of bitter and aromatic herbs, which afford nourishment to the camel, and which at times exhale a pleasing perfume; and these, together with the wiry-leaved tamarisk or bastard-cypress, and an occasional palm-tree, give a touch of Oriental character to the scenery, without detracting from the accuracy of the poetical description of the sacred narrative—'a waste howling wilderness.' Perhaps of all the waddies on the way to Sinai, none impresses the traveller more than that called *Waddy Habroon*, or the Valley of the Hebrews; though why it should have received this name, rather than any other of the ravines through which the Hebrews must have passed, it is not easy to conjecture. We halted here, and took breakfast under a little projection of the rock which bounds one of its sides. But for a streamlet which trickled its feeble way through gravel and rushes, wild cypresses, and a meagre sprinkling of date palms, and which raised some of the sweeter home-feelings, this ravine would have outrivalled all the others for sublimity and solemn grandeur. The Scriptural expression—'a waste howling wilderness'—characterises, as exactly as language can, the style of the scenery of these waddies all along the route to Sinai; but one must have been there—one must have seen the ragged, shattered, and splintery pinnacles of bare red rock frowning above, and literally *listened* to the unbroken silence of the waste below, before one can understand the full force of the description. Never before had I experienced to such a degree that fulness and almost sickness of emotion which, in the common phrase of authors, defies the power of language to express it. Not only did language appear too feeble; the very habit of speech seemed, for the time, an imperfection which belonged only to a low condition of being. In his more glorious moments, a poet might rise to a level with the spirit of the mountain scenery of Europe; but here the highest powers of description would have been unavailing.

In the haunts of men, morning, mid-day, and evening are distinguished by their appropriate incidents; but in the desert, the progress of time is measured only by the great horologe of nature. There are three distinct aspects of earth and sky in the wilderness. At one time the traveller gazes with delight upon the mountain tops as they begin to be pencilled out by the rays, and to separate themselves from the heavy masses beneath; he inhales delicious refreshment from the cool bland winds, fragrant with scent from the scattered shrublets; and hies him onwards, as if motion were enjoyment. This is morning. But soon mid-day approaches, and the traveller begins to droop under the glare of the angry sun, which looks down upon him like a great bloodshot eye. Hemmed in between the piles which rise on both sides, and, as it were, sternly prescribe his path, he sinks under an aching sensation of fatigue; his eye drinks in molten fire from the burning sands, and finds no relief in turning to the rocky boundary; he is fain to seek rest on every spot of scanty herbage, and his soul and body are occupied in one single feeling, an intense longing for the evening. At last it comes; and who shall describe the night of the desert, whether with the light of the moon or with that of the stars? O how beautiful is moonlight here! Streaming down in a silvery flood, it bathes the barrenness around in soft and gentle radiance. Night in every land is the season for the heart to speak; but nowhere so peculiarly so as here, where man roams a houseless wanderer under the open canopy of heaven, with the silent stars looking meekly down upon him. An eastern night is truly glorious; and I am strongly of opinion that the pictures of this part of the world which I have seen, have all been taken under the influence of its mellowing witchery.

Anxious to press on, we did not halt till late in the afternoon, when our path, which had for several hours been ascending, brought us to a petty nook, where we resolved to remain during the night. Although we should have scarcely thought of dignifying the little declivity with the name of a ravine, we found that it boasted of the designation of *Waddy Sambra*; indeed every bend and alley of this thinly-peopled country is known by a distinct name to its wandering inhabitants.

May 6th.—We arose with alacrity, and felt braced for our journey, as well by the cold, which had increased very perceptibly since our leaving the coast, as by our anticipations of a sight of Sinai. Quitting an extensive valley which lay at right angles to *Waddy Sambra*, we entered, after some hours' travelling, a mountain-pass of dark-brown rock, differing from such as we have already seen in this, that the water-channel which ran through it, instead of occupying the entire breadth of the pass, was not more than twelve feet broad, while the breadth of the pass between the ranges was at least three hundred yards. Aware that, after we had entered this pass, Sinai could not be far distant, I dismounted, with the view of hastening forward at a more rapid pace than that at which the broken nature of the ground permitted the dromedary to advance. Full of excitement, and prepared by the descriptions of certain travellers to expect a sight of the most unusual and impressive kind, I had reached a slight elevation on the borders of an oval-shaped plain of considerable extent, when one of the Arabs exclaimed, '*Gibbel Moosa*' (Mountain of Moses)—the name given to Sinai. Our disappointment was extreme. We looked in vain for some awful, isolated mountain, such as we had supposed Sinai to be. All that we saw was the fore-mentioned oval-shaped plain, bounded on the right and left by a chain of vast mounds of stone, or rounded hills, quite different in character from the other broken ranges. Opposite to us, separated from the plain by a shallow water-course, which wound half round its base, and disjoined from the range on both sides—more, however, on the right than on the left—was a mountain, seemingly about three hundred feet high. This was the mountain the sight of which had drawn forth the exclamation of the Arab—St Catharine's, with its famous convent,* behind which, and concealed from us as yet, lay Sinai proper. The convent, as seen from where we stood, presented an appearance the very reverse of imposing; indeed the whole scene was disappointing to our excited imaginations. Was *this* the plain through which the Israelites had passed when about to receive the law? Was *that* the mountain where, for forty days and forty nights, Moses had remained hid from the people, amid incessant thunders and lightnings, and a constant smoke ascending from it, like the smoke of a furnace, and the mysterious intermitting blasts of a trumpet, exceeding loud? Such, in spite of ourselves, were our reflections; and we all agreed, both then and afterwards, that we had seen mountains far more sublime. We forgot, in the imme-

* The convent of St Catharine's, at Sinai, was founded, according to tradition, by Helena, mother of the Emperor Constantine, in the fourth century.

liate feeling of disappointment, that the Scriptural narrative nowhere warrants the expectations which we had entertained, of seeing in Sinai a mountain different from others in its conformation; and that the tremendous transactions which occurred on it, stood in no need of the scenic effect which our hasty imaginations were demanding.

Crossing the plain, and approaching the monastery, we could better observe the massive masonry of its walls. The monastery gardens, with their irregular and unsubstantial enclosures, lying between St Catharine's and the plain, had no doubt detracted from the appearance of the edifice, as seen from a distance. Admiring the industry of those who, without the assistance of any of the appliances of science, had rescued from the barrenness of nature the patches of cultivation which I saw, and deeply impressed at the same time by the thought, how deep and strong must have been the feeling which could have led men to renounce the world, and come to dwell in such a dreary and forbidding solitude, I arrived at the monastery of St Catharine's.

The worthy fathers had descried us at a distance with the aid of their telescopes, and were quite prepared, not to open their gates for us—for that is not the way in which visitors are admitted into the monastery of Mount Sinai—but to hoist us up by a windlass, into what may be described as an overhanging window, or a balcony without a floor to it. A rope as thick as a man's arm is lowered, the loop at the end of which being placed under the person to be raised, in the manner of a swinging-rope, he gives a signal to those above, who hoist him up accordingly. In this manner we soon effected our entrance into the monastery, servants, baggage, and all. One cannot help thinking, that if this device is intended to secure the place against Arab aggression, it is somewhat insufficient; besides that the mere name of the pasha is an ample protection. If, however, the design of the romantic mode of entry be to create an impression on visitors, one can pardon the harmless trick for its success. There was, in fact, something pleasing in being hoisted up some thirty or forty feet of dead wall, and swung into a curious-shaped apartment, among a number of good-humoured-looking fellows, with long beards, and robes of camels' hair, who, both the workers at the windlass and the lookers on, gazed at you with the most unsophisticated curiosity.

When all had ascended, we were conducted to the part of the convent appropriated to visitors, where we were accommodated with a suite of apartments both for ourselves and our servants. The room which we selected had an abundance of cushions and Syrian carpets, necessary to form that indispensable convenience in the East—a divan. We stood, however, in greater need of food than of rest, and the kind-hearted superior accordingly ordered bread and dates to be set before us. The former was a great luxury, after the acid composition which for some days we had been eating under the name of bread; and the dates were an excellent substitute for butter—an article which the abstemious monks never use. Simple as the fare was, we made a hearty meal, and the crystal water of Sinai tasted as if expressly designed to allay the thirst caused by the saccharine matter of the dates. It may here be proper to inform all who are interested, that the life of any animal is not permitted to be taken within the walls of the monastery; the good fathers, however, are accommodating in their spirit, and your servants may slay a whole flock of goats outside if they choose, and the carcases will be handed in for your use. As the goats of Sinai are reared on aromatic herbs and grasses, their flesh surpasses the finest venison in flavour. Sheep and cows are not procurable in this part of Arabia. The monks themselves live for the most part on fish and vegetables. Having fortunately been informed, before setting out from Tor, of their *penchant* for the former article of diet, we had brought six baskets-full as a present for them. Not having been salted or prepared for the journey, they had certainly not been improved by their carriage through the wilderness; our dragoman, however, informed us that a slight, or even a considerable degree of taint, would not prevent them from being greatly relished by the fathers. It was a severe fast with them at the period of our arrival; and it was provoking to think that two days more must elapse before our fish could be tasted. It is expected at the monastery that you pay for whatever you require, with the exception of bread and water, which are regarded as free to all comers. In the English spirit, we first insisted upon defraying all our possible expenses, after which we exhibited our present of fish. The discipline of the monastery is very rigid; and at whatever hour of the night you may awake, the same incessant heart-breaking chant assails your ear.

And now let us take a view of the interior of the monastery. From the veranda or balcony of our quarters, we were bewildered by seeing, piled up along the inside of the heavy walls of the quadrangle, an endless series of little lodges, almost like children's card-houses. As we looked at this jumble of little cells, we could hardly help thinking, notwithstanding the incongruity of such an idea with the locality, how admirably the borders of the quadrangle were suited for a game of 'hide and seek.' Becoming at length familiar with the appearance of these little tenements, we turned our eyes to the more important buildings which occupy the centre of the enclosure—the church of Justinian, or *Oostinianoos*, as the monks call him, and the mosque, which, to gratify the Mahometans, is, singularly enough, allowed to exist within the monastery walls. Continuing the glance till the eye rested on the bare and verdureless masses of dusky shattered rock which surround the convent like a rampart, the effect was peculiar. The walls of the monastery, by hiding the more adjacent ground from the view, produced the impression that you were in the bottom of a crater, of which the mountains round you were the sides. Few situations could have been selected better suited for the purposes of self-mortification; and the prolonged endurance of such a place must be inexpressibly painful. The fathers consider residence in this convent a hard service, and are glad to exchange it for that of Cairo when they can. All things considered, however, they are a wonderfully cheerful set of men; and they seemed anxious to do all they could to amuse us. We were happy in finding in their number a venerable individual who had been a merchant in Bengal, and had visited many parts of India, but had at length, for some cause or other, retired from the world, and come to end his days at Mount Sinai. This person attached himself to us during our stay, and was of essential service in pointing out and explaining much that was curious about the monastery. Although he professed to have abjured all interest in the world which he had forsaken, and even to be careless as to the fate of the relations he had left in Hindostan, I did not fail to perceive, that to speak a language which his tongue had long disused, but which was still familiar to his heart, gave him pleasure; indeed, all the while I continued addressing him in that language, which had perhaps in bygone days uttered his tenderest emotions, his eye seemed to say, no less plainly than the voices of the Hindoo shopkeepers I afterwards met with in Mocha, 'O speak to us once again in that dear Hindoostanee, for we do love to hear it!'

On the day after our arrival, we were taken to inspect whatever was considered worth attention in the monastery. We passed through the church built by Justinian. The exterior impressed us with the idea of great antiquity, but possessed no title to the praise of architectural beauty, resembling a vast powder-magazine rather than a church. The interior has also a very ancient appearance, but little more can be said for it, and the traveller who seeks gratification in the sight of beautiful paintings or superb furniture, would be disappointed here. There are, it is true, silver candlesticks at least seven feet high, but their size and their

value are their greatest recommendations, the workmanship being rude enough. The paintings on the roof and walls are the veriest daubs that ever issued from a brush. The mosaic of the church is simple, and, although in excellent preservation, appears to be coeval with its foundation. After surveying the church itself, we were conducted into a spacious recess at its farther extremity, where, besides the marble chest or sarcophagus in which the uncorrupted body of St Catharine is said to repose, we were shown the exact spot where Moses beheld the Burning Bush. Here, in the spirit, or rather according to the letter, of the sacred narrative, we were required to take off our shoes before we made our approach. Nor was the penance in the slightest degree inconvenient, for the passage was covered with rich Syrian carpet. A lamp is kept constantly burning within the shrine, casting a dim religious light through the gloom of the holy recess. The outer coating of the shrine consists entirely of splendid silver plates, a minute description of which would occupy several pages. Standing looking at them, I could not refrain from reflecting on the grossness, albeit the naturalness, of that taste which, instead of leaving a spot so sacred in our associations in its primeval state, a patch of ground on a barren hill-side, with the free winds of heaven blowing over it, could think of walling it in, and roofing it over, and covering it with Syrian carpet, and besilvering and beslubbering it with such in-door attentions.

Before leaving the church of Justinian, I inspected the splendid curtain of tapestry said to have been worked by the fingers of St Catharine herself, and which certainly, if she worked the whole of it, does credit to her patience, as well as to the forbearance of time. It is a rich web of crimson silk, about twenty feet long and ten broad, wrought with a skill which few ladies of the present age could emulate. The figures are embroidered of silk, plentifully intermixed with the richest gold twist, and represent scenes from the Scripture history—palm-covered landscapes, men and women in Oriental costume, and flocks and herds, among which the camel is always a conspicuous object. Altogether, the curtain, if not one of the most tasteful things in the world, is certainly one of the most rare and costly: it would sell, I should think, for ten thousand pounds in any capital of Europe.

Outside the church of Justinian were shown to us, growing in a small bed of earth, three or four reputed lineal descendants of the Burning Bush, in no very thriving condition. It struck me that the plant thus selected by the monks (not the present race, who evidently believe the tradition, but those of some former generation) to represent the Burning Bush had not been judiciously chosen. It is a rare plant in the district, and resembles the raspberry in its leaf, so much so indeed, that I could not help inquiring if it produced fruit. The plant which would have agreed better with my fancy on the subject was a small scroggy one, bearing a pretty but diminutive pink flower, and whose branches are so thick and close, that, if carefully cultivated, it could be shaped into seats by the pruning shears. So hardy is this little inhabitant of the desert, that it grows plentifully even on Mount Sinai, which also exhibits patches of various kinds of aromatic herbage, including a species of thyme with larger leaves than that of England.

Having made the tour of the interior of the monastery, we were prepared to ascend Mount Sinai proper. We were first ushered out of the monastery into the garden, through a low subterraneous passage defended by two massive iron gates, either of which was capable of resisting anything but artillery. The venerable superior himself opened these gates, and led us into the gardens—a sort of terrace about fifteen feet above the level of the ground outside, and containing abundance of fruit-trees, especially plums and almonds. Rosemary and similar herbs grow in perfection here; vegetables were not in season, but we were told they are produced in great plenty.

From a door in the wall of the garden we were required to let ourselves down, by taking hold of a rope, and walking down the wall backwards—a task of no great difficulty, owing to the roughness of the masonry. We were now fairly beyond the precincts of the monastery, and the ascent began. It was greatly facilitated by a sort of rough stair of large stones, for which pilgrims are said to be indebted to the piety of the Empress Helena. For my part, however, I saw no difficulty in the ascent of Mount Sinai sufficient to prevent any youthful lady, with a loving heart, and a stalwart arm to lean upon, from accomplishing it. An hour's walk brought us to a small flat or landing-place, where we refreshed ourselves at a well of excellent water. From this a winding path brought us to a second landing-place, where, besides plenty of water, there was soil enough to form a garden, had the monks so chosen. The only thing, however, which we found growing here was a large and beautiful cypress-tree. On this part of the mountain is an ancient chapel, of no great size, and of as simple architecture as the church of Justinian. This chapel, our guides informed us, was erected over the burial-place of the prophet Elisha; but as we have no account of Elisha's having ever visited Sinai, and as we are told in the thirteenth chapter of the first book of Kings that he was buried in Palestine, this must have been a mistake. Possibly the purpose of the chapel may have been to commemorate the scene in the life of Elisha's predecessor, Elijah, recorded in the nineteenth chapter of the first book of Kings; although the absence of all appearance of a cave near the spot would seem to indicate that, even under this supposition, the founder had fixed on the wrong locality. Continuing our ascent from the neighbourhood of this chapel, we came to another flight of steps resembling the former, but in better state of preservation. Ascending these, we were told that we stood on the top of Mount Sinai.

Mount Sinai proper, as has been already mentioned, is not visible on the road from Tor, being concealed by the intervening mountain of St Catharine's. There is a striking difference between the colour of the rock composing Mount Sinai and that of the rock composing St Catharine's—a circumstance which is rendered all the more noticeable by the close juxtaposition of the two mountains; so close, indeed, as only to be expressed by the word *contact*. The stone of St Catharine's is the same porphyry-coloured granite which appears to compose almost all the ranges of the desert; the stone of Sinai, on the other hand, whatever be its composition, is of a dirty white and gray colour, with a thin black or brown scurf, produced by the action of the weather. In this appearance our imaginations tried to find evidence of the great elemental warfare recorded in the sacred books; but unless in the whiteness of the summit, which might be supposed to have been the effect of the bleaching action of fire on porphyry-coloured granite, we could not find traces so palpable as we desired. Sinai rises like a vast tower from the plain, and is a more roundly-shaped eminence than is common in this region. Creeping close to the brink of the precipice, on the side opposite to that by which we had ascended, I gazed downward, not without feelings of dread, as the wind swept over me in sufficient force to carry me away. On this side, the mountain is not devoid of sublimity, which, however, is not increased by the small chapel erected on the spot. The plain at the foot of Mount Sinai is of greater extent than the oval-shaped one mentioned as stretching out before St Catharine's; and, contrary to the assertions of some, is, with the small hills which bound it (even without having recourse to the opinion, that geological changes have been brought about in this locality by convulsions which have happened subsequently to the period referred to by the sacred historian), quite large enough to have afforded encamping room to the Israelites while the law was being delivered. However, we are not bound to consider this mountain the true Sinai, although there seems to be little room for doubting that it is. There is one mountain in the vicinity of Tor,

with an immense plain at its base, which some are disposed to think is more entitled to the honour.

The Gulf of Suez is said to be visible from the top of Mount Sinai, but the weather was too hazy to permit our seeing it. We enjoyed, however, at one view all that sublimity of desert scenery which we had seen only in detached portions during our route. A vast extent of rocky wilderness lay before us, the shattered and verdureless pinnacles in which seemed like the upsputterings and spray dashes of a sea of adamant, rolling its reluctant billows under the hands of the Creator.

After luxuriating for some time in the prospect, we prepared to descend the mountain by a different route. In the descent, the worthy father who acted as our guide pointed out to us the spot where Moses broke in pieces the two tables of stone, and also the place where his hands were supported by Aaron and Hur while he prayed for the discomfiture of Amalek. Reaching the base of Sinai, we pursued a path leading round that of St Catharine's; and here we saw well-cultivated olive-gardens, belonging to the convent; also a huge stone, which we were informed was the very rock out of which Moses had brought water. It is a weather-rounded mass, of about ten feet high and six broad, which appears to have been detached from the mountain-cliffs above. According to the Scriptural narrative, Moses smote the rock only twice; but here we saw *twelve* goodly gashes. The propriety, however, of a separate outlet for the water of each tribe, will be apparent to every one.

From Moses' Rock we were led to the place where the Israelites worshipped the golden calf—the spot being marked by a hole dug into the rock immediately in front of St Catharine's, partly filled with rubbish, in token of abhorrence for the idolatry of which it had been the scene. Close to this locality we saw an encampment of Arabs, miserably poor in their appearance, but with large herds of goats—the Arab's wealth—browsing near them. It is quite a puzzle to conceive how these men can live under their slight tents of black goats' hair during the snows of winter.

Our walk ended, we re-entered the monastery by the same route as we had used for our exit. A few curiosities still remained to be seen. In the library, the superior showed us a manuscript Greek New Testament, said to have been written by a young lady in the fifth century; and a surpassingly beautiful specimen of caligraphy it was. We were shown also a paper purporting to be a copy of the firman granted by Mahomet to the monastery, the original, on which the prophet, who could not write, had stamped the impression of his hand, covered with ink, by way of signature, having been taken away by one of the sultans, who deemed it too precious to be left with the monks. The paper which we saw bore the delineation of the back of a hand, and appeared to be a copy of a copy, made expressly to bear handling.

And now came the time when we must quit this wonderful place. We parted with friendly regret from our kind-hearted entertainers, to whom we kept waving kisses with our hands while we remained in sight. Under the monastery walls we found a vast *posse* of Arabs, who offered us rock crystals, and rods resembling hazel, for sale. Disentangling ourselves from these people, we recommenced our journey through the scenes of grandeur which we had formerly passed. We had an opportunity, before leaving the neighbourhood of the monastery, of observing the exceeding hardness of the granite of which the desert ridges are composed. Some Greeks and Arabs in the service of the monastery were at work, shaping blocks of it into building stones; we examined their tools, and found them much blunted by the operation. I may mention here, that within the monastery are forges, anvils, and almost every implement necessary to assist human labour in a rude state of the arts. From the date the monks manufacture a spirit which, when tinctured with the juice of the southernwood, which grows profusely in the desert, is called *aqua ardente*—a name, however, which it scarcely deserves. The southernwood and other aromatic herbs of the desert possess the property of being igniteable in a green state—an unspeakable advantage to the traveller, as otherwise the refreshing coffee would be unattainable.

Much has been written respecting the dangerous character of the Arabs of the peninsula of Sinai. So far as my experience goes, I am bound to say that, in all my intercourse with them, I met with the most genuine politeness—that politeness which Lord Chesterfield defines as 'a desire to please.' The Greek inhabitants of the peninsula likewise, both lay and clerical, merit equal praise. The clergy are simple and dignified in their deportment; they possess in a high degree the affections of their flocks; and their morals appear to be unimpeachable. The monks of Sinai have been accused of covetousness; of this, however, I saw no evidence. Though not rich, they are not servile or cringing. The free-will offerings which flow to the monastery from Europe, together with a small revenue arising from the sale of their dates, and of the spirit which they manufacture from them, support them with decency, and enable them to show much kindness to their poorer brethren, and to the Arab population.

CHOOSING A WIFE.

'When I wed,' said young May to a friend with whom he was one day in conversation, 'it shall be with a woman who is pretty; I could not love any other. She must also be accomplished; I should not otherwise feel happy in society with her. She must be good tempered, or we might be eternally squabbling. She must be young, or her attractions would soon fade.'

'When I wed,' replied his friend, 'it shall be with a woman who is wealthy; I shall then be sure of being comfortable for life.'

In the course of time both May and his friend, whom we will call Matthews, went in search of a wife. They were both of respectable connexions, comely young men, and possessed fair opportunities of making a selection. May first entered upon his matrimonial expedition, resolving that he would adhere implicitly to the combination of qualifications which he believed could alone secure his happiness. Many months passed away, and among none of his acquaintances could he select a lady whom he conceived either sufficiently pretty, or accomplished, or good tempered, or young: they were all tolerable; but did not attain the necessary standard in either of the requisite qualifications. His was a persevering temperament, or he might have despaired. At length he was fortunate enough to meet a young lady, then in the zenith of her beauty, with blue eyes, auburn hair, and a complexion of alabaster and vermilion in their most approved proportions. May was smitten. Had his heart been less under the control of his head, he would have fallen straightway 'in love;' but he recollected that beauty was only one of the necessary ingredients of his matrimonial compound, and he paused. Here, however, was one requisite to begin with—something on which he might base his hopes—upon which he might have an assurance to proceed in search of the remaining qualifications. He procured an introduction to the family of the young lady, and was soon on intimate terms. Everything advanced prosperously. The lady was accomplished in the most extended signification of the term. She was evidently young, although—ladies will be so close—he had not been able to learn her precise age; and he had watched narrowly, but had never succeeded in discovering that she possessed any infirmity of temper. He paid her a visit one morning, for the purpose of presenting her with tickets for an approaching concert, and, being ushered suddenly into her presence, discovered her in the act of pulling her younger sister's ears, the latter not having properly learned a French lesson to which she had

been set. This was improper, but should scarce have been an unpardonable offence. May was, however, so surprised and shocked at the occurrence, that he curtailed his visit to the shortest dimensions commensurate with good-breeding (taking care to make no reference to the tickets he had brought), and never returned to the house. He was undoubtedly a fastidious young gentleman.

Beautiful as the morning, and gentle as the dove, was the next damsel who passed under his review. A winning kindness lurked beneath the glances of her dark hazel eye, and the tones of her voice resembled softest music. She was indeed the impersonation of goodness and meekness. May was enchanted with her appearance; but with his enchantment was mingled the cold calculation which had influenced him, probably for good, in the preceding case. He thought he could be happy with this fair creature, were she but accomplished. Unfortunately she was not: her circumstances and condition in life were such as had led rather to the cultivation of the amiable, than of the more brilliant qualities of a female education. There was stability of character, mingled with infinite taste, but an absence of extrinsic adornment. May was too much wedded to his standard to be content with this, and he thus lost a 'pearl of precious price.' Some time elapsed ere he was enabled to make a third essay towards obtaining a wife possessed of beauty, accomplishments, good temper, and youth. He had found youth, beauty, and accomplishments, and next, good temper and beauty, but with these he had not been content. He now met youth, good temper, and accomplishments, but was as little so. The young person who now attracted his attention had just passed over that period of life which has been so aptly compared to the earliest of the seasons. Her mind partook of the elasticity of her gait, yet had it acquired a certain degree of maturity, which told of her approach to womanhood. She was the breathing representation of the point of transition from the freshness and verdure of spring, to the brilliancy and the brightness of summer. She was, however, deficient in personal beauty, nay, particularly 'plain,' as the phrase is; and as May had resolved that he could 'love no woman who was not beautiful,' why, he passed her by also. Those persons who were aware of the objects of his search predicted an utter failure—not so much on account of the rarity of the stated combinations, as of the fastidiousness of the party who was to judge of their extent. It was, however, May's good fortune to be at length enabled to test the propriety of his standard. After many researches, and many disappointments, he met a lady at once young, accomplished, beautiful, and good tempered. What a day of joy was that to our fastidious friend! how numerous the congratulations he bestowed upon his zeal, his patience, and his perseverance! He would certainly have become insane from an ecstasy of delight, had he possessed an excitable temperament; but he did not, as has been already perceived.

May experienced no difficulty in placing his suit in desirable progress; and when it appeared to him that he had submitted to all reasonable delay, he 'proposed,' and was—rejected!

The lady entertained, and perhaps more justifiably, ideas not less exalted than his own relative to the party whom she should select as her partner for life, and it had occurred to her that May by no means coincided with those ideas.

Such a consummation of all his hopes, of all his perseverance, had not been expected, and it inflicted a fearful blow upon his pride. He endeavoured to reason himself into the belief that he had been grossly ill-used; but he could not conceal from himself that a freedom of selection was not his right alone. The result of his reflections was, that if he hoped to obtain a wife at all, he must in future abandon one or more of the qualifications which he had regarded as so absolutely necessary. He determined on abandoning accomplishments. These could be acquired in after-life, when yo beauty could not; and to create good temper had not originally existed, was very problemati

Having come to this determination, he had verse much of his old course again, but with advantage of new faces and new acquaintances. he had been loitering on his way, now rejecti beauty, now that, time had travelled onwar those whom he once knew as 'disengaged,' eit become the partners of less fastidious persons, regarded him with different eyes. A manly of person had in him given place to extraordin pulence, and suavity of demeanour to some composity and irritability. The good things life had enlarged his bulk, self-esteem had give agreeable turn to his conversation, and mortif and disappointments in the progress of his matr plans had rendered his temper uneven. He wa fore no equal competitor with younger and b spirited persons in the new field on which he wa ing, and it was not to be wondered at that he w quished in many set encounters. After very teristic perseverance, it became again evident that he must lower his standard for a wife anot

A love of the beautiful had rather predomin May's mind, and he now resolved that, if he enco beauty and good temper, he would be content would of course sometimes include youth; but i great modification of his original conceptions. however, for May's good fortune! Beauty had s admirers, that he seldom succeeded in securin tion to the offerings he presented at her shrine good temper playfully hinted that the gentlem had for so many years shown so much fastidi with regard to others, could not himself prove able acquisition.

Well, thought May—willing to make one mor ere he resigned himself to despair—beauty is bu sitory after all, and good temper a lottery—I content with youth. It is so delightful to wa expanding of the young mind, and to mould the ter of one's wife to the perfection of our standar wife shall certainly be young. But alas for the of our expectations! May had forgotten that now old, and that it is not every one's good for meet with a young woman who would 'rathe old man's darling than a young man's slave.' posed to youth, and he was rejected. From th ment he abandoned what appeared to him a h task, and passed the remainder of his days ' bachelor.'

Matthews, in the interim, had entered up search after wealth—unsatisfactory and humilia it is under most circumstances, but particul when made to influence considerations respectin riage. It was necessary for him to veil his int motives; and for a time he succeeded in doing s however, his attentions were ever in the direc which wealth was to be found, they were soon i to the right cause. This was unfortunate, as jected him to many rebuffs. Mothers would bi daughters be cautious of encouraging advan the part of Mr Matthews; and guardians woul cately hint that his views in certain quarters we sumptuous. Our hero was, however, clothed in brass,' and was not thus to be deterred. It was r able to observe how, in despite of all the defences surrounded his objects of pursuit, with what ing and intrepidity he would surmount them all, m cure an intimation of his 'ardent and devoted s be conveyed to its destination. Every similar corded in ancient or modern times is, upon comp cast immeasurably into the distance. Well, unl friend May, he was ultimately successful. Des the precautions which had been taken to prev approach, and in the teeth of all the dangers beset him, Matthews succeeded in obtaining th tions of a young lady of fortune, and married her

To do him justice, he was not wholly unprincipled. He had wedded for wealth, but was quite disposed to love, and to do all honour to his wife. The latter was high-spirited, confiding, and affectionate. Reared in the midst of luxury and profusion, she scarce knew the value of wealth, and had given little heed to the exhortations of her friends concerning Matthews's interested views. 'He has told me he loves me,' she would reply, 'and I believe him. He may be poor, but he is not mercenary.' Accustomed to the gaieties of a fashionable circle, Mrs Matthews contemplated rendering her house, after marriage, the agreeable resort of all the *ton* of the society in which her wealth entitled her to move. Being at the same time benevolent, she mentally arranged plans of extensive usefulness. On these two points it seemed probable that some unfortunate collision would occur between her husband and herself. Matthews had no enlarged views of benevolence; and his idea of society was limited to an occasional dinner, or a party at cards. At any rate, he was not disposed that that for which he had yielded his liberty, and fought so strenuously, should be what he considered 'foolishly squandered.' For some months, however, he felt a delicacy in stating his views to his wife, simply observing on one occasion, 'I fear, my dear, that we must begin to keep our expenditure within more circumscribed bounds.' 'Nonsense, Henry,' replied Mrs Matthews: 'of what value is wealth if it ceases to minister to the necessities of the unfortunate, or the gratification of social intercourse? If you love me, you will offer no opposition to my views in this matter.' Matthews was about to reply, but his wife placed her fingers playfully on his lips, enjoining silence, and the subject was discontinued. A few days after, he had another opportunity of adverting to the matter, of which he availed himself. His wife contemplated giving an entertainment on a more than usually splendid scale, and was desirous of consulting him relative to some of the arrangements.

'I suggested the other day, my dear,' he remarked, 'that we should place some limit to these entertainments.'

'I think I replied to you, Henry, that if you loved me, you would urge no objection?' she said pettishly.

'I know you did, my dear, but I cannot longer defer speaking plainly; we *must* retrench.'

'*Must*, Henry; did you say *must?*'

'Certainly, my dear; the money may be more advantageously disposed of than in giving these parties.'

'Is it not *mine*, Henry?'

Matthews reddened to the eyes; he had not anticipated so pointed a question. 'It *is* yours; but remember that the law gives me control over it,' he replied somewhat sharply.

Mrs Matthews coloured deeply in her turn; and then, a moment after, the blood fled from her countenance, and went back rushing to her heart, till it produced a feeling of suffocation. Her husband's language and sentiments were of a nature to which she had been totally unaccustomed: his declaration concerning the control which the law gave him over her property, brought back vividly to her mind the caution of her friends concerning his interested motives in proffering marriage. The whole was the occurrence of an instant. 'Henry,' she said, as the thought presented itself, 'it is not true what my friends reported of you previous to our marriage, is it?'

'What did they say of me?' he asked.

'They said you sought my fortune rather than myself.'

Here was a direction given to the discussion which Matthews did not expect, and the suddenness with which it had occurred completely discomposed him. His wife perceived his discomposure, and reiterated the question. He said abruptly, 'It is not true,' and quitted the room.

Here was a disavowal of the suspicion which had occurred to her, but the mode in which it had been given was not calculated to produce belief. If it were not well-founded, wherefore the agitation, the delay in giving a reply? Suspicion, once excited, overthrows every barrier of confidence, and Mrs Matthews felt convinced that her friends had spoken truth. Pride, self-esteem, vanity, love, all brought the tears gushing to her eyes, and she wept bitterly.

Matthews, after composing himself, returned to the apartment, to assure his wife of the falsity of her suspicions. She permitted him to believe that he had succeeded, but never again did Mrs Matthews repose that confidence in her husband's affection, and that reliance on his honour, which are among the surest safeguards of the happiness of wedded life. They appeared to the world a contented, if not happy couple; but Matthews ever felt, in despite of himself, that he was receiving the wages of a mercenary trickster; while his wife would sometimes wonder what it was which so weighed her spirits down, and rendered her wretched, until she reflected that she was wedded to an ADVENTURER.

OLIVER CROMWELL VINDICATED BY THOMAS CARLYLE.

SECOND ARTICLE.

ALTHOUGH Cromwell sat as representative of Huntingdon in the third and fourth parliaments of Charles I. (1627–9), he may be said to have lived to his thirty-seventh year in perfect obscurity. He devoted himself to farming business, had a large family of sons and daughters, and seems to have been altogether what is called a respectable member of society; albeit he himself, in the spirit of religious self-reproach, says he was the chief of sinners. On the rise of the troubles in Scotland, and the consequent calling of a parliament for supplies (1640), Cromwell came up for Cambridge. It was not, however, till he reappeared in the next parliament (1641), as representative of the same place, that he attracted any special attention. Sir Philip Warwick then describes him as 'a gentleman very ordinarily apparelled,' in 'a plain suit, which seemed to have been made by an ill country tailor.' His linen 'plain, and not very clean,' his 'sword stuck close to his side, his countenance swollen and reddish, his voice sharp and untuneable, and his eloquence full of fervour.' It is needless, however, to pursue these historical details; suffice it that, when it fairly came to war between the king and parliament, and the latter began to raise troops, Cromwell contributed L.300, and undertook the mustering of volunteers in Cambridgeshire. His first [illegible]s speak of [illegible]rgy: he seized the arms in the castle of Cambridge, and stopped the university plate, worth twenty thousand pounds, from being sent away.

The first actions in the war were, as is well known, in favour of the king. How Captain Cromwell saw the cause of the evil, and redressed it, may be gathered from a portion of a speech of his, which we give with Mr Carlyle's interpolations (those within inverted commas being for helping the sense—those in brackets exclamatory comments of the editor). 'I was a person who, from my first employment, was suddenly preferred and lifted up from lesser trusts to greater; from my first being a captain of a troop of horse; and did labour as well as I could to discharge my trust; and God blessed me "therein" as it pleased him. And I did truly and plainly, and in a way of foolish simplicity, as it was judged by very great and wise men, and good men too, desire to make my instruments help me in that work. And I will deal plainly with you: I had a very worthy friend then; and he was a very noble person, and I know his memory is very grateful to all—Mr John Hampden. [Hear, hear; a notable piece of history!] At

my first going out into this engagement, I saw our men were beaten at every hand. I did indeed; and desired him that he would make some additions to my Lord Essex's army of some new regiments; and I told him I would be serviceable to him in bringing such men in as I thought had a spirit that would do something in the work. This is very true that I tell you; God knows I lie not. "Your troops," said I, "are most of them old decayed serving-men, and tapsters, and such kind of fellows; and," said I, "their troops are gentlemen's sons, younger sons and persons of quality. do you think that the spirits of such base and mean fellows will ever be able to encounter gentlemen that have honour, and courage, and resolution in them?" Truly I did represent to him in this manner conscientiously; and truly I did tell him: "You must get men of a spirit: and take it not ill what I say—I know you will not—of a spirit that is likely to go on as far as gentlemen will go; or else you will be beaten still." I told him so; I did truly. He was a wise and worthy person; and he did think that I talked a good notion, but an impracticable one. [Very natural in Mr Hampden, if I recollect him well, your highness! With his close thin lips and very vigilant eyes; with his clear official understanding, lively sensibilities to "unspotted character," "safe courses," &c. &c. A very brave man; but formidably thick-quilted, and with pincer-lips, and eyes very vigilant. Alas, there is no possibility for poor Columbus at any of the public offices, till once he become an actuality, and say, "Here *is* the America I was telling you of!"] Truly I told him I could *do* somewhat in it. I did so—"did this somewhat:" and truly I must needs say this to you, "The result was"—impute it to what you please; I raised such men as had the fear of God before them, as made some conscience of what they did; [The Ironsides; yea!] and from that day forward, I must say to you, they were never beaten, and wherever they were engaged against the enemy, they beat continually. [Yea!] And truly this is matter of praise to God; and it hath some instruction in it, to own men who are religious and godly.'

Such was the practical manner in which Oliver Cromwell laid his claim to be esteemed as a man of genius. To create an adequate antagonist force, he went to work in right earnest, acting upon the idea that he had conceived. The counties had formed themselves into 'associations' for mutual defence against royalist oppression—a measure of course condemned as treasonable by the court party. The association to which Cromwell belonged, consisting of Norfolk, Suffolk, Essex, Cambridge, and Herts, and denominated the 'Eastern Association,' was the only one that kept together, and that exclusively through the operation of the plan suggested by himself to Hampden. It was not long before Cromwell attained to the rank of colonel; and in such capacity approved his activity to the utmost. He subjected the body of men under him to many changes; gradually dismissing the bad, and admitting the good, until he formed a troop of a thousand men, celebrated in history as 'the Ironsides.' Of Cromwell's troops the newspapers of the day state, 'Not a man swears but he pays his twelvepence.' Plundering, drinking, all disorder and impiety were disallowed. Such was the discipline imposed by the colonel—and to that discipline his successive triumphs in the war were owing.

It was not long ere Cromwell had made up his mind, stung by his country's wrongs, that regicide was lawful. In this at first he stood almost alone. Most men of that age were of Shakspeare's opinion—

> 'There's a divinity doth hedge a king,
> That treason can but leap to what it would!'

Cromwell had convinced himself of the contrary. We soon read of differences between the Earls of Essex and Manchester and him: they were evidently for less earnest measures than he was. He complained of the latter to parliament (it was soon after the sanguinary battles of Marston Moor and Newbury), when the Earl of Manchester recriminated upon him, stating, among other things, that Lieut.-General Cromwell had said that 'There never would be a good time in England till we had done with lords;' and also that 'If he met the king in battle, he would fire his pistol at the king as at another.' The upshot was, that the commons relieved the soldiery by 'the self-denying ordinance' of allegiance to 'the Covenant,' and a new modelling of the army was undertaken—a measure first of all ridiculed by the royal party, but proving ultimately fatal to them at Naseby, where Charles fought his last battle on the 14th June 1645. It was Cromwell himself who turned the fortune of the fight. We quote the latter half of his letter to the speaker of the commons on this occasion: 'Sir—this is none other than the hand of God; and to him alone belongs the glory, wherein none are to share with him. The general served you with all faithfulness and honour; and the best commendation I can give him is, that I daresay he attributes all to God, and would rather perish than assume to himself—which is an honest and a thriving way; and yet as much for bravery may be given to him in this action as to a man. Honest men served you faithfully in this action. Sir, they are trusty; I beseech you in the name of God not to discourage them. I wish this action may beget thankfulness and humility in all that are concerned in it. He that ventures his life for the liberty of his country, I wish he trust God for the liberty of his conscience, and you for the liberty he fights for.'

This letter, both in the sobriety of its style and the fervency of pious feeling, is stamped with sincerity. We find him, in a similar manner, after relating the particulars of 'the storm of Bristol,' declaring that 'he that runs may read, that this is none other than the work of God. He must be a very atheist that does not acknowledge it.'

Such then were the enthusiastic emotions with which Cromwell now regarded the contest—a fearful state of mind to be in if wrong; an earnest of success if right. Charles still, however, depended on the old *prestige*, that 'the king's name was a tower of strength,' and dreamed not that, through the example of one man, that same tower had been already undermined. But it was so. History has indeed hitherto described Cromwell as succeeding by means of 'hypocrisy,' 'master-strokes of duplicity,' 'false protestations,' and 'fomenting of the army-discontents.' This Mr Carlyle strictly denies; avouching, on the contrary, that it was 'by *continuances* of noble manful simplicity' that Cromwell penetrated and overcame all difficulties. The evidence certainly is in his favour.

The royalist power being put down by the civil war ending in 1645, a new war took shape and arose—that between the Presbyterian party, hitherto in power, and well affected to monarchy as a principle, and the sectaries or independents, the religious party *par excellence*, the party of Cromwell. The former was strong in the cities and in Scotland, the latter in the army. The progress of things continually threw new power upon Cromwell's side, for it was insuperably embarrassing to the Presbyterians to have to battle out their principles in connexion with the existing specimen of monarchy—a man utterly disaffected to presbytery. Cromwell's party, on the other hand, free from all such falsity of position, had no stay or hindrance to prevent their carrving out the realisation of the saintly government which all aimed at. The year 1648 was a year of Presbyterian efforts for the king, then a prisoner. It saw an army of twenty thousand Scots under the Duke of Hamilton, become 'stubble to the swords' of Cromwell's troops at Preston. And then came the ascendency of the army in parliament, and the execution of Charles.

of which there can be no doubt Cromwell was the main instrument. On this subject we have some highly characteristic paragraphs from our editor.

'"More savage than their own mastiffs!" shrieks Saumaise [a Dutch writer on the king's death]; shrieks all the world, in unmelodious soul-confusing diapason of distraction—happily at length grown very faint in our day. The truth is, no modern reader can conceive the then atrocity, ferocity, unspeakability of this fact. First, after long reading in the old dead pamphlets does one see the magnitude of it. To be equalled, nay, to be preferred, think some, in point of horror, to "the crucifixion of Christ." Alas, in these irreverent times of ours, if all the kings of Europe were to be cut in pieces at one swoop, and flung in heaps in St Margaret's churchyard on the same day, the emotion would, in strict arithmetical truth, be small in comparison! We know it not, this atrocity of the English regicides; shall never know it. I reckon it perhaps the most daring action any body of men to be met with in history ever, with clear consciousness, deliberately set themselves to do. Dread phantoms, glaring supernal on you—when once they are quelled, and their light snuffed out, none knows the terror of the phantom! The phantom is a poor paper lantern, with a candle-end in it, which any whipster dare now beard.

'A certain queen in some South Sea island, I have read in missionary books, had been converted to Christianity; did not any longer believe in the old gods. She assembled her people; said to them, "My faithful people, the gods do *not* dwell in that burning mountain in the centre of our isle. That is not God; no, that is a common burning mountain—mere culinary fire burning under peculiar circumstances. See, I will walk before you to that burning mountain, will empty my washbowl into it, cast my slipper over it, defy it to the uttermost, and stand the consequences!" She walked accordingly, this South Sea heroine, nerved to the sticking-place; her people following in pale horror and expectancy. She did her experiment; and I am told they have truer notions of the gods in that island ever since! Experiment which it is now very easy to *repeat*, and very needless. Honour to the brave who deliver us from phantom-dynasties, in South Sea islands and in North!

'This action of the English regicides did in effect strike a damp like death through the heart of flunkeyism universally in this world. Whereof flunkeyism, cant, cloth-worship, or whatever ugly name it have, has gone about incurably sick ever since; and is now at length, in these generations, very rapidly dying. The like of which action will not be needed for a thousand years again. Needed, alas! not till a new genuine hero-worship has arisen, has perfected itself, and had time to degenerate into a flunkeyism and cloth-worship again. Which I take to be a very long date indeed.'

Amidst the terrible doings of this very crisis, Cromwell was carrying on a negotiation for the marriage of his son Richard to a certain Dorothy Mayor, at Hursley; and he writes on this subject only two days from the date of the king's death!

One thing becomes very clear from this book—the self-consistency of the whole theory, so to speak, on which Cromwell proceeded, and the consistency of that theory, and the proceedings themselves. The supposition of hypocrisy is preposterous: no man ever kept up a deception so long, or so exactly, or with such results. But we feel at the same time the terrible nature of this theory, carrying the man through the life-blood of opposing thousands without a shadow of humane compunction. It took the spring and summer months of 1649 to wreck and suppress the last opposition to the Commonwealth in England; but in Ireland the new government had no footing save in Dublin and Derry. But nation was unanimous after an Irish fashion—that it was wholly against the English Commonwealth, but split into many mutually hostile parties. 'Catholics of the Pale demanding freedom of religion;' 'old Irish Catholics under Popes' Nuncios, unable to agree with the Catholics of the Pale;' 'Ormond Royalists, of the Episcopalian and mixed breeds, strong for king *without* covenant; Ulster and other Presbyterians, strong for king *and* covenant.' 'All these plunging and tumbling in huge discord for the last eight years, have made of Ireland and its affairs an unutterable blot.'

Oliver comes in with an army in the month of August, is well received in Dublin, where his party was in force, and immediately proceeds against the various independent armies opposed to him, which, through his own energy and their want of union, he in six months dissipates, leaving the country prostrate at his feet. We find at this crisis the most characteristic of all Cromwell's actions. The enemy had 4000 men under Sir Arthur Ashton in Tredah (now called Drogheda). What was their fate we shall see from Cromwell's own account of his storm of the town, in a letter to Speaker Lenthall.

Breaches having been made in the wall with cannon —'Upon Tuesday, the 10th of this instant, about five in the evening, we began the storm; and after some hot dispute, we entered about seven or eight hundred men, the enemy disputing it very stiffly with us. And indeed, through the advantages of the place, and the courage God was pleased to give the defenders, our men were forced to retreat quite out of the breach, not without some considerable loss; Colonel Cassel being there shot in the head, whereof he presently died; and divers officers and soldiers doing their duty killed and wounded. There was a tenalia to flanker the south wall of the town, between Duleek Gate and the corner tower; which our men entered, wherein they found some forty or fifty of the enemy, which they put to the sword. And this "tenalia" they held; but it being without the wall, and the sally-port through the wall into that tenalia being choked up with some of the enemy which were killed in it, it proved of no use for an entrance into the town that way.

'Although our men that stormed the breaches were forced to recoil, as is before expressed, yet, being encouraged to recover their loss, they made a second attempt; wherein God was pleased so to animate them that they got ground of the enemy, and, by the goodness of God, forced him to quit his intrenchments; and after a very hot dispute, the enemy having both horse and foot, and we only foot, within the wall, they gave ground, and our men became masters both of their intrenchments and "of" the church; which indeed, although they made our entrance the more difficult, yet they proved of excellent use to us; so that the enemy could not "now" annoy us with their horse, but thereby we had advantage to make good the ground, that so we might let in our own horse; which accordingly was done, though with much difficulty.

'Divers of the enemy retreated into the Mill-Mount, a place very strong and of difficult access; being exceedingly high, having a good graft, and strongly palisaded. The governor, Sir Arthur Ashton, and divers considerable officers being there, *our men getting up to them, were ordered by me to put them all to the sword; and indeed, being in the heat of action, I forbade them to spare any that were in arms in the town; and I think that night they put to the sword about* 2000 *men;* divers of the officers and soldiers being fled over the bridge into the other part of the town, where about one hundred of them possessed St Peter's church steeple, some the west gate, and others a strong round tower next the gate called St Sunday's. These being summoned to yield to mercy, refused; whereupon I ordered the steeple of St Peter's church to be fired, when one of them was heard to say in the midst of the flames, "God d—— me, God confound me; I burn, I burn."

'The next day the other two towers were summoned, in one of which was about six or seven score; but they refused to yield themselves; and we knowing that hunger must compel them, set only good guards to secure them from running away until their stomachs were

come down. From one of the said towers, notwithstanding their condition, they killed and wounded some of our men. When they submitted, their officers were knocked on the head, and every tenth man of the soldiers killed, and the rest shipped for the Barbadoes; the soldiers in the other tower were all spared as to their lives only, and shipped likewise for the Barbadoes.

'I am persuaded that this is a righteous judgment of God upon these barbarous wretches, who have imbrued their hands in so much innocent blood; and that it will tend to prevent the effusion of blood for the future. Which are the satisfactory grounds to such actions, which otherwise cannot but work remorse and regret.

'And now give me leave to say how it comes to pass that this work is wrought. It was set upon some of our hearts, that a great thing should be done, not by power or might, but by the spirit of God. And is it not so, clearly? That which caused your men to storm so courageously, it was the spirit of God, who gave your men courage, and took it away again; and gave the enemy courage, and took it away again; and gave your men courage again, and therewith this happy success. And therefore it is good that God alone have all the glory.'

The reader will perfectly understand this pitilessness in a fanatic, and see that the ascribing of the victory to God was only part of the tremendous theory which possessed him. But what will he make of the fact that an educated man of the present day, standing in no observable affinity to the religious party of Cromwell, justifies these and other like horrible barbarities, on the score that their perpetrator was a man under a solemn conviction of God's judgments on earth; not a believer in 'the rose-water plan of surgery;' one coming with acts of parliament made as near as puritan wit could make them 'to God's law-book;' calling upon the Irish to conform to these, under the threat that, on refusal, 'I will not let you continue living;' one whose word was not bluster, but followed by act: in short, for no reason in the world, when Mr Carlyle's verbal quidditics are interpreted, but because Cromwell had a religious doctrine in which he was sincere, and was stayed by no humane considerations in working it out; as if every man equally veracious were entitled to treat his fellow-creatures—his equals in the right of forming their opinions—exactly as he pleases? Will it readily be believed that an author of fame in our day is so utterly destitute of a right view of God's work and man's work on earth, as to write, with an appearance of seriousness, such wretched and unmitigated nonsense as this?

Through such stern measures, Cromwell reduced Ireland. His reduction of Scotland was accomplished in a less harsh manner, because the people of that country were more akin to him in their religious feelings. These transactions, however, as well as his whole career as head of the state, must be left unreviewed, as our space is for the present exhausted. We meanwhile recommend a perusal of Mr Carlyle's work. It has effectually, we believe, vindicated its hero from the charges of hypocrisy and mere ambition: the only tenable theory now is, that he was a Great Earnest Man, seeking primarily the realisation of a government according to Scripture, and only drawn into personal aggrandisement because that was unavoidable in his endeavours for the main end. But the merit and value of the *system* (as it may be called) of Cromwell is an entirely different consideration, and one which remains unaffected by the extraordinary defence which the system here meets. Fact, we conceive, has settled that question long ago. If the idea of a government, according to one small sect's interpretation of the divine will in Scripture, had been a good idea, it must have lived. But what is the fact? that, in eighteen months from the death of the strong man who had upheld it for four or five years under constant difficulties, it went down amidst the kicks and curses of universal human nature, not only never to rise again, but to be followed by one of the worst possible governments of another kind, which nevertheless men embraced with transports of joy, as if any kind of tyranny were felt as relief from one professing a basis and a justification in religion.

'THE CITY.'

It is a well-known part of the egotism of Londoners to speak of 'the city,' as if it were *par excellence* the only city in the world, and with the conviction that the locality indicated by the term will be known and recognised in the most remote regions of civilisation. This egotistic designation of an infinitesimal spot on the globe (and indeed of a small portion of the metropolis itself), is not altogether inexcusable; for although we question whether a merchant of the bazaar at Constantinople, or a trader in the Gostoni Dovor of Moscow, would fully understand that '*the* city' meant our city and not his, yet few foreigners connected with commerce would feel more than a moment's hesitation in fixing the meaning attached by Londoners to the expression. The space between the far-famed Temple Bar and the equally celebrated Aldgate Pump one way, and the river Thames and the 'bars' of Smithfield and Holborn the other, presents a scene of busy ceaseless commerce—a sea of traffic, the waves of which reach to the most distant shores.

In the dark alleys and dingy chambers which surround the Bank of England and the Royal Exchange, transactions are daily completed, the enormous value and amount of which it would be difficult, perhaps impossible, to compute. But the exterior aspect of 'the city'—the peculiarities of its merchants, with the more observable and important of their bewildering operations—are not so difficult to note; and an attempt has been recently made to detail them in a little work entitled 'The City, or the Physiology of London Business, with Sketches on 'Change and at the Coffee-houses.'*

Of all the complicated ramifications and motions of commerce, banking must be considered the mainspring; hence the author has judiciously commenced his book by some insight into the interior of the Bank of England. 'This bank is governed by a court of twenty-four directors, eight of whom go out of office every year, when eight others are elected. Half-yearly dividends are declared, and the proprietors now receive 7 per cent. per annum on the stock. It is the most absolute corporation in the country; for although the proprietors meet twice a-year to be informed of the state of their affairs, little or no information is gained beyond the amount of the *rest*.' This 'rest,' which we so often find mentioned in the newspapers, consists of what remains after the dividends are satisfied, and forms a fund for any unforeseen contingency which may arise during the coming half year. Upon this residuum the directors can 'come and go:' it consequently imparts freedom and elasticity to their operations. As they are by no means communicative as to their transactions, the increase or decrease of this reservation is almost the only clue the public have to the state of their affairs; hence the declaration of its amount is eagerly looked to by all persons largely interested in the money market.

A vast proportion of the money affairs of this empire are transacted in a modest room of the 'great house in Bartholomew-lane' (to borrow a favourite expression from a famous auctioneer), called the 'bank parlour.' This mysterious apartment is looked upon with a sort of awe, and no banker's clerk presumes to mention it but in terms of respect and veneration. 'It is rather meanly furnished with lengthy mahogany settles, covered with faded crimson merino; the walls are without the least decoration; and a bridge of tables, the deformities of which are hidden by green baize, alone separates the directors from the proprietors. A few scattered chairs is all the accommodation offered to the directors while the meetings are in progress; but these

* Baily Brothers: London, 1845.

are seldom or never filled, as they generally stand out the quarter of an hour or twenty minutes the proceeding lasts. The attendance of the directors under such circumstances would, without question, be considered a fatiguing process, did not the ear suddenly encounter the rattle of cups and saucers, and the eye discover a very spruce messenger, with white cravat and light pumps, gliding stealthily behind the screen from and to the room where the refreshment is served. The lobby to the bank parlour is the only place in the establishment which is at all indebted to art for attraction. Here we have a few of the old cashiers of the bank, painted with remarkably gray wigs, lay down collars, and stiff lace ruffles, including that singular character Mr Abraham Newland, who rose from a baker's counter to be chief clerk of the Bank of England. We suppose the directors have discontinued the plan of panelling the memory of departed officers, for we see none of those to whom common report assigns part of the management of later years.' Perhaps that part of the building which is of the most intrinsic importance, is on the basement, in which the cellars are for the storing of bullion. Of this they contained in October 1845, the value of L.14,865,000. Above ground the various offices afford accommodation for about 800 clerks, whose salaries range from L.50 to L.2000 per annum.

The less important banking transactions of 'the city' are carried on by private and joint-stock banks. The first are no more than firms of two or three individuals who trade in money, as other copartneries deal in less current merchandise, on their own account and responsibility; whilst the latter are conducted on principles first and successfully practised in Scotland, but which were not introduced into England till within the last fifteen or twenty years. They have a large staff of officers in the character of managers, sub-managers, and secretaries, beside their cashiers and clerks, as in ordinary banking-houses. Being modern establishments, their officers present widely opposite characteristics to those of the older private firms. Instead of being attended to in the latter by 'cashiers and clerks peering through spectacles with a steady and staid appearance, whose only inquiries are respecting the weather and the prospects of business, you find yourself, on entering a joint-stock bank, in the company of sprightly young gentlemen, who talk about new operas and the other amusements of the town with all the ease of connoisseurs in high life, and whose chief study is to give effect to chequered neckerchiefs, showy chains, and mogul pins. This, no doubt, is the march of improvement, but to the quiet man of business, the times in this respect are scarcely so acceptable as the old days of white ties, venerable faces, and tranquil attention to the wants of customers. The modern improvements do not facilitate the counting or weighing of sovereigns, crossing cheques, or balancing ledgers.' Our physiologist should, however, have added that, as a set off to the *dilettante* peculiarities of the new school, they are more quick and ready in their motions, and do not keep one so long waiting one's 'turn' at their counters as the spectacled gentlemen of the old school.

Although to discount bills of exchange is usually recognised as only part of a banker's business, there are several firms who make that their sole business, and are known as 'discount houses.' 'The bills these houses principally discount are those of merchants and country bankers; and the rates paid vary according to the general supply of money, and the terms upon which the Bank of England is disposed to make advances. Two and a quarter, and two and three-quarters per cent. is about the current quotation for unquestionable paper, and at these prices a great deal of business has been done in the plethoric state of capital during the last two or three years; but as much as five and six per cent., even on first-rate bills, has been paid when a scarcity has existed, and when the bank has continuously advanced its rates of accommodation. Bill-brokers advance money on all descriptions of securities, such as exchequer bills, consols, wine, sugar, or other produce warrants; but they usually take care to stand in a good position; that is to say, on the right side of the value of the security they hold.' To show the enormous sums advanced in this way, we are told that three of the most eminent concerns have each not less than five millions of money under discount in the course of the year.

The mysteries of the Stock Exchange are partially unravelled in the work before us. This building—in which fortunes are daily, hourly being won and lost—is hidden by the houses which form the east side of Bartholomew-lane and the northern bend of Throgmorton Street. It is entered by Capel Court, nearly opposite to the rotunda of the Bank of England; but entrance is rigidly denied to all save stock-brokers. Any banker, merchant, capitalist, trustee, or private individual, therefore, who may wish to buy or sell stock, must employ a member of the Stock Exchange (of whom there are about 800) to effect the transaction. The process is this:—The principal having given his orders to the broker, that individual wends his way into the exchange, inside of which another class of men are always to be found ready and eager to do business, who are called 'jobbers.' 'When a broker comes in as a buyer or seller, he is instantly surrounded by a number of jobbers, who announce their readiness to take or supply whatever amount of stock he has orders to deal in at a price varying the 1-8th (2s. 6d.) per cent. To explain: if a certain broker has business to transact in L.5000 consols, the jobber will offer to buy his L.5000 at the market price, say at 97, or to sell him the same amount at 97·1-8th, without being in the slightest degree aware whether the broker has orders to buy or sell; thus taking on himself the risk of selling that which he does not possess, or buying what he has no intention to keep, his only object being to *undo* his bargain at a difference of 1-8th per cent., and sometimes at only 1-16th, with another broker, who may have to effect an operation precisely the reverse of the other; which 1-8th or 1-16th per cent. constitutes the profit of the jobber.' By the ageney, therefore, of the jobbers, a market is always maintained, for they are ever ready to buy or sell. Most of them confine their transactions to one particular stock, though some deal in every sort of public security. Their profit is derived from the turn of the market, which is always in their favour. Thus, when stock is quoted in the newspapers at '35 to 1-8th,' it means, the public is given to understand, that if they wish to sell, only 35 per cent. will be obtained for their stock; but if they want to buy, 35 and 1-8th per cent. must be given. The lower price quoted is the selling, and the higher the buying price; the 1-8th being the jobbers' profit. The jobbers are, in reality, the 'middle men,' who stand in the house in the character of dealers, always, or almost always, ready to buy or sell, thus obviating the necessity of any broker seeking a second broker with whom to transact his particular business: or, in other words, whom it might suit to buy the stock which the first broker had to sell, or *vice versa*. Now, in this case, even if a second broker could be found, he might not be able to concur in the precise amount of stock in which the other had to operate; whereas the jobber is ready to do business to any amount, even to the smallest fraction, and hence prevents much time and labour from being fruitlessly consumed.

It is curious to reflect how the instinct of a humble, and *par excellence* innocent animal, has been brought to bear upon such a business as that of the Stock Exchange. According to our author, 'Till within the last seven or eight years, the ordinary courier brought the news from the continent; and it was only the Rothschilds, and one or two other important firms, that "ran" intelligence in anticipation of the regular French mail. However, about ten years ago, the project was conceived of establishing a communication between Paris and London by means of pigeons, and in the course of two years it was in complete operation. The training of the birds took con-

siderable time before they could be relied on; and the relays and organisation required to perfect the scheme not only involved a vast expenditure of time, but also of money. In the first place, to make the communication of use on both sides of the channel, it was necessary to get two distinct establishments for the flight of the pigeons—one in England and another in France. It was then necessary that persons, on whom reliance could be placed, should be stationed in the two capitals, to be in readiness to receive or despatch the birds that might bring or carry the intelligence, and make it available for the parties interested. Hence it became almost evident that one speculator, unless he was a very wealthy man, could not hope to support a "pigeon" express. The consequence was, that the project being mooted, two or three of the speculators, including brokers of the house, themselves joined and worked it for their own benefit. Through this medium several of the dealers have made large sums of money; but the trade is scarcely so profitable as it was, because the success of the first operators has induced others to follow the example of establishing this species of communication. The cost of keeping a "pigeon" express has been estimated at L.600 or L.700 a-year; but whether this amount is magnified with the view of deterring others from venturing into the speculation, is a question which never seems to have been properly explained. It is stated that the daily papers avail themselves of the news brought by these "expresses;" but, in consideration of allowing the speculators to read the despatches first, the proprietors, it is understood, bear but a *minimum* proportion of the expense. The birds generally used are of the Antwerp breed, strong in the wing and fully feathered. The months in which they are chiefly worked are the latter end of May, June, July, August, and the beginning of September; and though the news may not be always of importance, a communication is generally kept up daily between London and Paris in this manner. In 1837-38-39, and 1840, a great deal of money was made by the "pigeon-men," as the speculators supposed to have possession of such intelligence are familiarly termed; and their appearance in the market was always indicative of a rise or fall, according to the tendency of their operations. Having the first chance of buying or selling, they of course had the market for a while in their own hands; but as time progressed, and it was found that the papers by their "second editions" would communicate the news, the general brokers refused to do business till the papers reached the city. The pigeons bringing the news occasionally get shot on their passage; but as a flock of some eight or a dozen are started at a time, miscarriage is not of frequent occurrence. At the time of the death of Mr Rothschild, one was caught at Brighton, having been disabled by a gun-shot wound, and beneath the shoulder-feathers of the left wing was discovered a small note with the words "Il est mort," followed by a number of hieroglyphics. Each pigeon establishment has a method of communication entirely its own; and the conductors, if they fancy the key to it is in another person's power, immediately vary it. A case of this description occurred not long ago. The parties interested in the scheme fancied that, however soon they received intelligence, there were others in the market who were quite equal with them. In order to arrive at the real position of affairs, the chief proprietor consented, at the advice of a friend, to pay L.10 for the early perusal of a supposed rival's "pigeon express." The "express" came to hand, he read it, and was not a little surprised to find that he was in reality paying for the perusal of his own news! The truth soon came out—somebody had bribed the keeper of his pigeons, and were thus not only making a profit by the sale of his intelligence, but also on the speculations they in consequence conducted. The defect was soon remedied by changing the style of characters employed, and all went right as before.'

Quitting the Stock Exchange, we cross the end of what was once 'Bank Buildings,' and enter the place where merchants most do congregate—the Royal Exchange. The 'old massive building, with its firm oaken benches for the accommodation of those who were tired of pacing the ambulatories, and its walls extensively illustrated with placards of ships about to sail, of goods to be sold, and lists of the sworn brokers of London, we have now a large and sightly building, with walls flaring with colours, exhibiting in the encaustic process vases filled with fruits and flowers, gay, indeed, but not universally admired by men of business, or connoisseurs in architecture. The hours of 'Change—as regulations lately instituted enforce—are from half-past three to half-past four P.M., a period when the merchants and others connected with mercantile affairs meet together before the close of the business of the day. The different interests are severally divided, and hold, almost by prescriptive right, a particular spot where their members meet, and these are called the "walks;" such as, the "Mediterranean," the "German," the "Spanish," or "Portuguese" walks. Here parties discourse of the latest events; failures, if there be any; recent contracts for goods; last-quoted prices; and general business. The two great days on 'Change are Tuesday and Friday, and then the full force of the mercantile interest is in attendance, as the operations which regulate the foreign exchanges are on these occasions concluded.'

Although individuals may pass their days in the different public offices and places of resort, yet their object is the same—commerce. 'The bustle and activity of city life,' says our author, 'begins at nine and ten o'clock in the morning, and concludes between six and seven o'clock in the evening. Between the former hours the suburbs and the west have poured in their thousands of human beings, who are engaged in business from Monday morning till Saturday night, in one continued round, and who, in the latter hours, return to their homes to prepare for the morrow's occupation. Before and after those hours you see or hear scarcely anything in the shape of business. In the intermediate period the whole place is alive with the multitude engaged in the operations of the day, and the comers and the goers seem never likely to expend their force, and one would imagine that the great concourse could never disperse. Visit the city at twelve o'clock mid-day, and again at seven in the evening, you would wonder where the people had all gone to. Round 'Change you would not find a soul; in Bartholomew-lane, the only cry heard would be that of the 'bus-conductor for Paddington and Holloway; and in Lombard Street the police would watch you as though you contemplated a burglary at Glyn's or Barclay's, and perhaps inquire the cause of your loitering in the neighbourhood. At eight o'clock at night the "stillness of death" reigns over the city, and not till the morning, between that hour and nine, is there anything like the note of preparation sounded for business. The city is not now much chosen for a residence. The old houses in the best thoroughfares are either let as offices, or given up to the occupation of housekeepers who have the charge of the premises. At the banks, the rule is for the junior partner to reside on the premises; and a certain number of clerks also live in the house. Merchants and others, who formerly located in the suburbs, have in a great number of cases chosen west end domiciles. Regent's Park, and the rows of villas that stud the neighbourhood of Kensington, Brompton, Hammersmith, and other places tending to those points, are thickly inhabited by city men. Clapton, Hackney, Islington, Peckham, and Clapham, which at one time were considered very convenient distances by these people, have been denuded of a number of their former occupants. Clerks, instead of principals, now reside in these localities, all short rides or walks from the city being filled with the habitations of this class of persons.'

At night 'the city' is indeed silent, and it is only the west end of the town—where the fashionables re-

side, and the places of amusement are situated—that shows symptoms of life. The rich merchant has rolled home in his carriage, the clerk has had his sixpenny ride to Camberwell or to Paddington, the perambulating orange-seller has taken his basket to his garret for the night, the ticket-porter has rolled up his apron and retired to his court, and all is hushed in a silence that is only broken by the tread of a policeman or the barking of a dog which has lost his master. The busy hum of men is no longer heard. Business has retired to rest, and the feverish pulse of speculation has ceased to beat.

EFFECTS OF CULTURE ON VEGETATION.

THE effect produced by civilisation on the feelings and intellect of the savage, the modifications induced in the characters of the lower animals by domestication, are not more wonderful than the changes which have been effected on many vegetable families by the power of cultivation. Root, stem, leaf, flower, and fruit, are each naturally endowed with a certain degree of mutability, according to circumstances of soil, climate, and other external conditions; and man, practising upon this mutability, has, in course of time, succeeded in rearing products which bear scarcely any resemblance to their natural originals. There is a limit, no doubt, to this divergence from the normal type—a line beyond which organic adaptability cannot be forced, without interfering with the healthy existence of the organism; but of such a limit in vegetation we are yet almost absolutely ignorant. All that can be said in the present state of our knowledge is, that certain results have been obtained, some of which we intend to notice as being at once highly curious and important.

In a state of nature, most vegetable tribes are limited to definite localities, these situations being characterised by some peculiarity of soil and atmospheric influence. If the conditions of soil and climate remain the same, the character of plants is nearly uniform and stationary; and this may be always said of them in their natural state. But if they be removed from a poor to a rich soil, from a warm to a cold climate, from a dry to a moist habitat, or *vice versa*, then their internal structure will undergo a change, and this change will manifest itself in one or other of their external characters. In some classes, the change is most evident in the roots and tubers, in others in the stems and leaves; while in many the flowers and fruit are the parts most affected. Sometimes change of situation produces merely a more luxuriant development of all the parts of a plant, without causing any abnormal growth of a particular organ, as may be seen every season by comparing the crops on a poor gravelly soil with those on rich alluvium, or the produce of a neglected field with that of a well-manured garden. Culture, in the widest sense of the word, may therefore be considered as the cause of these irregular changes, which assume in plants a wonderful degree of permanency, and may be transmitted to successive races; though, generally speaking, if the artificial stimulus be not kept up, plants will return to their normal or natural condition.

The changes which *roots* and *tubers* can be made to undergo are numerous, and highly beneficial to man. The potato, for example, is a native of tropical America, and when found wild, its tubers are not larger than a chestnut, and scarcely edible; while in Europe it has been rendered, by artificial treatment, one of the most valuable articles of human food. The produce of an acre of wild potatoes could be held in a single measure; while in Britain the same area will yield from forty to sixty bolls. Cultivation has also produced innumerable varieties of this tuber, each varying in shape, size, colour, and quality; and this, it may be said, all within the last hundred years; for though the potato was imported from America three centuries ago, it is scarcely one since it met with anything like attention. Beet, parsnip, and turnip, have been also wonderfully modified by culture, and made to break off into numerous varieties. The bulb of the latter, for instance, has, since the beginning of the present century, been metamorphosed from globular to fusiform, in colours from white and yellow to purple and green, and in weight from a couple of ounces to more than twenty pounds. So also with the carrot, which in a wild state has a slender root of a yellowish-white colour, but which, under cultivation, swells out, and becomes succulent, assuming a deep red or orange colour. In the one case the root is not much thicker than a common quill; in the other it becomes as thick and long as a man's arm—the produce being sometimes so much as 400 bushels per acre. The cause of most of these changes is abundantly obvious. Cultivation removes a plant to a richer soil, where it can obtain all the elements essential to its growth with greater facility, and without suffering those impediments to continuous growth which alternate drenchings and droughts are so apt to occasion in a state of nature. If the soil be too wet, it undergoes drainage; if too dry, it is irrigated; besides being deepened and softened, to admit of the easy expansion of the bulb or tuber on every side. As in animals, so in plants, every individual has a tendency to reproduce its own qualities in its offspring, and man, taking advantage of this feature, rears only such species and hybrids as best suit his purpose, until, by successive developments, these qualities greatly exceed anything in nature, or even become altogether monstrous.

Stems, though less liable to metamorphoses of this kind, are still capable of being strangely changed from their normal condition. Every one is aware, that if a tree which is a native of mountains be planted in a valley, it grows more rapidly, but its timber becomes softer and less durable; and in like manner, if the tree of a valley be removed to a mountain, it becomes of slow growth and stunted form, but produces timber remarkable for its toughness and durability. By cultivating upon this principle, tall stems are for the most part rendered short or dwarfish, and shorter ones taller—the dahlia, for example, having been reduced to one half of its natural height by garden culture. The cabbage, in a wild state, has a tough, slender stem, which by culture has become fleshy and fusiform: there are no stalks and shoots to be found among the asparagus plants of the sea-shore which can compare with those of our gardens; and so also it might be noted of many culinary plants, that differ so much from their originals, that none but a botanist could detect the relationship. Nor is it in the external characters only that cultivation effects such changes: the intrinsic properties are equally liable to metamorphosis—as from sour to sweet, from acrid to agreeable, or even from poisonous to wholesome. The well-known garden celery is a native biennial found on the sides of ditches in the vicinity of the sea, and in this state is highly acrid, and of a coarse rank flavour. Culture, however, has now transformed the leaf-stalks of the common species into one of the most agreeable salads, and the bulbous roots of the celeriac into a wholesome and nutritious esculent.

As in roots and stems, so in *leaves* the influence of cultivation is manifested in a very marked and curious manner. 'The *Brassica oleracea*,' says Dr Neill, 'is a plant indigenous to our rocky shores; but no one seeing it waving its foliage in its native habitat, could possibly anticipate that it would ever appear in our gardens disguised as the ponderous drum-head or sugar-loaf cabbage, or on our tables as the delicate cauliflower and broccoli.' In the one case the stem is tough and slender; in the other it becomes fleshy and fusiform; when wild, the leaves are small and wavy; under favourable culture they become large and succulent, thickening so rapidly, that they have not actually room to unfold themselves, but gather into a *heart* or cluster several feet in circumference. The original colewort would weigh scarcely half an ounce; we have seen a well-nourished drum-head weigh more than thirty pounds. The *Crambe maritima*, another plant growing

spontaneously on the southern shores of our island, has in like manner been improved into the sea-kale of our markets: so it may be remarked of the artichoke, the endive, spinach, succory, and, in fact, of all our esculents and salads. It is owing to this protean susceptibility that, under cultivation, certain leaves become puckered, as in the curled cress and curled savoy; that notched and lobed ones become simple and entire; and that thin and leathery ones are transformed into thick and succulent masses.

The changes which occur in the *floral organs* are also very numerous; and on this feature depends all that beauty and variety which it is now so much the object of the florist to produce. These transformations consist in an increase of the petals, in a conversion of petals into stamens, and in some modification of the colour. What are called *double* flowers are produced by a multiplication of the petals, as in the common varieties of the rose; and *full* flowers are those in which the multiplication is carried so far as to obliterate the stamens and pistils. The rose, for example, produces in a wild state only a single row of petals, surrounding a vast number of yellow stamens; but when cultivated, many rows of petals are formed at the expense of the stamens, which are proportionally diminished in number. Compare the dog-rose of our hedges with the cabbage or Provence rose of the garden; or compare the single anemones and ranunculuses of the Levant with the finest Dutch varieties, and see what cultivation has produced. In the one case there are only five diminutive petals; in the other we have hundreds: the wild anemone is scarcely an inch across; Dutch florists have reared specimens more than six inches in diameter. The same may be remarked of the polyanthus, which is very unlike its parent, the primrose; of the auricula, the hyacinth, dahlia, and other floral favourites, which, under cultivation, have each sported into many hundred varieties. 'The dahlia,' says a recent authority, 'is a native of Mexico, from which it was introduced in 1789, but afterwards lost to our cultivators. It was reintroduced in 1804; but it was not till ten years later that it was generally known in our gardens. The first plants were single, of a pale purple colour, and though interesting, as affording a new form of floral ornament, they by no means held forth the infinite diversity of that tint and figure exhibited by their double-flowered successors. At present the varieties are endless, each district of the country possessing suites of its own, and cultivators occasionally raising at one sowing a dozen kinds which they think worthy of preservation. The results have been most propitious to the flower-garden, from which, indeed, the dahlia could now nearly as ill be spared as the potato from the kitchen-garden.'

With regard to the change of hues in the *colouring of flowers*—the streakings, the mottlings, and dashings—it is almost impossible to speak. 'Its infinite changes and metamorphoses in almost every cultivated flower,' says Dr Lindley, 'can be compared to nothing but the alterations caused in the plumage of birds, or in the hairs of animals by domestication. No cause has ever been assigned to these phenomena, nor has any attempt been made to determine the cause in plants. We are, however, in possession of the knowledge of some of the laws under which change of colour is effected. A blue flower will change to white or red, but not to bright yellow; a bright yellow flower will become white or red, but never blue. Thus the hyacinth, of which the primitive colour is blue, produces abundance of white or red varieties, but nothing that can be compared to bright yellow—the yellow hyacinths, as they are called, being a sort of pale yellow ochre, verging to green. Again, the ranunculus, which is originally of an intense yellow, sports into scarlet, red, purple, and almost any colour but blue. White flowers which have a tendency to produce red, will never sport to blue, although they will to yellow—the roses, for example, and the crysanthemums.' A few scanty observations such as these are all that can yet be offered by the naturalist respecting a subject which gives to many plants their sole value, and to all vegetation one of its chief attractions.

The changes produced by cultivation in the *fruit* or *seed* are also very numerous and obvious. Where, for instance, is there a native grain like wheat, or a native fruit like the apple? In a wild state, the seeds of our cereal grains (wheat, barley, oats, &c.) are thin and meagre: under proper culture, they become large, plump, and full of farina, so as to afford the most important elements of human subsistence. The small globular sour crab of our hedges is the original of the numberless varieties of apples now cultivated in our orchards, each variety differing somewhat in size, shape, colour, and flavour. In like manner with the sloe, which few could detect as the parent of our purple, yellow, and white plums; with the hazel-nut, which is the ancestor of the filbert and cub-nut; with the almond, which is the original of the peach and nectarine; with the diminutive wild lime, from which has sprung the shaddock, the orange, and lemon; and so also with the wild cherry, and with almost every species of our cultivated fruits. We not only can change their size, colour, and other external characters, but can transform them from dry, acrid, and noxious fruits, to fleshy, pleasant, and wholesome products.

The above are some of the more obvious and important effects produced by the ingenuity of man on the natural characters of plants, especially as exhibited in the roots, stems, leaves, and organs of fructification. We could add almost indefinitely to the list; but enough has been advanced to show that vegetation is endowed with a wide range of adaptability—a feature necessary, in the first instance, for its own preservation against the vicissitudes of soil and climate to which it may be subjected; and evidently fitted, in a secondary sense, to administer more fully to the growing requirements of civilised man. The results which have been accomplished refer but to an insignificant section of the vegetable races; and judging from these, we may be hopeful that there are yet thousands of species equally fitted, under cultivation, to administer to our support and gratification.

FIRESIDE CHIT-CHAT.

NO. I.

Stukely.—Well, such wonderful things are now done by machinery that I don't know what it is all to end in.

Gilaroo.—Wonderful indeed. I saw it stated the other day in a Manchester paper, that casks can now be made by machines—umbrellas, I know, have long been turned out by machinery.

Stuke.—You mean barrels, actual beer barrels?

Gil.—Certainly; but of course I only speak from hearsay. The staves, hoops, and heads, are in the first place dressed off by other machinery; then the real cask-making machine is fed with these prepared articles, and in two minutes' time turns out a complete and well-finished barrel. Old barrels can also be repaired by the same machine, the only difference in time being occupied in the taking of them to pieces previously to substituting such fresh staves, heads, or hoops, as may be required for the machine. The barrels, when completed, are superior to any heretofore turned out by manual labour, the machine fitting each stave as close as though the whole barrel had been formed of a single piece of timber. The inventor is said to be an operative, who would gladly take a patent for his machine, if he had the means.

Stuke.—Well, that is curious; but can it be believed? There is such a deal of stuff in the newspapers, that we never know how much to believe or disbelieve.

Gil.—True; too much nonsense, I allow. I see, however, that another invention is perfected and in use, which was only hinted at twelve months ago; and a very clever thing too it seems to be.

Stuke.—What is it; anything about steamboats?

Gil.—No; it is a clock which is to go by the dropping of water, a hydraulic clock it is called. I cannot say that I rightly understand it; but this is what is said about it. Attached to the axis of the crane-wheel, is a small bucket-wheel on which the propelling power, a single drop of water in a second, acts. The action of a pendulum keeps the motion in perfect regularity, and the other machinery is of the most simple description. It requires no winding up, and from its great durability in the absence of friction, it will be easily kept in repair. I am told it keeps time with great accuracy, and that one has been going well for the last nine months. I understand the inventor is a watchmaker in a village in Fife.

Stuke.—Much need of some improvement in clock-work. Every public clock in town has its own time. You may set off from one end of a street at six o'clock, and arrive at the other end at half-past five.

Gil.—No, no, Stukely, not quite so bad as that; however, I allow that things are in a bad way with public clocks, and as they rule watches, no man's watch gives exactly the same time as any other man's watch. It is a universal confusion of time. Nothing for it, however, but to regulate the time all over the country by London or Greenwich time, and to move every public clock in a town by magnetic wires from a common centre.

Stuke.—Well, well, I wish they would do something. Last summer, when residing for a short time at a country town, I found that the church clock was regulated by the watch of the driver of the stage-coach; and he kept the time always a quarter of an hour back for his own convenience.

Gil.—We shall have all this put to rights, I daresay, when the railways go everywhere. How easy it will be to regulate time by the electric telegraph! By the way, do you see that a wire from one of these telegraphs is being carried along the Edinburgh and Glasgow line?

Stuke.—I was not aware; but I am glad to hear of that apparatus being extended over the country. These triumphs of science almost reconcile one to the accidents which are still too frequently taking place on the various lines.

Gil.—You probably have not heard, either, of a clever and rather fine thing which took place the other day on the Edinburgh and Glasgow.

Stuke.—No; how was that?

Gil.—A traveller, on arriving in Edinburgh, missed his pocket-book, containing L.700. On making known his loss, a stoker told him that a man had followed him from the station, and had immediately afterwards returned and taken his place in a train for Glasgow. The gentleman ordered an express engine; and though some time was lost in getting up the steam, the engine came in sight of the train when approaching the inclined plane that leads down to Glasgow. The whistle of the express engine was violently blown, and the train in front went off to the other line of rails. The express shot past, and got to the station in time to admit of arrangements for apprehending the pickpocket. The train then came in: the suspected person was seen and identified by the stoker, who had accompanied the gentleman; and the pocket-book and money were found on his person. This was really well managed; but the best point in the story is to follow. The gentleman, overjoyed at recovering his money, offered a handsome reward to the stoker, which was resolutely refused; and the gentleman therefore inclosed L.100 to the directors, requesting them to take payment for the express, to reward their servant as they might see fit, and if there was any change, to forward it to him. The directors returned the whole sum; stating that they would make no charge for the engine, and would themselves reward the stoker!

Stuke.—Well, I do say that was capital. I hope the stoker has been rewarded.

Gil.—I don't go along with the general notion about rewards. Every man should do his duty in helping his fellow-creatures, because it is his duty to do so, and not for the sake of money. I don't like paying people for doing what is right. The pleasure of having done a good action is the best reward.

Stuke.—To hear you talk in this way! You know very well that few people bestir themselves one way or another without the hope of reward. The child at school cares nothing for learning; it only looks to the empty praise and the more solid prize which it may receive. Neither does the soldier fight for fighting's sake; he is always looking forward to promotion.

Gil.—Mean motives all.

Stuke.—Be it so; but we must take the world as we find it. Besides, there are so many rewards for doing mischief, or at least very questionable actions, that in fairness there should be also rewards for actions which are commendable. It will be long ere you demoralise the world by rewarding the performers of heroic or virtuous actions. You have, of course, heard of the famous Monthyon prizes in Paris?

Gil.—Certainly I have.

Stuke.—Then, are they not creditable to the nation? We have nothing like them. Great virtue or heroism under difficulties meets with not the slightest mark of public esteem in England. I will relate a case in point, which I have had partly from the Inverness Courier, and partly from private information. The island of Rona is a small and very rocky spot of land, lying between the Isle of Skye and the mainland of Applecross, and is well known to mariners for the rugged and dangerous nature of its coast. There is a famous place of refuge at its north-western extremity, called the 'Muckle Harbour,' of very difficult access, however, which, strange to say, is easier entered at night than during the day. At the extremity of this hyperborean solitude is the residence of a poor woman, named Widow Mackenzie, who is upwards of seventy years of age; her lonely cottage is called by sailors 'the lighthouse,' from the fact that she uniformly keeps a lamp burning in her little window at night. By keeping this light and the entrance of the harbour *open*, a strange vessel may enter with the greatest safety. During the silent watches of the night, the widow may be seen, like Norna of the Fitful Head, trimming her little lamp with oil, fearful that some frail bark may perish through her neglect; and for this she receives no manner of remuneration—it is pure and unmingled philanthropy. The poor woman's kindness does not rest even here, for she is unhappy until the benumbed and shivering mariner comes ashore to share her little board, and recruit himself at her glowing and cheerful fire; and she can seldom be prevailed upon to accept of any reward. She has saved more lives than Davy's belt, and thousands of pounds to the underwriters. This poor creature, in her younger days, saw her husband and three brothers drowned before her face; and she is known frequently to sit for hours on a rock gazing on the spot where they sank. Her only dependence now is on the produce of a cow and two or three goats; and no one resides with her but her daughter. Now, is not this a case of meritorious benevolence worthy of some mark of public approbation? Just compare it for a moment with what has been lately done by a great railway speculator to call forth a tribute of national gratitude.

Gil.—Don't speak of that abomination. I consider it nothing short of a national disgrace. Not that I, by any means, disparage this extraordinary son of fortune, whose doings in life have certainly been very wonderful; but this testimonial affair looks so like a mere piece of mammon-worship, that I cannot endure it.

Stuke.—That may be; but I don't give up my point. Certain actions are worthy of public reward; only I think it a pity that the reward is left so much a matter of accident or caprice. A Rowland Hill, for instance, may have only fifteen thousand pounds presented to him for a service which cannot be spoken of as less than a universal benefit; while the commander at a

victory gets a peerage and a pension for three generations. A private banking company known to me, actually, the other day, gave their discharged manager a pension exceeding the annual value of the tribute conferred upon the author of the penny post.

Gil.—Well, that may be. But talking of inequality in remunerations only serves to remind us that all rewards for services to mankind are on a vague footing. Can anything, for instance, be more absurd than that a light book of amusement, which will not be heard of in the next generation, realises greater gains to the author than could be derived from the profoundest and most widely and permanently useful philosophical work that any human being could pen? Such things show to me how absurd is the whole of the present system of gains, though I suppose it must run its course, and do a great deal more mischief before mankind be fit for anything better. By the way, have you observed the newspapers stating that a professor of phrenology has been appointed for the Andersonian university of Glasgow?

Stuke.—No, I did not, nor do I care. I consider phrenology to be nonsense.

Gil.—Of course, you have investigated it, to speak so decidedly.

Stuke.—Me! Not I. I have something else to think of. The idea of telling people's characters from the outsides of their skulls is too ridiculous to be thought of.

Gil.—You are wrong at the very first; for the outsides of people's skulls are only looked at as an indication of the volume of brain within; and that may well be a point of importance, as the brain is, by general acknowledgment, the organ of the mind. Many a thing, too, has been laughed at, which, in the long run, turned out to be true. The right way is not to laugh at, but examine new discoveries, real or alleged. I cannot say I am altogether a believer in phrenology myself, but I like fair play, and should wish to see it thoroughly and candidly investigated. The appointment of a professor in such a school as the Andersonian university, seems to me a good move. It lifts the science into a position which will compel at least respectful consideration, and that I suppose is all its adherents are in the meanwhile anxious about. How curious the manner in which craniology from Gall's time has battled its way up to this point! Honour to the man who——

Stuke.—Stop, stop, for any sake; you are getting into one of your high flights, and that I have no time for. So, good-night, Gilaroo; good-night.

SUCCESS.

The most important element of success is economy—economy of money and economy of time. By economy we do not mean penuriousness, but merely such wholesome thrift as will disincline us to spend our time or money without an adequate return either in gain or enjoyment. An economical application of time brings leisure and method, and enables us to drive our business, instead of our business driving us. There is nothing attended with results so disastrous as such a miscalculation of our time and means as will involve us in perpetual hurry and difficulty. The brightest talents must be ineffective under such a pressure, and a life of expedients has no end but penury. Worldly success, however, though universally coveted, can be only desirable in so far as it contributes to happiness, and it will contribute to happiness very little, unless there be cultivated a lively benevolence to every animated being. 'Happiness,' it has been finely observed, 'is in the proportion of the number of things we love, and the number of things that love us.' To this sentiment we most cordially subscribe, and we should wish to see it written on the tablet of every heart, and producing its fruits of charity. The man, whatever be his fame or fortune, or intelligence, who can treat lightly another's wo—who is not bound to his fellow-men by the magic tie of sympathy, deserves, ay, and will obtain, the contempt of human kind. Upon him all the gifts of fortune are thrown away. Happiness he has none. His life is a dream, a mere lethargy, without a throb of human emotion; and he will descend to the grave 'unwept, unhonoured, and unsung.' Such a fate is not to be envied; and let those who are intent upon success, remember that success is nothing without happiness.—*Newspaper paragraph.*

THE VAULT OF THE PRINCES.

[Translated from the German of Schubart (born 1739, died 1791). We present this piece, as a specimen of a series of translations from German poets, executed by Mr Gostick, and just published by Mr Smith of Fleet Street. The volume, which is entitled 'The Spirit of German Poetry,' is remarkable as a copyright work now presented for the first time in a cheap form. The translations and connecting prose matter, which is of a critical and biographical nature, seem to us well executed.]

And here they lie—these ashes of proud princes,
Once clad in proud array,
Here lie their bones, in the melancholy glimmer
Of the pale dying day.

And their old coffins from the vault are gleaming,
Like rotten timber, side by side,
And silver family-shields are faintly beaming—
Their last display of pride!

Here vanity, reclining on a bier,
Looks out from hollow sockets still;
Quenched are the fiery balls that from these skulls
Could look and kill.

Here marble angels weep beside their urns,
Cold tears of stone for aye—
The Italian sculptor (*smiling all the while*)
Carved out their false array.

The mighty hand is but a mouldering bone
That once held life and death—
See that frail breast-bone, heaving once so high
Bright stars and gold beneath!

O wake them not, but let them soundly sleep;
For cruel was their reign,
But scare yon ravens, lest their croakings wake
Wutherich to life again.

O wake them not—the scourges of their race—
Earth has for them no room—
Soon, soon enough will over them be rattling
The thunders of their doom!

APPROPRIATE MONUMENTS.

Whilst walking about the churchyard of Stolpen in Saxony, I remarked a group of basaltic columns tastefully placed over a grave. Such a sight could not fail to bring to mind the recent loss of the celebrated geologist of France (Dolomieu), who has treated so well of basalt; and I could not help thinking that a similar simple mineralogical trophy might, with propriety, be raised over his tomb, as calculated to perpetuate the memory of his labours. In former times, a sphere circumscribed by a cylinder was placed over the sepulchre of Archimedes; a spiral logarithmic curve was inscribed upon the monument of Bernouilli; and both emblems were equally fitted to recall the attention of posterity to the discoveries and writings of these eminent men.—*Daubuisson in* 1803.

THE STUDY OF NATURE.

The sneers of superficial men upon the weakness which has appeared in the conduct of some inquirers into nature, ought to have no influence to discourage us from those researches. If some few have spent too much time in the study of insects, to the neglect of the nobler parts of creation, their error ought to suggest to us, not a total neglect of those inferior parts of nature, but only to avoid the mistake of giving ourselves wholly to them. There is no species which infinite Wisdom has thought worth making and preserving for ages, that is not supremely worthy of our inquiring into its nature. And it is certain that there is more of curious workmanship in the structure of the body of the meanest reptile, than in the most complicated and most delicate machine that ever was or will be constructed by human hands.—*James Burgh*, 1754.

EMULATION.

We frequently hear of a 'noble emulation;' but it is questionable at least whether the expression does not involve a contradiction in terms. In the first place, what is emulation? It is simply and essentially a desire to be before another. We may be emulous either of excelling in what we believe to be good, or of outmatching in what we know to be evil; but in either case the motive power—the emulation—is a desire to get the better of another; in other words, to exalt and benefit self.

Now, all that is really 'noble' in our nature has entire reference to the well-being and happiness of others. True nobility is based upon self-sacrifice, not upon self-advancement. It is the servant of all, not the vain-glorious patron. It seeks the happiness of others—not for the sake of outrivalling a fellow-worker, but because it delights to see others happy. Is it not clear, then, that emulation—the crowning star in the diadem of pagan morality—implies a littleness of mind, a self-regarding spirit, inconsistent with that real nobility of soul, that god-like disposition, which it was the great purpose of Christianity to develope?

It is not denied that a spirit of emulation and rivalry has often incited men to acts of usefulness, when higher and purer motives would have failed; nor would we with niggard lips withhold the praise which every useful action may command. The hireling is worthy of his hire. All we contend for is, that genuine nobility is self-denying—that it belongs to a singleness of purpose—and that purpose the common good of all. The essential littleness, however, of a spirit of rivalry, considered as a motive to action, may be seen in its practical results. It destroys moral independence, and renders a life of usefulness or of indolence perpetually contingent upon the presence and conduct of a rival. It has no innate life—no heaven-imparted energy. Like the fabled vampire, it sucks its life-blood from another's veins, and lives only in its victim's death. It cannot act spontaneously; and it co-operates only to ensnare or to destroy. If emulation has given rise to much that is useful, it has also been the prolific parent of bitter heart-burnings and envious thoughts. It has awakened animosities, jealousies, and hatred, in the bosoms of those who should have been as friends and brothers in the same good cause. Like earth-born life, it carries with it the elements of decomposition and death.

Was it the earthly fire of emulation that warmed the breasts of Howard, of Wilberforce, or of Oberlin? Or was it a living sympathy with their suffering and degenerated brethren that glowed within their hearts? If the former, then, however exalted in their own opinions, or in the opinion of an admiring world, they could not have been—as we reverently believe they were—men of God's nobility: God's messengers of glad tidings to the three great families of human wretchedness—the depraved, the oppressed, and the ignorant.

But, it may be asked, can we not be nobly emulous of doing good? Can we not nobly vie with each other in benefiting our fellow-creatures? When used metaphorically, such language may be quite allowable; but in plain and sober reason, we cannot. The very wish to do more good than another, implies an indifference to the interests of that other person, and an undue anxiety about our own, which is incompatible with the universality of true nobleness.

It is not, however, in the public or more important actions of our lives only, that this principle of Christian nobility should be observed. It is equally applicable to all, however trivial or apparently unimportant. There is often in one kind word, one look of sympathising affection, or one small act of disinterested love, more of real nobleness of spirit than in actions which have rung in the ears and found an echo in the hearts of admiring thousands. There is a 'still small voice' within, which is of more value than the acclamations of the world. And it is in the more humble duties of life—in our daily intercourse with each other—in the quiet, the sweet, the unseen circle of domestic affection, that the singleness of purpose here recommended is really most important. It is here that the more lovely and gentle feelings of our nature may be brought into a pure and peaceful existence; and it is here that we are called upon to make a more cheerful and entire surrender of our selfishness. And yet, how often may we detect ourselves yielding to its unhallowed impulse! How often do our petty quarrels, our bad tempers, our selfish indulgences, interfere with the union and harmony that should ever be associated with the thought of home! It was at home our earliest days were spent; it was at home the time of fond, innocent, confiding childhood was passed; and though this may not have been really the happiest period of our earthly existence, yet is it one to which the tired soul delights to revert with a fond and grateful remembrance. Happy are they who have that remembrance treasured within their hearts!

But to return to our more immediate subject: although emulation may be seen to be a corrupt and corrupting passion, yet, knowing that it has ever exercised a powerful influence over the world's destinies, both for good and for evil, it will be well to ascertain distinctly the source from whence it has sprung, so that we may each of us be better able to turn the original and uncorrupted stream into its native channel, and thus enjoy the benefit it is intended to confer, while at the same time we avoid the accompanying evil.

The desire to be thought well of by our fellow-creatures, although essentially self-regarding, is a feeling possessed more or less strongly by all; and when

rightly directed and restrained, it is not only the occasion of much unmixed good to others, but it is also the source of many pure and delightful emotions to its possessor—to reject which would be to follow the example of those stoical religionists, who seem to imagine that, in order to obtain the approbation of their Maker, they must learn to despise all the pleasures which he has beneficently placed at their disposal, and render themselves as independent of his bounty as their frailties will admit. There is, even in the best regulated minds, a principle of self-love which, when legitimately manifested, appears to be necessary, not only to the preservation of individual existence, but also to constitute the basis of individual identity. Perhaps not one of the world's great men could be pointed out who did not or does not possess what may be called a strong selfhood. In order to control opposing circumstances, and mould men's desires and aspirations to their will (whether for good or for evil), it seems absolutely necessary that they should feel strongly their own individuality. The higher and purer feelings cannot afford the requisite stamina: they are descended from heaven; but they require a plane from which they may be reflected; and that plane must be found in our own selfhood.

There can be no action without reaction. The ball could not be forcibly propelled through the air, unless the cannon were fixed and immoveable. The lever could not raise the weight, unless it had a fulcrum whereon to rest. We could not even walk erect upon the earth, unless the ground resisted our tread. And neither could piety, conscientiousness, or benevolence become developed in a life of active usefulness, unless they had a foundation in a strong and unvacillating selfhood. In vain should we sympathise with the distresses of others, unless we felt that we could do something for their relief; in vain should we wish to see injustice banished from the earth, unless some one felt himself called upon to assist in its removal. It must be clear, that without some degree of self-confidence we could do nothing. And yet the same principle that imparts this stability and energy to the mind, becomes, when wrongly manifested, the life and origin of every evil passion.

What then is to be done? Our selfhood cannot be destroyed; for it is not only inherent in our nature, but essential to individual existence. The answer is evident: it must constitute *only* the foundation, and not monopolise the whole mind. It must be merely the fulcrum, and not the power by which the lever is moved. It must serve the higher principles, not rule them. It must be the means by which we act, *not the motive to action*. That which we have to sacrifice is not our entire selfhood, but our selfish desires and motives. The great purpose of our lives, the ruling motive of all our actions, should be to make ourselves not merely agreeable, but useful to each other. This does not imply, indeed it is incompatible with, a reckless abandonment of self. In order to make the best use of our powers and opportunities, we must act with prudence, we must exercise our judgments, and practise self-denial in all its varied forms. We must learn not only to deny improper gratifications to ourselves, but also to decline administering them to others—even at the risk of giving offence; for if we do not, we sacrifice what we believe to be their real advantage to our own selfish love of praise. If we always act with an intelligent and sincere desire to be useful, there will be but little danger of our forgetting what is due either to ourselves or to others. A love of being useful, although not the source, is at least the basis of every virtue; and it is only because the essential selfishness of emulation has been concealed beneath an accidental covering of usefulness, that it has attained its present position in the code of the world's morality. It is really but an ungenerous manifestation of the desire for fame.

Emulation, however, is not the only selfish passion that has thus served its time in the history of man, and become by him falsely regarded as a positive virtue. The love of dominion, revenge, avarice, and all other passions that stimulate to active exertions, have, by the good arrangement of Providence, been rendered in some way conducive to the general good; and they have all been extolled by their respective votaries as the legitimate and leading principles of our lives. But society is evidently advancing towards the pure and perfect. Principles of action which formerly passed current unchallenged, must now submit to a rigid scrutiny. Away with all that will not stand the test of reason and universal good! Let each of us examine honestly his own motives, and reject those which are inconsistent with the real good of others, and we may rest assured that in thus obeying the laws of God, and promoting the happiness of each other, we shall be adopting the only course that will necessarily ensure our own. And finally, in reference to all motives of emulation, let us ever remember that while we should always desire the esteem of the upright and intelligent, there can be no real good in wishing to outrival another.

OWEN AND LARRY.

As must be pretty generally known, the main consideration with every labouring man in Ireland is his potato-field, or *garden*. This patch of ground is the grand subject of thought and occupation; and such must necessarily be the case, until employment of a general kind is found by the Irish peasantry. Does the Irishman think of marrying, his first care is to secure 'a garden:' as a necessary consequence, there still must be a garden to provide support for the annual additions entailed by this step; and as a fresh spot is generally tilled each year by the hundreds and thousands—ay, millions—who, without a rood of ground of their own, must procure it at any cost, no wonder that 'the garden' should be, as we have said, an all-engrossing theme.

Our readers may therefore well imagine the dismay which lately spread amongst an ignorant and credulous population, when not only the hope of their gains, but the hope of their very life, seemed gone; nor is it surprising that the field thus opened was soon occupied by the crafty and unprincipled, that many a speculation was formed, many a stratagem resorted to, and the evil magnified in many an instance, to form an excuse for the evasion of legitimate claims. At the moment we are writing, we receive assurance that the calamity was at first over-estimated. Alarm, in its worst form, appears to be passing away. But, while rejoicing in the improved prospects of our poor neighbours, we have also to mourn over the new revelations which have been given of characters formerly above suspicion. We deplore that any should have been found heartless enough to seek their own profit out of the sufferings of their friends. Yet such was the case. The potato failure of 1845 will be memorable for more than the privations it may occasion.

In our immediate circle of observation, there are at least two or three individuals who will probably never forget 'the disorder,' as this failure has been locally termed. Owen Lynch and Larry Sullivan were neighbours in the little village of Crobeg, and though as unlike in disposition and pursuits as can well be imagined, there were just at this time some points of similarity which brought them into agreement, or rather into connexion, in a manner materially influencing their future lot. Owen was a shoemaker, though perhaps, considering his local opportunities, the term cobbler would be more appropriate; at any rate, like his more celebrated predecessor, 'who lived in his stall,' 'none was more blithe and contented than he;' and if he did sit on the lowest step of his profession, why, it is not the office exalts the man, but the man the office.

Owen had a frank, honest countenance, a most happy disposition, and an unblemished character: but he had

more: intelligent and ingenious withal, he had books for his leisure moments, which furnished thoughts for his busy hours, and those, again, were transmuted into many a little plan, not only for his own comfort, but for the improvement of his more ignorant companions; and though many, too indolent themselves to adopt his suggestions, sneered at what they called his particularities, there were many more who had to thank him for showing them how practicable simple pleasures are. The sweet bird cheering him with its song, the wild flowers in his window, the brightness of that window, the whitewashed walls, the cleanly floor, though all apparent trifles, still spoke of civilised tastes and habits, and made his cottage, we must confess, quite conspicuous amongst the habitations of Crobeg: not that Owen thought its arrangements perfect. Did we say he was happy? Ah! not quite; he had long coveted a sweeter bird, a brighter flower; but we must not anticipate.

His neighbour Larry was of quite another stamp; his was no ignoble trade, and he evidently took pride in its superiority. He was a carpenter, and, with common steadiness, might soon have been as independent as he was clever; but Larry had too much ingenuity. He was a man of many expedients; and scorning the rectilineal principles of his craft, the crooked way had ever more charms for him than the straight. He ever preferred to gain his object by skilfully misleading or overreaching another; indeed he seemed to consider this faculty quite in the light of an accomplishment, and his favourite maxim was, 'Only for fools, wise men could not live.' With such a propensity, it might be supposed Larry was not a very popular character; and yet, such is worldly estimation, he was often an admitted and favoured associate where the intrinsic worth of Owen could hardly make any progress; but Larry was handsome, off-hand, and lively. He made his gains lightly, and parted with them as lightly again; and though many had winced at his double dealing, and many more might expect to do so, yet he told out the tale of his cleverness so freely, that it seemed almost done for fun, and those who joined in his laugh could hardly find fault with his story. We need hardly add, that with the fairer portion of his acquaintances he was a general favourite; no partner so desired at a pattern, no escort to a fair so coveted: his attentions conferred distinction, and his approval brought applause. One alone, and she the best and fairest, held aloof from this flattering notice. Perhaps she thought it too lavishly, too universally bestowed; perhaps she wished to enhance what seemed too lightly valued; or perhaps her heart had selected another standard. Who may guess? Why, of all the fair maidens of Crobeg, none seemed so indifferent to his attentions as Aileen Doyle, and yet none could so easily have secured them.

Sweet Aileen! who can describe her? And yet, dear reader, have you ever seen a print of Maclise's 'Irish Hood?' Well, then, we do believe Aileen must have sat for that picture; or that, in some of the artist's far-off rural wanderings, he might have passed by the chapel where she knelt, and transferred her fair face to his unfading canvas. And yet not always are those fringed lids thus cast down, not always is that rosy mouth so grave; those hazel eyes can laugh right merrily and saucily too, and an arch bright smile can part those lips, and show the snowy pearls within. And, Aileen, you must throw back that shadowy hood, and show the sunshine that ever lingers on the smooth braids of your nut-brown hair, and talk to us a little, till we see the warm blood mantling again in that soft cheek. There now, we have her at her spinning-wheel, the day's more active labours over: she has swept up the floor, set the potatoes on the fire, and laid a coarse clean cloth for her father's supper; and now she sits down, not to idle, but to while away the time till he comes. And Aileen is not alone: Larry Sullivan had stepped in to see her father, but she loses no time while he lingers; and half-gaily, half-demurely, she raises her soft eyes now and then, as she listens in seeming attention to his words. She has listened with attention, but not with indulgence, and a heightened colour on the cheek of each shows some embarrassment in the pause that has now ensued: but again the silence was broken, and Larry resumed—'It is not fair to bring up old scores, Aileen, and I doing my best for the last half year to please you. Did I not take the pledge, though Paddy Brim at the public was my oldest friend? And well was I proved coming from Limerick the other night: not a drop would I let inside my lips, though they were shivering from the frost; and many a time I was provoked; let alone Norry Connors asking me to thrate her.'

Again the soft eyes smiled; but the answer was in a careless tone—'Oh, you never were fond of that sort of comfort, provoke you who might; so don't say you refused Norry Connors to please me.'

'Sorrow another reason then, Aileen: I have turned my back on them all now for your sake. Come now,' persisted her admirer, 'don't be so contrary. Advent is coming on, and there is no time to lose. Why, if you don't make up your mind, that regular old bachelor, Owen Lynch, will get the start of us. They say he is only waiting till the garden is dug, to speak to the priest.'

A penetrating look accompanied this piece of information; and certainly, had Larry's destiny hung on the thread his companion was spinning, it was severed at that moment; and when the fair head was raised again, after stooping to remedy the mischance, the flushed cheek betrayed some annoyance or emotion; but she answered calmly, 'And when will you have your garden dug? It would be fitter for you to go about it, Larry, than to be shuling here.'

'My garden,' answered Larry laughing; 'wisha then, machree, I'll leave my garden alone till I get it for nothing.'

'Till 'tis worth nothing, I suppose you mean?' said Aileen composedly; 'if the frost once sets in, what with that and "the disorder," you will have little to dig.'

'Oh, mine is high and dry: I'm not afraid of the frost; and as to the disorder, I don't think there is more than a barrel touched in the entire acre—though that is between ourselves,' added he quickly. 'A very different story I had for Mr Pyne.'

'And why so?' asked Aileen wonderingly. 'Mr Pyne is a kind man, and could have no greater pleasure than to hear your crop was thriving.'

'Arrah then, Aileen! how simple you are,' said Larry with an incredulous smile, 'as if you didn't know that the best of my play is to persuade Mr Pyne that the crop is not worth the digging. I am sure of getting it for little or nothing; for I told him I would sooner leave it to him entirely, than pay him the rent of the acre; and though he gave me till to-day by way of considering, I just sent him the same message again; and I'll be bound he'll give it at my own price, for he is in a hurry to get the ground clear for the wheat.'

'Oh, Larry, you could not act so,' exclaimed Aileen, while her cheek flushed and her eye lightened with an expression of indignant earnestness—'you could not take advantage of a gentleman's kindness to deceive him—you could not surely be so ungrateful to the High Hand that spared your crop, to go and belie it now? And it would be no use for you,' added she: 'remember my words—if you persist in this, you will be without your garden. Mr Pyne will see through you, and take you at your offer—for he is no fool; and then what would you do, Larry? Where in the wide world would you face, and your garden gone? Be advised by me: go up with the first light, and tell him you are sorry for that message.'

'Ah, catch me at that,' cried he; 'women don't understand these matters; and yet,' added he suddenly, with his most insinuating look, 'tell me to do it for your sake, Aileen, and it will be another story.' He was about to take her hand, when her father's step was heard approaching, and he had barely time to reiterate his

question in a low and earnest tone—'for *your* sake, Aileen?'

'For God's sake and your own, Larry, and no more,' was the hurried answer; and turning with a smile of welcome to her father, she drew a long sigh of relief as he entered the house. Whatever was Larry's original business, it was unheeded now, and he shortly took his leave. Aileen busied herself about her father's supper, and noticed him no further; but she could not conceal an unusual abstraction, and looked up in some trepidation when her father told her she need not hurry herself with supper for a while. 'And come here, asthore!' added he, 'I want to talk to you for a moment: have nothing to say to that schemer that was in here just now. I'm not angry with you, Aileen; for how could your innocent heart be supposed to know him? but I warn you now, and that's enough. He had the assurance,' added the old man warmly, 'to ask me for my child to-day, and he knowing himself to be thrown on the winter without a meal's provision for himself, let alone another; and, what was worse, to be reduced to that by his own scheming too. Yes, Aileen, he thought to have come round Mr Pyne, because he was a good man; but the better he was, the more he was hurt at such roguery, and when he got a message this morning, still huxtering about the garden, he sent in his own horses, ploughed out the potatoes in no time, and has them all in the house by this. And to think that fellow wanted to get my Aileen after such behaviour, and he without a scrap of a garden now.'

'Oh, father, he did not know that,' cried Aileen; 'he had no notion Mr Pyne would take him so short.'

'But I tell you, child, he did know it,' said old Darby half angrily; 'more like himself to decave you; and Mr Pyne did not take him short; he made him offers galore; and it was not till he saw he was bent on cheating, that he took it out of his hands. I thought to give the lad a piece of my mind when I saw him here to-night, but he made off too quick.'

''Twas better not, father,' said Aileen in a low sad voice; 'he had enough to vex him then.'

Darby looked at her intently for a moment, then with a smothered sigh turned away; but Aileen followed him to the window, and putting her arms round his neck, looked up into his face with her sweet clear eyes, and said, 'Don't be uneasy, father, about your own colleen; we are of one mind in this; but for all that, it is not for us to give poor Larry the hard word; he has trouble enough, and little comfort now.'

Her father's countenance brightened as she spoke, and returning her caress, he answered fondly, 'God bless you, my own Aileen; whoever has you will never want comfort; but we will think of this no more: go now and lay another plate on the table, for Owen Lynch said he would step over to supper.'

'Owen Lynch, father?' cried Aileen, colouring deeply. 'Oh, father, we have nothing ready good enough for him; they say he is in a manner as particular as one of the gentry in his own house.'

'Nothing good enough for him! Do you think so, Aileen?' asked her father with a quiet smile; but she turned quickly, almost impatiently away, and he continued more gravely—'It is my turn now to ask you to spare the hard word; and little he deserves it. I may thank him and his good advice for the plenty I have in my field to-day; he is a blessing to us all, and he is blessed himself, and has the best garden in all the country; and if you saw him to-day, directing them all how to make their pits, how to use the damaged praties, and how to save the good ones, you would say there were few had more sense in the head or goodness in the heart.'

Aileen had no time to reply, for the subject of their conversation entered, and shaking off her recent depression, she received him with a cordial friendliness most gratifying to her father. Their talk of course turned on the prevailing topic, narrowed into the circle of their own immediate neighbourhood, especially of the field they had just quitted; and Darby, compa
different lots, remarked, 'I was just telling Aile
a lucky day you advised me to plant the pratie
you see them that cut them had twice the failu

detail the slow progress of his sufferings: the
recovery at last arrived; and need we tell that
time warmer, kindlier feelings were busy in th
of each. It has ever been the same story; an
Owen was at length able to walk for the fir
across the room, he was supported by the arm
betrothed bride. To her, and to her only, he c
the circumstances of his injury. He had hardly
the door, when he was followed and seized from
he struggled to free himself; and then his as
raising his arm, gave him a blow with a heav
which felled him to the ground. At that mo
light from the window flashed upon the face
enemy, and revealed the features of Larry Sulliv
slight shudder passed through Aileen's frame, a

raised her eyes timidly to Owen's, as about to speak; but he drew her fondly towards him, and silencing her as lovers best know how, he continued—'I think I know all, Aileen, and can hardly blame the poor fellow: he was maddened by the loss of his garden, and the loss of what was better far: and at that moment he saw me coming out, and perhaps thought me a happier man than I really was; so no wonder if he did not well know what he was doing.'

'Ah, Owen,' answered Aileen, gravely shaking her head, 'it was no sudden burst: I saw that very day he bore you no good will; but I little thought——' She paused a while, and then added—'From the moment he told me about the garden, my notion of him changed entirely; I saw the truth was not in him, nor the settled way. Until then I thought him harmless, though maybe too wild: but that day, though he tried to seem his best, showed me he was wicked at heart. What good,' continued she with an earnest simplicity that almost made her companion smile—'what good could come of any man who could speak so lightly of deceit and treachery, and of throwing up his garden like the dirt of the road?'

And Aileen was right in the warning she had given Larry. The loss of his garden, and the loss of his love, made him entirely reckless: he did not await the consequences of his nocturnal encounter with Owen, the danger or the disgrace, but enlisting in a regiment just about to sail for India, left the village, probably for ever. And Owen, with his beloved Aileen, look forward to next Shrovetide for the fulfilment of their hopes, brighter far than they once could have ventured to indulge; for Mr Pyne has rewarded Owen's usefulness and intelligence with a small farm, and thus accomplished the height of his ambition. Aileen's fortune is to provide the stock; and often, while listening to the lovers discussing their plans, old Darby will silently rub his hands together with a smile of self-congratulation, and then half audibly ejaculate, 'Just think of a man without a garden asking for my Aileen!'

BEN JONSON.

The 'Shakspeare Society' has recently illustrated some points of interest in the life of Ben Jonson, the great founder of English comedy, and the most distinguished of all Shakspeare's contemporaries. A singular life was that of 'rare Ben,' compounded of seemingly discordant elements, and presenting strange and vivid contrasts. It was a comedy in action, with a dash of the melodrama, like thunder and lightning, amidst the scene. Milton has written a sonnet on his attaining the age of twenty-three, at which time he had done nothing more than 'dream away his years in the arms of studious retirement, like Endymion with the moon on Latmus hill.' Ben Jonson was dreaming and working after another sort. Before he was twenty-three, he had studied his grammar with good Master Camden, Clarencieux, and had wrought as a bricklayer with his stepfather; he went next as a soldier to the Low Countries, where, as he boasted, he had, in the face of both camps, killed a man, and taken *opima spolia* from him; then he returned and took to study again, but soon became a player—a very indifferent one—and a dramatist of all work. He married, and had two children, and was the author of one of the best comedies in the English language (Every Man in His Humour), and all this before

> Time, the subtle thief of youth,
> Stole on his wing his three-and-twentieth year.

In two more years, Ben was deep in dramatic composition, and had killed another man! The latter was an unfortunate affair. Jonson quarrelled with an actor named Gabriel Spencer, and, being 'appealed to the fields, he killed his adversary, who had hurt him in the arm, and whose sword was ten inches longer than his.' For this fatal passage-at-arms Ben was imprisoned, and almost brought to the gallows. Two spies, he says, were set over him in prison, to take advantage of him; but, being forewarned by his keeper, he baffled their efforts to entrap him, and got clear off without a trial. He revenged himself on the spies with this downright epigram—

> Spies, you are lights in the state, but of base stuff,
> Who, when you've burnt yourselves down to the snuff,
> Stink, and are thrown away—end fair enough!

There was a spy of a different kind—a friendly eavesdropper—whom Ben did not shake off so easily. A Roman Catholic priest found his way to the player's cell, and made a convert of him. 'Thereafter he was twelve years a Papist;' but was reconciled again to his mother church; and at his first communion, in token of true reconciliation, he drank out the full cup of wine! Ben did nothing by halves. He seems to have been twice again in prison; on one occasion for joining with Chapman and Marston in writing against the Scottish nation, to the scandal of King James and his northern courtiers. They expected to have their ears cut and their noses slit; but the rage of James was appeased without any such tragic denouement. After his delivery, Ben banquetted all his friends, among whom were Camden and Selden; and in the midst of the feast his old mother drank to him, and showed him a paper of 'strong lusty poison,' which she intended, if the sentence had taken execution, to have mixed in his drink; and—'for she was no churl'—she meant also to have drunk of it herself! Jonson must have 'taken after his mother.' That the poet should have written against the Scotch, was almost a parricidal offence; for Ben was half a Scot by birth. His grandfather was from Annandale (no doubt a Border Johnstone), who served under Henry VIII. His father lost his estate in the reign of Mary, and after suffering imprisonment, turned minister, but died a month before his illustrious son was born. Jonson's birth is now fixed in the year 1573, not 1574, as stated by Gifford and other biographers.*

Ben Jonson was a traveller. He was in France in 1613, as we learn from one of his own frank and curious confessions related to Drummond:—

'Sir Walter Raleigh sent him governor with his son, anno 1613, to France. This youth being knavishly inclined, among other pastimes caused him to be drunken, and dead drunk, so that he knew not where he was; thereafter laid him on a car, which he made to be drawn by pioneers through the streets, at every corner showing his governor stretched out, and telling them that it was a more lively image of the crucifix than anything they had.'

In the summer of 1618, Ben made his memorable journey to Scotland *on foot*. King James had visited his native country the year before, and the dramatist (who was then a devoted courtier) must have been

* The error arose from a cause worth mentioning, as connected with historical dates. In England, at this time and long afterwards, the year was reckoned as commencing on the 25th of March; but in Scotland this computation was changed, and our present mode adopted, from and after the 1st of January 1601. Jonson's age was ascertained from some verses which he wrote in Scotland in January 1619, not in January 1619-20, as Mr Gifford states. See Mr David Laing's edition of Ben Jonson's Conversations with Drummond, published by the Shakspeare Society. Mr Laing conferred a great favour on the lovers of our early literature by this carefully-edited reprint.

aware that he would gratify his sovereign no less than himself, by undertaking a journey to the north, and describing its scenery and people. Dr Johnson's Tour to the Hebrides, at the age of sixty-four, was a wonderful feat; but the lexicographer trusted to post-chaises, guides, and horses; and he, moreover, had the indefatigable Boswell for his purveyor and companion. The dramatist set out alone, to walk the whole way from the Thames to the Tweed and the Forth. He was of huge bulk, with a 'mountain belly and a rocky face,' as he tells us, and

> His hundred of grey hairs
> Told five-and-forty years.

He remained in Scotland about five months, leaving it on the 19th of January 1619, and arriving in London some three months afterwards. There would be various jovial meetings with English worthies by the way! Jonson seems to have visited Loch Lomond, and meditated a poem, or pastoral drama, on that beautiful locality. He was well received by the Scottish gentry, and on his return, he remembered with affection the 'beloved Fentons, the Nisbets, the Scotts, the Livingstons, and all the other honest and honoured names.' With Drummond of Hawthornden he remained some weeks. This was the last of his principal visits, and it was the most important, for Drummond privately took notes of his guest's conversation and opinions, and thus preserved several curious particulars and traits of character. Drummond has been charged with treachery, in receiving and entertaining Jonson, for the purpose, as is alleged, of recording his foibles and opinions, and noting down his defects. The charge, however, is altogether unwarranted. Drummond never published his memoranda, though he survived Jonson twelve years; and nothing has transpired to show that the notes were inaccurate. That their general effect is unfavourable to Jonson, may be accounted for, without detracting from the substantial merits of either party. Judging from the slightness of the notices of such men as Shakspeare and Spencer, Drummond does not seem to have attempted to 'draw out' his visitor. Of Sidney, Raleigh, Bacon, and other glories of Elizabeth's court, Jonson could have furnished interesting anecdotes and particulars; but few are given. Of the virgin queen herself, Ben reported—

'Queen Elizabeth never saw herself, after she became old, in a true glass: they painted her, and sometimes would vermilion her nose. She had always, about Christmas evens, set dice, that threw sixes or fives—and she knew not they were other—to make her win, and esteem herself fortunate;' a characteristic of the weakness that was blended with this remarkable sovereign's masculine character. Of Bacon we are told—'My Lord Chancellor of England wringeth his speeches from the strings of his band'—a slight personal trait, that one is pleased to know of so great a man. The critical opinions delivered by Jonson were harsh and crude, and evidently distasteful to Drummond. Most of them have that tone of arrogance and boasting which exposed Jonson to so much animosity and ridicule in his own day. He did not realise the fine picture he has drawn of critics in 'Cynthia's Revels'— a man, 'so truly learned, that he affected not to show it; who would think and speak his thought freely; but was as distant from depraving another man's merit as proclaiming his own;' and '*for his valour, 'tis such that he dares as little to offer any injury, as to receive one.*'

The Scottish poet, however, judged his English brother somewhat too sharply, and did not make sufficient allowance for his position and peculiar temperament. He should have forborne from a final summing up. Ben certainly forgot himself sometimes over his cups—sat too late, and drank too much—for he was not niggardly of his own hospitality—and, recollecting perhaps the struggles and difficulties he had overcome, he glorified himself too loftily and ostentatiously on his success, his talents and his acquaintance with the great. From some of his depreciatory remarks on his contemporaries, we may appeal from his after-dinner sallies to the generous tributes and friendly memorials in his published works. *There* the young and gifted Francis Beaumont and the 'gentle Shakspeare' receive a full measure of justice and of praise. Jonson had resolved to write an account of his 'foot pilgrimage.' He got Drummond to send him some information, and had proceeded a certain length with his task, but unfortunately a fire broke out in his house, and consumed his manuscripts. History, poetry, translation, grammar, and divinity,

> Wherein was oil, beside the succours spent
> Which noble Carew, Cotton, Selden lent,

perished in the flames; and, as we further learn from his hearty 'Execration upon Vulcan,'

> Among
> The rest, my journey into Scotland sung,
> With all the adventures.

This was a serious loss, and the poet seems to have despaired of replacing it.

Dryden has said, in a well-known couplet, that great wits are nearly allied to madness. The position has been disputed with complete success, for the highest wit or genius has ever been, and must be, united to a sound understanding and healthy temperament. Even in our cloudy ungenial climate, no trace of this baleful consanguinity has been found among the truly inventive and great original minds. Chaucer, Shakspeare, Milton, Fielding, and Walter Scott, were active, lively, and sensible men. Their 'garlands and singing robes' never impeded their free motion in this ordinary work-day world. We sometimes, however, discover a strong melancholy and incipient hypochondria in the case of men of bright, but irregular and secondary, genius—as Ben Jonson, Dr Johnson, Byron, and Coleridge—arising from physical or constitutional infirmity, heightened in some instances by intemperance. Ben Jonson's melancholy at times assumed a ludicrous and fantastic form. He told Drummond that he had 'consumed a whole night in lying, looking to his great toe, about which he hath seen Tartars and Turks, Romans and Carthaginians, fight in his imagination.' The battle of the pigmies and cranes, and the wars of the Lilliputians, were nothing to this brave fantasy! The following is a touching and poetical instance of aberration:—

'When the king came in England [1603], at that time the pest was in London; he (Jonson) being in the country at Sir Robert Cotton's house with old Camden, he saw in a vision his eldest son, then a child, and at London, appear unto him with the mark of a bloody cross on his forehead, as if it had been cutted with a sword, at which amazed, he prayed unto God, and in the morning he came to Mr Camden's chamber to tell him, who persuaded him it was but an apprehension of his fantasy, at which he should not be dejected. In the meantime comes there letters from his wife of the death of that boy in the plague. He appeared to him, he said, of a manly shape, and *of that growth that he thinks he shall be at the resurrection.*'

Jonson honoured his boy's memory with some tender verses—

> Seven years thou wert lent to me, and I thee pay,
> Exacted by thy fate, on the just day.
> Oh, could I lose all father now! for why
> Will man lament the state he should envy?
> To have so soon 'scaped world's and flesh's rage,
> *And, if no other misery, yet age!*
> Rest in soft peace, and asked, say here doth lie
> Ben Jonson his best piece of poetry:
> For whose sake henceforth all his vows be such
> As what he loves may never like too much.

More touching and beautiful, however, is an effusion on the death of his first daughter, an infant. Mr Peter Cunningham has found an entry in the register of St Martin's-in-the-Fields (Jonson's parish in his early days), which seems to record the death of this child in 1593. Jonson was then only in his twentieth year.

but his youthful marriage and paternity are undoubted—

> Here lies, to each her parents' ruth,
> Mary, the daughter of their youth;
> Yet all heaven's gifts being heaven's due,
> It makes the father less to rue.
> At six months' end she parted hence,
> With safety of her innocence.
> Her soul heaven's queen, whose name she bears,
> In comfort of her mother's tears,
> Hath placed among her virgin train,
> Where, while that severed doth remain,
> The grave partakes the fleshly birth,
> Which cover lightly, gentle earth!

This tenderness of the rough, hard-living poet—'surly Ben'—is inexpressibly touching. His heart was in its right place. 'Of all styles,' says Drummond, 'he loved most to be named *honest*, and hath a hundred letters so naming him.' He merited the manly appellation which he coveted. Jonson's over-conviviality, however, accompanied with generally improvident habits, involved him in many difficulties, from which Shakspeare's better fortune and prudence seem to have kept him free. He trusted largely to the patronage of the court and the nobility, and was an unscrupulous adulator. The Earl of Pembroke, he said, allowed him L.20 every year to buy books—a delicate and refined mode of administering assistance. But Jonson had embalmed the memory of the earl's mother in that imperishable epitaph—

> Underneath this sable hearse
> Lies the subject of all verse,
> Sidney's sister, Pembroke's mother;
> Death, ere thou hast slain another,
> Learned, and fair, and good as she,
> Time shall throw a dart at thee.

The Earl of Dorset was also among Jonson's patrons, and he enjoyed the confidence and help of Bacon and Raleigh. The wits of the Mermaid Club were all his fast friends. Pecuniary independence seems never to have been dreamt of by the poets of those days. The only shame was in getting too little, not too much. Jonson vaunted loudly of his spirit and boldness in attacking the vices of the age, and the worthless tribe of sycophants and poetasters; yet he seems to have flattered the nobility all round, and to have half lived on his patrons.

It is pleasant to find that, after his plays and gorgeous masques had lost their attractions, and disease had cramped his energies, many of the aristocracy remembered their ancient poet, and relieved his necessities. Charles I. at one time sent him a present of L.100, and converted his laureate's salary of a hundred merks into pounds, adding at the same time a tierce of Canary wine, the poet's favourite beverage. The Earl of Newcastle appears to have been one of his most attentive and generous patrons; and Mr Peter Cunningham has contributed to the Shakspeare Society a most lively and ingenious begging letter addressed by Jonson to this nobleman. The original is among the Harleian manuscripts in the British Museum—

'My Noble and Most Honoured Lord—I myself being no substance, am fain to trouble you with shadows, or, what is less, an apologue or fable in a dream. I being strucken with the palsy in the year 1628, had by Sir Thomas Badger some few months since a fox sent me for a present, which creature, by handling, I endeavoured to make tame, as well for the abating of my disease, as the delight I took in speculation of his nature. It happened this present year, 1631, and this very week, being the week ushering Christmas, and this Tuesday morning in a dream (and morning dreams are truest), to have one of my servants come up to my bedside and tell me—"Master, master, the fox speaks!" Whereat methought I started, and troubled, went down into the yard to witness the wonder. There I found my Reynard in his tenement, the tub I hired for him, cynically expressing his own lot, to be condemned to the house of a poet, where nothing was to be seen but the bare walls, and not anything heard but the noise of a saw dividing billets all the week long, more to keep the family in exercise than to comfort any person there with fire, save the paralytic master: and went on in this way, as the fox seemed the better fabler of the two. I, his master, began to give him good words, and stroke him; but Reynard, barking, told me these would not do; I must give him meat. I, angry, called him stinking vermin. He replied, "Look into your cellar, which is your larder too, you'll find a worse vermin there." When presently calling for a light, methought I went down, and found all the floor turned up, as if a colony of moles had been there, or an army of saltpetre men. Whereupon I sent presently into Tuttle Street for the king's most excellent mole-catcher, to relieve me, and hunt them. But he, when he came, and had viewed the place, and had well marked the earth turned up, took a handful, smelt it, and said, "Master, it is not in my power to destroy this vermin; the king or some good man of a noble nature must help you. This kind of mole is called a *Want*, which will destroy you and your family, if you prevent not the working of it in time. And therefore God keep you, and send you health." The interpretation both of the fable and dream is, that I, waking, do find *Want* the worst and most working vermin in a house, and therefore, my noble lord, and next the king my best patron, I am necessitated to tell it you. I am not so impudent to borrow any sum of your lordship, for I have no faculty to pay; but my needs are such, and so urging, as I do beg what your bounty can give me, in the name of good letters, and the bond of an ever grateful and acknowledging servant. To your honour. Ben Jonson.

Westminster, 20*th December* 1631.'

The earl could hardly have resisted so interesting yet direct an appeal to his benevolence. Up to the period of his death, the poet had occasional glimpses of prosperity and joyousness. That excellent letter-writer, Howell, describes, under the date of 1636, a 'solemn supper' at Ben's house, at which he was a guest. The host was rather talkative and egotistical, according to Howell, but there was good company, excellent cheer, choice wines, and jovial welcome. This must have been on quarter-day! Jonson died in the following year, August 6, 1637.

Jonson was the most learned of all the poets of this brilliant era. His life and habits seem to have been very unsuitable for severe and continuous study; and it is certain he had not (though the contrary is often asserted) the benefit of a university education. The energy of his character, and his ambition for scholastic distinction, seem to have overcome all obstacles. He 'took the wall' of Shakspeare and all his fellow players and dramatists; he was the schoolmaster of the tribe, and in his latter days he ruled despotically. His classical studies are seen in their fairest light in his masques, and the exquisite lyrical poems scattered throughout his plays, with other minor pieces, which are rich in conception, and highly polished. His latest production, the pastoral drama called the Sad Shepherd, is also extremely poetical in subject and imagery. The comedies of Jonson are rarely pleasing, but are invaluable for their pictures of London and English life, their satire, admirable delineation of character, and the artful construction of the fable or plot. The conception of such characters as Kitely and Captain Bobadil by a youth of two-and-twenty, is a remarkable fact, and shows a sort of innate aptitude for comedy. There are passages of insufferable coarseness and pedantry even in the best of his plays; but their defects are redeemed by ready wit and broad humour, shrewd observation and sterling sense. His English vocabulary seems to have been inexhaustible. His style, so original in phrase and construction, flows on like a flood stained with impurities and exotic substances, yet ever sweeping, rattling on—a voluble and irresistible torrent. His satire and declamation have the same directness and energy. With what Juvenalian relish and eagerness he holds up some vice or folly to ridicule and detestation! How forcibly he depicts the miser, the epicure, the coxcomb, coward,

or bully! His tragedies, on the other hand, are cold, stiff, and formal. In these his learning, or rather his pedantry, overlaid his fancy. Shakspeare he once accused of 'wanting art.' In his own Roman plays we see little else but art—patient digging in the mines of classic story. In Shakspeare, art was incorporated with and lost in the midst of his creative originality. He had the essence and spirit, Jonson the language and facts, of classic antiquity.

> One but preserved the ashes: HE the flame,
> True to its sense, but truer to its fame.

SAVINGS' BANKS.

An article on this subject from the pen, we understand, of Dr Chalmers, appeared in a recent number of the North British Review. In this article there are many considerations—urged with all the author's accustomed force—to which the friends of the working-classes ought to join in giving publicity.

It appears that of late certain parties, possessed of great power over public opinion, have been trying to write down Savings' Banks. The arguments by which they seek to cast discredit upon these institutions, may be learnt from the following extract, quoted by Dr Chalmers from one of their articles on the subject. 'Take,' say the parties referred to, 'an extraordinary example. A labourer, sixty years of age, by hook or by crook has saved L.500. We know such a case. The L.500 is the plague of his life. It would be a mercy to swindle him out of it, except that he would probably fret a good deal at the loss. Could he forget it, he would be both a happier and a better man. To begin with, it is a guilty possession. His father is maintained by a distant Union; his sons and daughters are all but forbidden his cottage. He invests it in secret. It was lent at five per cent. to a gentleman engaged in the expensive amusement of overbuilding himself. The gentleman righted, and repaid the loan. So there was the labourer going about in the dusk of the evening looking for some needy yet trustworthy person to give him five per cent., or four-and-a-half, or four. At last he was forced to put it in the funds, where it now lies; but before he did this, he had offered it to a neighbour, whose death might have cost him every farthing, but who was honest enough to decline it on that account. He wishes to take a small farm, suited to his capital, but cannot hear of one. If, however, he were so fortunate, it is evident what would soon become of a farmer who, up to the age of sixty, had never occupied an acre of land, never owned a horse or a cow, or a single agricultural implement, except his spade, his hoe, and his pick-axe. A bad farmer, of course he would also be a bad emigrant. This L.500, then, is a burden of which the owner will only be relieved when he throws it on the ground. When he dies, his children, without estate, occupation, or husbandry, will squander it, not in dissipation, but in the mere feebleness and incontinence of ingrained poverty.

'A domestic servant, at the age of fifty-five or sixty, finds that she is incapable of further service, or, what amounts to the same thing, that people prefer younger servants. She has saved L.80. Very creditable in her, of course, and very stingy she must have been to her nephews and nieces to do so much. But what is she to do with her L.80? If she can make up her mind to part with the principal—and it is a very pardonable tenacity which prevents her from doing so—she could purchase L.8 a-year, or 3s. a-week. This is a shilling a-week for food and clothing, after lodging and fuel have been paid for. While she is looking about for a use to put it to, she lives on it, and it wastes away. All her relations are in the labouring class. There is not one of them who, in return for her little capital, or in the hope of its reversion, can offer her a domestic asylum where she will be useful and respected. Such a sum would insure her the title of Madame to the end of her days across the Channel, and quite set up her peasant brother and nephews. It would be a mine of agricultural wealth. On this side the Channel it would be a snowball in the sun.'

Now, though we can hardly conceive a person setting himself seriously to prove that the habit of saving ought to be discouraged among the working-classes, still it is evident that the effect of such clever and witty paragraphs as the above, is to spread the idea, that in England it is useless for people in the humbler ranks of life to save money. Supposing the sentiments which the writer expresses to become general among the classes whose case he is considering, what would be the results? The labourer would say to himself, 'By working hard, and living frugally, as I am doing now, I should be able, by the time I am sixty years of age, to have L.500 of my own. But what will be the use of it? In this country there is no way of safely and profitably investing so small a sum as L.500. In all probability I could not obtain a farm suited to such a capital; and even if I could, what sort of a farmer should *I* make, who never owned an acre of land? There is the same objection to my emigrating. In short, I should be obliged to lend the money privately; and then I should be in a continual state of alarm lest I should lose it. In France I could have found many ways of turning it to account, but here it would be the plague of my life; and when I was dead, all my relations would scramble for it over my corpse. It is best, therefore, not to save at all, to spend as I go, trusting to chance and the Union for my old age.' In a similar manner the domestic servant would reason. 'I am in a fair way,' she would say, 'to have L.80 of savings when I give up service. But what is L.80? If I were to part with the money, I might obtain three shillings a-week for it all the rest of my life; but how could I live upon that? I have no relations who could give me bed and board in exchange for my L.80. What a pity I was not born in France, where, they tell me, L.80 would secure me the title of Madame, and be quite a little fortune. Well, I shall give up saving; and when my nephew Jack comes to borrow other two sovereigns, I shall just let him have them, though I know, good-hearted fellow, he spent the last two I gave him at Greenwich fair.'

Of course such a pernicious way of thinking is not likely ever to be professed in the broad terms we have supposed. Whatever be the *conduct* of the working-classes in the matter, it will take a great deal of arguing to convince them that the habit of saving is a bad thing. The habit is so recommended by the universal experience of mankind, and is so rooted in the better parts of our nature, that it can fall into disrepute only in a very deteriorated condition of society. The question, therefore, whether it be advantageous for the working-classes of England to save money, might be safely treated as a mere scientific speculation with which the economists were amusing themselves, were it not that experience shows that there is not a more effectual way of perpetuating vicious practices in society, than by giving them the shelter of a theory. So infallible is the connexion between speculation and practice, that if the united gin-shops of England were to pay a staff of lecturers to go about disseminating the notion, that it is useless for the humbler classes to become capitalists, we are confident the result would be an immense increase of the number of gallons of spirits drunk within the year. It is therefore incumbent on sound economists not to suffer such a notion, however abstractly stated, to go abroad, without sending out its refutation after it; and this is what Dr Chalmers has done in his article on Savings' Banks.

The great fallacy, he says, of the reasoning of those who would cast discredit on the habit of saving among the humbler classes, is, that they talk as if the only use of money were to make more money. There is a limit, they say, to the increase of capital in a country; more money may be saved by a nation than it can

had employment for. Small capitalists, especially, have little chance of being able to find a profitable investment for their money. Except in times of inordinate speculation, as, for instance, during a railway mania, there is scarcely ever an opportunity for a man with but a small sum of money by him to make a lucky hit. While the nabob with his L.20,000 or L.30,000 can find ways of employing his money which will yield him a good interest, the thrifty labourer or artisan with his L.200 or L.300 will in most cases be obliged to remain a labourer or artisan all his life, because he can find no way of turning his little capital to account.

In answer to this, Dr Chalmers, admitting in the fullest manner the doctrine of the limited increase of capital, observes, 'Our purpose in these accumulations is not that the poor man should thereby acquire something to trade with. Ours is a homelier aim; and, to express it in homely language, it is simply that he should lay by for an evil day—for old age, which is the winter of life, or for those mishaps and sicknesses which might be termed its days of foul weather. Our chief anxiety and aim is, not to effectuate the movement of labourers and their families from the grade of society in which they are now placed to the one above it, but to elevate and improve their condition as labourers—to raise, in fact, the whole platform of humble life above the mire of its present degradation, so that there shall be no sunken storeys, inhabited at least by human beings, in our social edifice—a change which could, we believe, be accomplished without derangement or disturbance to those who occupy the upper apartments of the building, and without injury to the gracefulness or beauty of its higher elevations. Such being our main object, it is not profit at all that we should seek after; and would vastly rather that each depositor's little stock were kept in its place of safety, than put to hazard by the laying of it out on any speculation, however tempting. We even do not mind very particularly what the amount of interest is which the bank allows upon it, inasmuch that we should make no effort to raise the interest above the centage which is currently given. The principal design of the institution, and all its most valuable purposes, are served, if the money withheld from vicious or unnecessary expenditure at one period of life, is in reserve for needful subsistence or additional comfort at another period—even though during the latter period it should melt away like a snowball in the sun, and the last fragment or farthing of it should disappear with the final payment for the burial of him of whom it could be said at the termination of his honourable career, that his own hands ministered throughout to his own necessities, and to those who were with him.'

But besides this obvious use of the poor man's little accumulations in the Savings' Bank being a provision against times of distress from ill health or other causes, the reverend doctor contends that these Savings'-Bank deposits would have a wholesome effect on wages. 'A little stock,' he says, 'in the hands of labourers, would act both by an equalising and an elevating power on the wages of labour.'

To illustrate its effect in *equalising* wages, he instances 'those seasons of depression which so often take place in the trading world, when, by a glut in the market, wages are brought indefinitely low—and so a dreary season has to be traversed of under-paid and ill-paid industry—when, often for months together, workmen and their families have to live as they may in wretched starvation, or in wretched dependence on the allowances of a poors'-house. The peculiar misery,' he says, 'of such a condition is, that, to eke out a bare subsistence, the operatives are tempted to overwork, in order to compensate, by the amount of their work, for the deficiency of their wages. This we have frequently seen among the weavers in Glasgow, where, in those sad seasons of shaden markets and sunken wages, the practice was to keep the loom constantly agoing, so that it never rested all the four-and-twenty hours—the man and his wife sometimes taking their turns, and sharing the day's and night's work between them. Now, mark the effect of this dire and frantic necessity, and the sort of wretched cross-purpose in which it landed the unhappy parties, insomuch that the only result of this their strenuous and excessive labour, was both to prolong and to aggravate the mischief against which they were struggling with all their might, sorely but ineffectually—seeing that the woful predicament into which they are brought, is caused by the very glut which they are doing their uttermost to feed and to perpetuate.' They would be sending more cloth than usual into the market, at the very time when there was too much in it already. 'Now,' says Dr Chalmers, 'the best, the only extrication from such a calamity we can think of, were a little stock in the hands of labourers, who could therefore, on the resources which themselves had accumulated in good times, live for a season without labour, or at least without that grievously-excessive labour by which the weary interval of depression is so indefinitely lengthened out. It is thus that the period of bad times might be incalculably abridged, with a consumption quickened by low prices, and a production lessened by the voluntary abstinence of workmen, who could thus afford to relax or intermit their toils on every occasion of miserably low wages—till, on the happy conjunction of rising markets with cleared and empty warehouses, their work came to be eagerly sought after by competing capitalists, and its remuneration again ascended till it reached, or better still if it overpassed, the standard from which it had fallen.'

In order to make plain the power of Savings' Banks to *elevate* the wages of labour, Dr Chalmers has recourse to another Scottish illustration, drawn from 'the scene which is exhibited on the autumn mornings in the Grassmarket of Edinburgh, where shearers are in the habit of resorting to be hired for the work of the harvest. Let us just imagine,' he says, 'that each of these candidates for employment had a five-pound note in his pocket; or that, instead of living from hand to mouth, and being dependent on a master for his next meal, he had the means within himself for the comfortable subsistence of the next month or the next quarter of a year; on such a simple change in the state of our labourers, there would hinge a mighty difference in the result of this negotiation for wages. A higher wage would be brought about by the quiet operation of a market law—by a mere abatement of the necessity, and so of the keenness and competition for masters on the one side; and this of course followed up by an enhancement of the necessity, and so of the keenness and competition for workmen upon the other. We should not wonder if the calm and conscious possession by each labourer of his five-pound note, were eventually to raise the wages of each by a 6d. per day—a good interest out of doors for their accumulated treasure, and an abundant compensation for the smallness of the interest allowed by the bank, or of the interest within doors. Let our people only have saved enough to relieve them of the apprehension that, although refused the work they are seeking for, they will not on that account, for a good many days at least, go supperless to bed, and this would powerfully turn the balance in their favour. It is true,' he continues, 'that we can look for no general or sensible rise of wages from the operation of this cause, till Savings' Banks have been greatly more multiplied, and the habit of saving has been carried to a greater extent among the people. But why not make a right beginning in the matter; or rather, as the beginning has been already made, why not persevere and move on in the right direction?' Besides, it is not altogether true that the depositor in the Savings' Bank would have to wait till the habit of saving became general among his fellow-labourers, before he reaped the benefit of his own frugality in the shape of higher wages. The difference of the amount of wages given to one workman, and that given to another, is generally determined by the superiority of skill or character possessed by one of the workmen over the other. An eminent Spitalfields silk

manufacturer told Dr Chalmers that 'he made more of those well-conditioned and well-conducted workmen to whom he gave two guineas a-week, than he made of those misthriven, reckless, and dissipated characters to whom he gave half a guinea.' Now, the circumstance of a workman being a depositor in a Savings' Bank, would operate as a sort of certificate of character. It would be 'the guarantee of a sobriety and a moral superiority, which would make him all the more valuable to his employer; qualities these which are worthy of a price, and for which he often will be paid accordingly.'

Farther to illustrate the influence of Savings'-Bank deposits in raising wages, the doctor contrasts it with the opposite influence of debts. 'We have often heard,' he says, 'of an oppressive and unprincipled master, under the infamous truck system, who tempted his servants to expend beyond their wages, that he might become the dictator of his own terms with them when he had thus got them into his power.'

It would be well if these healthy considerations were disseminated, so as to become general among the working-classes. Assuredly, the habit of saving is not yet so overgrown a virtue among the English artisans, that it requires to be written down or even repressed. On the contrary, all the best and most enlightened friends of the working-classes, all who believe that the only effectual way to improve them is to stimulate them to self-improvement, and assist them in it, all such will join in desiring the prosperity and multiplication of those admirable institutions—Savings' Banks.

ADVENTURES IN THE PACIFIC.

Adventure has always its charms, be it by flood or field, at home or abroad, but more especially when it lies amid scenes little known, or even before unvisited. Under this impression we turn to a recent volume* by the surgeon of a whaling vessel, who traversed the Pacific some ten or twelve years ago, dating his departure from England in 1832, and his return in 1836. The lapse between the date of the incidents and that of their publication is an unusual circumstance; but perhaps the author, acting on the good old Horatian maxim, judged that his manuscript would not be the worse for the retention. Be this as it may, the 'Adventures' constitute a not uninteresting volume, relating as they do chiefly to shooting, fishing, and sailing excursions, and to exploring rambles on some of the uninhabited islands of Polynesia.

In October 1832 Dr Coulter set sail from Spithead in the good ship 'Stratford,' and, after a somewhat stormy run, entered the tropics, touched at Brava, one of the Cape de Verds, and at the Falklands. These last mentioned islands are, in Southern Atlantic conversation, called the 'egg market,' from the immense quantities of eggs of geese, penguins, and albatrosses, found along their shores. The nests of these birds are so numerous as to constitute ranges of two or three miles in length, and from three to six feet apart. 'This arrangement,' says our author 'is very convenient in every respect. The birds can easily hold a conversation across this street; and the sailors can walk up the centre of it, beat them out of their nests, and march off with the good eggs, thoughtfully leaving behind two or three bad ones as an inducement for the birds to return to their homes after the invasion.' From these long streets of birds'-nests, the ship's company carried off some six or seven tons of good palatable provision.

Having left the Falkland Islands, and rounded Cape Horn, the Stratford entered upon the scene of her whaling operations, and had good and easy success, if we may judge from some of the hunts described by Dr Coulter. Dismissing, however, these marine adventures, we shall follow him in his excursions on the islands which were visited during the cruise. Juan Fernandez —the island of the immortal Robinson Crusoe—was that first touched at, the vessel anchoring on the north side in deep water close to the beach. The island when they arrived was tenantless, though some time before the Chilian government had attempted to make it a sort of penal settlement. The attempt was unsuccessful; the convicts, amounting to about one thousand, rose on the soldiers in charge of them, seized their arms, and compelled two vessels, which were in the anchorage at the time, to carry them to the mainland.* A more enchanting habitation, if we may judge from Dr Coulter's description, could not be wished for either by citizen or convict. It is from sixteen to eighteen miles long, and about seven in width, and chiefly consists of a succession of small hills and valleys, each with its little stream; and those rivulets often uniting, came dashing over the cliffs in romantic waterfalls. After leaving the beach of Cumberland Bay, there is a level tract of some thirty acres filled with rose bushes in full bloom, with immense beds of mint, which is so tall, that one could hide in it without being discovered. The fragrance of this valley was enchanting. The small hills surrounding it, thickly covered with middling-sized timber in rich foliage, and a small rippling stream running through it, all added to its beauty. The island was abundantly stocked with bullocks, goats, and dogs —all imports since the time of Crusoe—but so wild, that when disturbed they dashed through the thickets like deer. There was also no want of fish, as the sea all around abounded with delicious rock-cod; and seals could be had in almost any quantity. Having replenished their stock of beef, fish, wood, water, &c. and having stowed away a few boat-loads of the mint, which formed an agreeable anti-scorbutic tea, the Stratford hoisted anchor, and bade adieu to this delightful and ever-memorable island.

The solitary life of Robinson Crusoe, or, more correctly speaking, Alexander Selkirk, appears to be anything but singular in the annals of the Pacific. This great and generally placid ocean is dotted over with hundreds of islands, the larger of which, in groups, are inhabited by tribes of people described by Cook and other voyagers, but the smaller and more isolated are lying in a state of nature, and untenanted, at least by natives. 'There is scarcely, however,' says our adventurer, 'an uninhabited island in those seas, in the thoroughfare of shipping, on which there is a fertile spot of earth with a supply of water, that has not its Robinson Crusoe on it.' Islands so occupied become in some measure shops to passing vessels; they furnish them with fresh vegetables and water, and likewise can give some information regarding the route of ships which had lately visited them. Dr Coulter mentions the case of an Irishman who, put ashore for bad behaviour from a vessel on Charles's Island, lived there some years a roving and independent life: he was at last killed in attempting to carry off from Guyaquil a queen for his beautiful domain. Another solitary of a different character was Johan Johonson, a Swede, who, somewhat later, lived a quiet life on this island, cultivating the ground, rearing goats, catching turtles, and otherwise occupying himself. This worthy man was ultimately robbed of his hard-earned property, including his boat, by a band of villains to whom he had shown kindness. 'There is an inducement,' says our author, 'to live on such islands; and that is the sale of their produce to seamen, who are very glad to get a supply of fresh vegetables, and even give cash for it. Then, again, the great feeling of ease of mind and independence—no one to control a man, no one to demand anything of him. The only real annoyance those isolated men meet with is the occasional runaway sailor, who hides in the bush until the ship sails, and then asks shelter

* By John Coulter, M. D. Dublin: Curry and Co. 1845.

* The island has since been taken on lease from the Chilian government by an American, who has brought to it a small colony of Tahitians, with the intention of cultivating it, so as to make it become the resort of whalers and other vessels navigating the Pacific.

from the monarch of the island, and perhaps afterwards ill-treats or otherwise annoys him.'

After some weeks' whaling, the Stratford anchored at Chatham island, another of the Gallapagos group, for the purpose of recoopering her oil, and otherwise righting her cargo. A tent having been erected on a smooth grassy plot close to the water's edge, one-half of the crew took their turn of the land and vessel alternately; and a most delightful residence they had. 'Fine green turtle came in on the beach at night, and, with a little row and fun in watching for and turning them, were easily taken; then the wild ducks on the lagoons, and plenty of large doves on the land, were easily knocked down by a man throwing a stick among them; the terrapin, or elephant tortoise, of from two to four hundred pounds weight; plenty of fine fish close to the rocks; whole beds of very high strong mint, with other herbs in great variety; all those, with many others, afforded the men a great treat, particularly when taken by themselves and used on shore. There were plenty of large hair seals in all directions on the beaches and rocks, whose skins made mocassins for every one in the ship; and, to complete the comforts of this encampment, fine fresh water was obtained by digging down about fourteen feet. All round this end of the island the woods extended to nearly the beach and rocks, and in some instances overhung the water. It was a rich sight. I had been at this island twice before, but had not an opportunity of seeing so much of it; indeed little more than the rocks, beach, and a mile or so inland. As we were to lie here some time, and as there was nothing for me to do professionally, I determined to shoulder my gun, and walk right round the island on an exploring excursion.' Having arrayed himself in leathern cap and jacket, canvas trousers and strong shoes, and carrying with him the indispensable accoutrements of knife, axe, gun, and canteen, the doctor set out alone; not an individual would volunteer his companionship; it 'was all a humbug,' said they, 'to be tramping about an uninhabited island from morning to night.' For a week or two our adventurer found everything very pleasant—delightful scenery, good living, and no charges; nothing to do but travel, cook his own turtle and venison, and sleep soundly without dread or danger. His stipulated time being nearly expired, he again bent his way through brake and ravine to the encampment; but mark his dismay when he found the tent and vessel gone—not a trace of his companions save a pole stuck in the ground, and a bottle dangling at the top of it. This, however, contained a note from the captain, stating that the vessel had broken from her moorings, and that, in consequence of the current and swell, he was obliged to run her to sea; but that he would bring her up to her old berth as soon as the storm abated. Here then was our adventurer an involuntary Robinson Crusoe on one of the Gallapagos; set adrift for days, it might be for weeks, and left to his own resources, with the exception of a change of clothing, some shot and powder, a small bag of biscuit, and a frying-pan which the captain had considerately deposited near the deserted encampment. There was no use for idle regret: wishes could not better his position; and so arraying himself in his new apparel, Dr Coulter set out once more to lead the life of a solitary hunter and fisher. The account of one of his adventurous rambles possesses much pathetic interest.

'When I was better than half way down the weather side, at about four miles inland, I came suddenly on a space of ground, which was partially clear, and where a few trees lay that had evidently a few years ago been cut down by some one. On further entering this space, there were mustard pumpkins, melons, Indian corn, sweet potatoes, and tobacco, all growing indiscriminately, and in a very wild state—tall weeds, and suckers of young trees, starting up here and there from the roots of the old ones.

'In looking about, I saw what was once a spade, but the blade of which now was only rust, and fell in pieces when I touched it with my foot. Near this, in a hollow, was a well with water enough, but overgrown and covered with weeds. It was regularly built round with stone. I continued my search over this once well-cared for plantation, until I came to the highest or upper part of the clearing, which was walled along for several hundred yards by solid rock. Up near this, almost concealed by a clump of trees, and nearly overgrown with wild vine, I discovered a house, or rather hut, on a comfortable scale. There was no sound of human voice here—all was still.

'I knew, from the indications about, that it was long since the place had been attended to. The net-work of vines round it was so thick and close, that I had to make an opening through it with my axe. On entering this wild barrier, I came at once on the house, which was built against the rock, with a shed roof thatched—the sides and front merely posts of wood, interlaced by vine branches, and covered over with mud. The whole was in a falling state; there was only a doorway into it, but no door.

'I now with strange feelings entered the door; there was ample light through this ruin to see all. It was a melancholy sight and discovery to me. In the centre of the floor, near a rude table, lay the skeleton of a man, only partially concealed by what had once been a covering of skins. On my touching it, it fell into powder; the bones, though in apposition, were separated by the slightest touch. On one side were an old boiling pot and frying-pan, wood, axe, &c. all in rust; a tobacco-box, with a rudely manufactured pipe, on the table; an old worn-out and rust-eaten carabine and cutlass in the corner: there was a shelf which had once served for a bed, with seal-skins on it. I searched minutely, but could not find either paper or any other thing that could give the least information as to the name, or who this unfortunate recluse was.

'It was a dismal scene. I came out and gazed on this hut for some time; a thought struck me, and I proceeded to execute it. All was a ruin, and now falling; the only thing I could now do for this remnant of humanity was to bury it; the only way I could even do that was to cover it with the ruins. A few blows of a heavy stone against the posts laid all prostrate, and shut out the sight for ever.

'Whilst in those seas I made many inquiries, from captains and others frequenting those islands, about this solitary man, but no one knew or had heard anything about him. He must have been dead for many years, from the state of the skeleton, the hut, and long-neglected plantations. I left the grounds without touching anything, with a heavy heart, and could not eat a bit until I was miles away from it.'

After a lapse of fourteen days, the Stratford hove in sight; and a couple of boats were lowered at the signal of the doctor, who admits that though he always experienced great delight in a change of scenery, and exploring unknown places, he felt infinitely more in again hearing the voices of his friendly shipmates. The voyage was now directed towards the Marquesas, a group of islands whose inhabitants were then thorough barbarians and cannibals. On one of these the doctor was again accidentally left, and was obliged to remain for some time, and cultivate the acquaintance of the natives. In a few days he became a great favourite with the chief of the tribe, who, being at war with another tribe, thought the adventurer's rifle more than match for a thousand of the spears of his opponents. The doctor in short became a great man—too great we fear for his own liking or comfort; for they not only made him a chief, but insisted on his being tattooed, and made 'one of themselves.' 'I was,' continues he, 'four hours under the operator the first day, and three hours the second; which time sufficed to mark on my skin the delineations and characteristics of a chief. After all was over, the surface was rubbed with scented cocoa-nut oil, which cooled the inflammation much, and gave me great ease. Then, blowing

conchs and firing muskets ended the ceremony. The people and chiefs all then looked upon me as more than one of themselves. They came in numbers, bringing what they thought delicacies of all sorts—fruit, fowl, pig, fish, &c.; and the chiefs gave me various presents. Indeed all was an exhibition of real kindness.' Besides causing him to be tattooed, his adopters insisted on our member of the College of Physicians changing his own respectable habiliments for the less cumbersome costume of the country. '"Mate" [one of the chiefs] gave me his own head-dress, which he had worn in fifteen battles. It fitted me exactly, and was a splendid thing. There was a hoop of brown bark, about three inches deep, to fit on the head; this was encircled with pearl-shell of various shapes, and red berries glued fast on; from the entire circumference of the top, drooped gracefully over the shoulders the long shining feathers of the cock's tail; the inside was lined, and the lower edge fringed, with the varied-coloured bright feathers of the ground-parrot. As soon as he put it on my head, and adjusted it, he took me to a Marquesan looking-glass (a deep pond of clear water) to look at myself; and from what I beheld then, I certainly thought my friends at home would scarcely know me.' Nor did the change end in the dress; they made him alter his profession, turned the physician into a warrior, and compelled him to take part in the pending encounter. The account of that savage affair is the most unpleasing portion of the volume, and we gladly pass it over. The object of the war, we are told, was satisfactorily attained, by the restoration of the mother and child of the chief, both having been stolen in order to be made a sacrifice in one of the heathenish rites common in these islands. A short time afterwards, the Stratford appeared once more in sight, and our author left the island, and gained the ship; his grotesque appearance being greeted 'with the most tremendous and unrestrained laughter.'

Cruising for whales again occupied the Stratford for several weeks, after which she touched at Robert's Island, the most northern of the Marquesas. This islet, according to the doctor's description, is quite a gem of a place—secure, and well stocked with every sort of Polynesian produce. And who, it may be asked, were the lords of so desirable a domain? Why, another Robinson Crusoe in the person of Thomas Holt, an English sailor, who had left an American brig, on board of which he had met with some unfriendly treatment. Here he had already lived five years; three by himself, and two in company with another English sailor and a native Marquesan boy. The little group seemed perfectly happy; and so many will think they ought to have been, for, under a most delightful climate, they had plenty of hogs, fowls, fruit, fish, and turtle—everything, in short, which they desired; and the whole seasoned with the most perfect freedom and independence. The doctor's description of a visit to the palace of these island monarchs is quite a picture:—'Our way lay through a delightfully picturesque and natural avenue of bread-fruit, cocoa-nut, and other trees, with here and there a high naked rock of very fantastic form. The weather was very fine, the temperature of the air agreeable, and the vegetation around was fresh and luxuriant. The chirp of the paroquette, and the occasional note of other birds, added life to the scene.

'After walking through this for about a mile and a half, we came to a very densely wooded part, and by taking a scarcely defined footpath through this for a few moments, we arrived at an open space, from which the trees had been cleared away, leaving the stumps about two or three feet high. At one end of this clearing, and close to a small pond of fresh-water, Holt's house stood. In the rear of this habitation was a complete barrier of thick timber, which had not been touched. The house itself was about twenty feet long by twelve wide, sufficiently capacious for the residence of the two men and the boy that formed the only inhabitants of this island. At one end of it there was a kind of cook-house erected, where they prepared their meals. The furniture of the house consisted of two sleeping places for the men, and a smaller one for the boy, built up against the side of the house, after the manner of a ship's berth; two muskets, and a couple of Marquesan spears. Fishing-gear hung against the wooden partition, the house being divided into two apartments. Two frying-pans, and an iron boiling-pot, with three large calabashes slung for carrying water, and five or six canoe paddles lying in the corner; a kind of a table was in the centre of the larger room, rudely enough made, by driving four posts into the floor, and resting on them a slab of wood, roughly flattened with an axe. They had also two spades and as many axes; pieces of hollowed wood served them for plates and dishes.'

After leaving the Marquesas, the Stratford touched at the Georgian and Society Islands, and ultimately at Tahiti—Pomare's own isle—to which recent events have now attracted the attention of Europe. To these our author alludes but slightly—conveying, however, the gratifying information that all of them present unmistakeable evidence of improvement both in economy and morals. While at Tahiti, the doctor was presented to no less a personage than Queen Pomare, and was nearly getting into a more serious adventure than any into which accident had yet thrown him. This was nothing short of marriage with one of the queen's maids of honour—her majesty vehemently urging the affair, and promising our M.D. an ample bribe in the shape of land and oxen. 'Not being inclined at the time,' says the doctor naïvely, 'I waived all those brilliant inducements, and begged to decline so great a favour, even from the hands of her majesty.'

Here the adventures end somewhat abruptly, but with a promise that the author will, in a future work, bring the reader across the meridian of 180 degrees into east longitude, and tell him of adventures and occurrences at islands and other places where a civilised trader seldom, and a missionary never landed.

MR DICKENS'S NEW CHRISTMAS TALE.*

We are happy to find that Mr Dickens, in his annual volume for the present year, has left the question of social wrongs and rights to the discussion of those who can consider them in a calmer and less partial spirit, and turned his attention to a subject of purely moral interest, more within the scope of his powers, and better suited to his habits of thought and feeling. The title of his new book indicates a theme of the domestic kind, embellished with fancy. The contents justify the anticipation thus raised. It is a picture of humble life, contemplated in its poetic aspects, and at its more romantic crises; and shows its author, in one sense, ambitious of becoming the Wordsworth of prose fiction. Deficient in the profundity and stern power of that great master, the novelist yet has some requisites which the poet wants—a certain wit and humour, and, above all, an experience of civic life, that the bard of Rydal has failed to cultivate. Moreover, Mr Dickens succeeds quite as much by tact as genius.

The story to which we are introduced by 'The Cricket on the Hearth,' has, however, not benefited much by such experience, though it has greatly by the tact. In its elements it is trite, commonplace, and simple; there is but one *new* character in it, Tilly Slowboy, a girl from the Foundling, employed as nursemaid to the carrier's wife, Mrs Peerybingle, the heroine of the tale: a small part in the eccentric line of farce-writing, which is conceived with equal humour and truth, but occupies only a trifling space in the background of the composition. The other characters consist of a middle-aged carrier, a man of slow intellect but warm heart, who has married a young, gay, little,

* The Cricket on the Hearth, a Fairy Tale of Home. By Charles Dickens. London: Bradbury and Evans. 1846.

chubby sort of woman, whom in his happier moments he calls 'Dot,' on account of her diminutive appearance—a toymaker and a toy-merchant, both dealers in fancy articles, and having their own fancies reacted on by their occupation—a sailor youth, who has disguised himself as a deaf old gentleman—a blind girl, his sister, and daughter of Caleb Plummer, the toymaker already mentioned—and May Fielding and her mother, a decayed gentlewoman, still tenacious of her gentility. These unpromising elements, however, are combined with so much skill and effect, as to impress us anew with an old conviction, that, in the hands of a true artist, there is nothing which may not be made interesting and pleasing. There is also no little delicacy of sentiment, situation, and character, involved in the treatment; and the whole is so evidently pervaded with a moral purpose, that it fails not to command at least the reader's respect. We feel, perhaps, this more than admiration for the talent displayed.

It will be convenient, before proceeding to extracts, to sketch an outline of the plot. Edward Plummer has returned, after many years' absence, from 'the golden South Americas,' but hears by the way that the girl, May Fielding, to whom formerly he was affianced, has long given him up for lost or dead, and is about to be married to Tackleton, the toy-merchant, for the sake of his wealth. Better to learn the true state of matters, he assumes the disguise before mentioned—packs himself into the carrier's van, installs himself in the carrier's house, and finally manages to get himself bedded and boarded there; in fact, he has contrived to let the little woman into his secret, who keeps it from her husband, as being the least likely of men to keep it from others. Circumstances at length become suspicious; and the attention of the good, honest carrier is directed to them by Tackleton, who is rather disposed to look on the 'ugly' than the handsome side of things, and who accordingly, as a toy-merchant, still patronised the hideous and demoniac in dolls, tumblers, Jack in the boxes, and giants, in preference to the beautiful and the amiable. The moral purpose of the book is contained in the results of these events: the jealous carrier shows himself both wiser and more merciful than Othello; and, in the end, his tempter a repentant Iago, with as little real malignity as could be desired.

In the working up of these simple materials, Mr Dickens invests with life and intelligence the inanimate as well as the living portion. He opens his story with describing the contest between the Kettle on the grate and the Cricket on the Hearth, and does this in a style of personification which, to say the least of it, is bold. The song of the Kettle he even gives in rhymed words, which, for the sake of a remark it suggests, we quote:

'That this song of the Kettle's was a song of invitation and welcome to somebody out of doors, to somebody at that moment coming on towards the snug small home and the crisp fire, there is no doubt whatever. Mrs Peerybingle knew it perfectly, as she sat musing before the hearth. It's a dark night, sang the Kettle, and the rotten leaves are lying by the way; and above all is mist and darkness, and below all is mire and clay; and there's only one relief in all the sad and murky air; and I don't know that it is one, for it's nothing but a glare of deep and angry crimson, where the sun and wind together set a brand upon the clouds for being guilty of such weather; and the widest open country is a long dull streak of black; and there's hoar-frost on the finger-post, and thaw upon the track; and the ice it isn't water, and the water isn't free; and you couldn't say that anything is what it ought to be; but he's coming, coming, coming!——

'And here, if you like, the Cricket DID chime in! with a chirrup, chirrup, chirrup of such magnitude, by way of chorus; with a voice so astoundingly disproportionate to its size, as compared with the Kettle (size! you couldn't see it!), that if it had then and there burst itself like an overcharged gun; if it had fallen a victim on the spot, and chirruped its little body into fifty pieces; it would have seemed a natural and inevitable consequence, for which it had expressly laboured.

'The Kettle had had the last of its solo performance. It persevered with undiminished ardour; but the Cricket took first fiddle, and kept it. Good Heaven, how it chirped! It's shrill, sharp, piercing voice resounded through the house, and seemed to twinkle in the outer darkness like a star. There was an indescribable little trill and tremble in it, at its loudest, which suggested its being carried off its legs, and made to leap again, by its own intense enthusiasm. Yet they went very well together, the Cricket and the Kettle. The burden of the song was still the same; and louder, louder, louder still they sang it in their emulation.'

Now, our readers will have perceived that this song of the Kettle, though written as verse, is printed as prose. This is a peculiarity in Mr Dickens's compositions which has not generally been perceived. It was, however, pointed out some time ago in 'The New Spirit of the Age;' and many passages adduced, written in blank verse, of irregular metres and rhythms, such as that employed by Southey and Shelley, in 'Thalaba' and 'Queen Mab.' The frequency of its occurrence indicates not only a design on the author's part to elevate his style by such means, but a poetic spirit in him, to which some kind of music is necessary as the natural utterance of its better thoughts. But the charm is a concealed charm; the varied harmony has still the look of uniform prose, and therefore steals unobserved into the reader's mind, who is pleased he knows not why. This is a little trick of style, which it is well, we think, to point out, particularly in such a work as the one under review, the merit of which is almost altogether dependent on style, and the poetic form of treatment which, with more or less success, is adopted.

This spirit and form of treatment is transparently manifest in the episode of the toymaker and his blind daughter. Here the writer has sought to exhibit, not without effect, the influence of art in its humblest form. From our first acquaintance with him, we discover his ruling passion. 'There is,' says he, 'rather a run on Noah's Arks at present. I could have wished to improve upon the family, but I don't see how it's to be done at the price. It would be a satisfaction to one's mind, to make it clearer which was Shems and Hams, and which was Wives. Flies an't on that scale neither, as compared with elephants, you know.' Such are the poor toymaker's truly artistic aspirations, justifying at once his relationship, though distant, with the Raphaels and the Michael Angelos. Another instance—'"You couldn't have the goodness to let me pinch Boxer's tail, mum, for half a moment, could you?"

"Why, Caleb, what a question!"

"Oh, never mind, mum," said the little man. "He mightn't like it, perhaps. There's a small order just come in for barking dogs; and I should wish to go as close to natur' as I could, for sixpence. That's all. Never mind, mum."'

'Caleb and his daughter were at work together in their usual working-room, which served them for their ordinary living room as well; and a strange place it was. There were houses in it, finished and unfinished, for dolls, of all stations in life. Suburban tenements for dolls of moderate means; kitchens and single apartments for dolls of the lower classes; capital town residences for dolls of high estate. Some of these establishments were already furnished according to estimate, with a view to the convenience of dolls of limited income; others could be fitted on the most expensive scale, at a moment's notice, from whole shelves of chairs and tables, sofas, bedsteads, and upholstery. The nobility and gentry and public in general, for whose accommodation these tenements were designed, lay, here and there, in baskets, staring straight up at the ceiling; but in denoting their degrees in society, and confining them to their respective stations (which experience shows to be lamentably difficult in real life), the makers of these dolls had far improved on nature, who is often froward

and perverse; for they, not resting on such arbitrary marks as satin, cotton-print, and bits of rag, had superadded striking personal differences which allowed of no mistake. Thus, the doll-lady of distinction had wax limbs of perfect symmetry; but only she and her compeers; the next grade in the social scale being made of leather; and the next of coarse linen stuff. As to the common people, they had just so many matches out of tinder-boxes for their arms and legs, and there they were—established in their sphere at once, beyond the possibility of getting out of it.

'There were various other samples of his handicraft besides dolls in Caleb Plummer's room. There were Noah's Arks, in which the birds and beasts were an uncommonly tight fit, I assure you; though they could be crammed in anyhow at the roof, and rattled and shaken into the smallest compass. By a bold poetical license, most of these Noah's Arks had knockers on the doors; inconsistent appendages, perhaps, as suggestive of morning callers and a postman, yet a pleasant finish to the outside of the building. There were scores of melancholy little carts, which, when the wheels went round, performed most doleful music. Many small fiddles, drums, and other instruments of torture; no end of cannon, shields, swords, spears, and guns. There were little tumblers in red breeches, incessantly swarming up high obstacles of red tape, and coming down head first upon the other side; and there were innumerable old gentlemen of respectable, not to say venerable appearance, insanely flying over horizontal pegs, inserted for the purpose in their own street doors. There were beasts of all sorts; horses, in particular, of every breed, from the spotted barrel on four pegs, with a small tippet for a mane, to the thoroughbred rocker on his highest mettle. As it would have been hard to count the dozens upon dozens of grotesque figures that were ever ready to commit all sorts of absurdities, on the turning of a handle, so it would have been no easy task to mention any human folly, vice, or weakness, that had not its type, immediate or remote, in Caleb Plummer's room. And not in an exaggerated form; for very little handles will move men and women to as strange performances as any toy was ever made to undertake.

'In the midst of all these objects, Caleb and his daughter sat at work. The blind girl busy as a doll's dressmaker, and Caleb painting and glazing the four-pair front of a desirable family mansion. * *

"So you were out in the rain last night, father, in your beautiful new greatcoat?" said Caleb's daughter.

"In my beautiful new greatcoat!" answered Caleb, glancing towards a clothes-line in the room, on which the garment [a miserable robe, made of the old covering of a goods' bale] was carefully hung up to dry.

"How glad I am you bought it, father!"

"And of such a tailor, too," said Caleb. "Quite a fashionable tailor. It's too good for me."

'The blind girl rested from her work, and laughed with delight. "Too good, father! What can be too good for you?"

"I'm half ashamed to wear it, though," said Caleb, watching the effect of what he said upon her brightening face; "upon my word. When I hear the boys and people say behind me, 'Halloa! here's a swell!' I don't know which way to look. And when the beggar wouldn't go away last night, and, when I said I was a very common man, said, 'No, your honour! Bless your honour, don't say that!' I was quite ashamed. I really felt as if I hadn't a right to wear it."

'Happy blind girl! How merry she was in her exultation!

"I see you, father," she said, clasping her hands, "as plainly as if I had the eyes I never want when you are with me. A blue coat——"

"Bright blue," said Caleb.

"Yes, yes! Bright blue," exclaimed the girl, turning up her radiant face; "the colour I can just remember in the blessed sky! You told me it was blue before! A bright blue coat——"

"Made loose to the figure," suggested Caleb.

"Yes, loose to the figure!" cried the blind girl laughing heartily; "and in it you, dear father, with your merry eye, your smiling face, your free step, and your dark hair, looking so young and handsome!"

"Halloa! halloa!" said Caleb. "I shall be vain presently."

I think you are already," cried the blind girl, pointing at him in her glee. "I know you, father! Ha, ha ha! I've found you out, you see!"

'How different the picture in her mind from Caleb as he sat observing her. She had spoken of his free step. She was right in that. For years and years he never once had crossed that threshold at his own slow pace, but with a footfall counterfeited for her ear; and never had he, when his heart was heaviest, forgotten the light tread that was to render hers so cheerful and courageous!

'Heaven knows! but I think Caleb's vague bewilderment of manner may have half originated in his having confused himself about himself and everything around him, for the love of his blind daughter. How could the little man be otherwise than bewildered, after labouring for so many years to destroy his own identity, and that of all the objects that had any bearing on it?'

This is a delicate conception, and executed with much tenderness of feeling. Poor Caleb! He has also deceived his daughter on another point nigher her heart. He has represented Tackleton to her as their guardian angel, not as their stern taskmaster, which he really was; and she, in her blindness, had indulged an affection for him, the strength of which his intended marriage with another was to show. All the characters of the story are assembled at a pic-nic party held once a fortnight at Caleb Plummer's: on such an occasion, the state of her feelings could be concealed no longer. The old man's consequent distress is pathetic. He is again on a visit to Mrs Peerybingle's.

'"Bertha, my dear!" said Caleb, "I have something on my mind I want to tell you, while we three are alone. Hear me kindly. I have a confession to make to you, my darling!"

"A confession, father?"

"I have wandered from the truth, and lost myself, my child," said Caleb, with a pitiable expression in his bewildered face. "I have wandered from the truth, intending to be kind to you, and have been cruel."

'She turned her wonder-stricken face towards him and repeated "Cruel!"

"He accuses himself too strongly, Bertha," said Dot. "You'll say so presently. You'll be the first to tell him so."

"He cruel to me!" cried Bertha, with a smile of incredulity.

"Not meaning it, my child," said Caleb. "But I have been, though I never suspected it till yesterday. My dear blind daughter, hear me, and forgive me! The world you live in, heart of mine, doesn't exist as I have represented it. The eyes you have trusted in have been false to you."

'She turned her wonder-stricken face towards him still; but drew back, and clung closer to her friend.

"Your road in life was rough, my poor one," said Caleb, "and I meant to smooth it for you. I have altered objects, changed the characters of people, invented many things that never have been, to make you happier. I have had concealments from you, put deceptions on you—God forgive me!—and surrounded you with fancies."

"But living people are not fancies?" she said hurriedly, and turning very pale, and still retiring from him. "You can't change them."

"The marriage that takes place to-day," said Caleb, "is with a stern, sordid, grinding man; a hard master to you and me, my dear, for many years; ugly in his looks, and in his nature; cold and callous always; unlike what I have painted him to you in everything, my child—in everything."

"Oh, why," cried the blind girl, tortured as it seemed almost beyond endurance—"why did you ever do this? Why did you ever fill my heart so full, and then come in like death, and tear away the objects of my love? Oh, Heaven, how blind I am! how helpless and alone!"

'Her afflicted father hung his head, and offered no reply but in his penitence and sorrow. * *

"Mary," said the blind girl, "tell me what my home is—what it truly is."

"It is a poor place, Bertha; very poor and bare indeed. The house will scarcely keep out wind and rain another winter: it is as roughly shielded from the weather, Bertha," Dot continued in a low clear voice, "as your poor father in his sackcloth coat."

'The blind girl, greatly agitated, rose, and led the carrier's little wife aside. * *

"Dear Mary, a moment—one moment—more this way; speak softly to me. You are true, I know. You'd not deceive me now, would you?"

'"No, Bertha, indeed."

"No, I am sure you would not; you have too much pity for me. Mary, look across the room to where we were just now; to where my father is—my father, so compassionate and loving to me—and tell me what you see."

"I see," said Dot, who understood her well, "an old man sitting in a chair, and leaning sorrowfully on the back, with his face resting on his hand, as if his child should comfort him, Bertha."

"Yes, yes; she will; go on."

"He is an old man, worn with care and work. He is a spare, dejected, thoughtful, gray-haired man. I see him now, despondent and bowed down, and striving against nothing; but, Bertha, I have seen him many times before, and striving hard in many ways for one great sacred object; and I honour his gray head, and bless him!"

'The blind girl broke away from her, and throwing herself upon her knees before him, took the gray head to her breast.'

This is exquisite sentiment. The mental anguish suffered by the jealous carrier is of a more painful character. For a while he indulges in thoughts of murdering the youth; he sits up all night in his chair before the fire in the greatest agony; and but for the Cricket on the Hearth, who treats him with fairy songs and fairy shapes, he would have been guilty of something desperate.

'Thus the night passed. The moon went down; the stars grew pale; the cold day broke; the sun rose; the carrier still sat, musing, in the chimney corner. He had sat there, with his head upon his hands, all night. All night the faithful Cricket had been chirp, chirp, chirping on the Hearth. All night he had listened to its voice. All night the household fairies had been busy with him.

'He rose up when it was broad day, and washed and dressed himself. He couldn't go about his customary cheerful avocations; he wanted spirit for them; but it mattered the less, that it was Tackleton's wedding-day, and he had arranged to make his rounds by proxy. He had thought to have gone merrily to church with Dot. But such plans were at an end. It was their own wedding-day too. Ah! how little he had looked for such a close to such a year!

'The carrier expected that Tackleton would pay him an early visit; and he was right. He had not walked to and fro before his own door many minutes, when he saw the toy-merchant coming in his chaise along the road. As the chaise drew nearer, he perceived that Tackleton was dressed out sprucely for his marriage, and had decorated his horse's head with flowers and favours.'

Shortly after this, it is discovered that the stranger has left his apartment *via* the window.

'"John Peerybingle," said Tackleton in his ear, "I hope there has been nothing—nothing rash in the night?"

'The carrier turned upon him quickly.

"Because he's gone!" said Tackleton; "and the window's open. I don't see any marks; to be sure it's almost on a level with the garden: but I was afraid there might have been some—some scuffle. Eh?"

'He nearly shut up the expressive eye altogether; he looked at him so hard. And he gave his eye, and his face, and his whole person, a sharp twist—as if he would have screwed the truth out of him.

"Make yourself easy," said the carrier. "He went into that room last night, without harm in word or deed from me; and no one has entered it since. He is away of his own free will. I'd go out gladly at that door, and beg my bread from house to house for life, if I could so change the past that he had never come. But he has come and gone; and I have done with him!"

"Oh; well, I think he has got off pretty easily," said Tackleton, taking a chair.

'The sneer was lost upon the carrier, who sat down too, and shaded his face with his hand, for some little time, before proceeding. "You showed me last night," he said at length, "my wife—my wife that I love: secretly——"

"And tenderly," insinuated Tackleton.

"Conniving at that man's disguise, and giving him opportunities of meeting her alone. I think there's no sight I wouldn't have rather seen than that. I think there's no man in the world I wouldn't have rather had to show it me."

"I confess to having had my suspicions always," said Tackleton. "And that has made me objectionable here, I know."

"But as you did show it me," pursued the carrier, not minding him, "and as you saw her—my wife—my wife that I love"—his voice, and eye, and hand, grew steadier and firmer as he repeated these words, evidently in pursuance of a steadfast purpose—"as you saw her at this disadvantage, it is right and just that you should also see with my eyes, and look into my breast, and know what my mind is upon the subject. For it's settled," said the carrier, regarding him attentively; "and nothing can shake it now."

'Tackleton muttered a few general words of assent, about its being necessary to vindicate something or other; but he was overawed by the manner of his companion. Plain and unpolished as it was, it had a something dignified and noble in it, which nothing but the soul of generous honour dwelling in the man could have imparted.

"I am a plain, rough man," pursued the carrier, "with very little to recommend me. I am not a clever man, as you very well know. I am not a young man. I loved my little Dot, because I had seen her grow up, from a child, in her father's house; because I knew how precious she was; because she had been my life for years and years. There's many men I can't compare with, who never could have loved my little Dot like me, I think!"

'He paused, and softly beat the ground a short time with his foot before resuming.

"I often thought that though I wasn't good enough for her, I should make her a kind husband, and perhaps know her value better than another; and in this way I reconciled it to myself, and came to think it might be possible that we should be married. And in the end it came about, and we were married."

"Ha!" said Tackleton, with a significant shake of his head.

"I had studied myself; I had had experience of myself; I knew how much I loved her, and how happy I should be," pursued the carrier. "But I had not—I feel it now—sufficiently considered her."

"To be sure," said Tackleton. "Giddiness, frivolity, fickleness, love of admiration! Not considered! All left out of sight! Ha!"

"You had best not interrupt me," said the carrier with some sternness, "till you understand me; and

you're wide of doing so. If, yesterday, I'd have struck that man down at a blow who dared to breathe a word against her, to-day I'd set my foot upon his face if he was my brother!"

'The toy-merchant gazed at him in astonishment. He went on in a softer tone—

"Did I consider," said the carrier, "that I took her, at her age, and with her beauty, from her young companions, and the many scenes of which she was the ornament, in which she was the brightest little star that ever shone, to shut her up from day to day in my dull house, and keep my tedious company? Did I consider how little suited I was to her sprightly humour, and how wearisome a plodding man like me must be to one of her quick spirit? Did I consider that it was no merit in me, or claim in me, that I loved her, when everybody must who knew her? Never. I took advantage of her hopeful nature and her cheerful disposition, and I married her. I wish I never had! For her sake—not for mine!"

'The toy-merchant gazed at him, without winking. Even the half-shut eye was open now.

"Heaven bless her!" said the carrier, "for the cheerful constancy with which she has tried to keep the knowledge of this from me! And Heaven help me, that, in my slow mind, I have not found it out before! Poor child! Poor Dot! *I* not to find it out, who have seen her eyes fill with tears when such a marriage as our own was spoken of! I, who have seen the secret trembling on her lips a hundred times, and never suspected it till last night! Poor girl! That I could ever hope she would be fond of me! That I could ever believe she was!" * *

"If that is your opinion——" Tackleton began.

"So let her go," pursued the carrier. "Go, with my blessing for the many happy hours she has given me, and my forgiveness for any pang she has caused me. Let her go, and have the peace of mind I wish her! She'll never hate me. She'll learn to like me better when I'm not a drag upon her, and she wears the chain I have rivetted more lightly. This is the day on which I took her, with so little thought for her enjoyment, from her home. To-day she shall return to it; and I will trouble her no more. Her father and mother will be here to-day—we had made a little plan for keeping it together—and they shall take her home. I can trust her there or anywhere. She leaves me without blame, and she will live so, I am sure. If I should die—I may perhaps while she is still young; I have lost some courage in a few hours—she'll find that I remembered her, and loved her to the last! This is the end of what you showed me. Now, it's over!"

"Oh no, John, not over. Do not say it's over yet! Not quite yet. I have heard your noble words. I could not steal away, pretending to be ignorant of what has affected me with such deep gratitude. Do not say it's over, till the clock has struck again!"

'Dot had entered shortly after Tackleton, and had remained there. She never looked at Tackleton, but fixed her eyes upon her husband. But she kept away from him, setting as wide a space as possible between them; and though she spoke with most impassioned earnestness, she went no nearer to him even then. How different in this from her old self!

"No hand can make the clock which will strike again for me the hours that are gone," replied the carrier with a faint smile. "But let it be so, if you will, my dear. It will strike soon. It's of little matter what we say. I'd try to please you in a harder case than that."

"Well," muttered Tackleton, "I must be off; for when the clock strikes again, it'll be necessary for me to be upon my way to church. Good morning, John Peerybingle. I'm sorry to be deprived of the pleasure of your company. Sorry for the loss, and the occasion of it too!" * *

'The carrier stood looking after him until he was smaller in the distance than his horse's flowers and favours near at hand; and then with a deep sigh, went strolling like a restless broken man among some neighbouring elms, unwilling to return until the clock was on the eve of striking.'

Here we are certainly taught a beautiful lesson; nor is the effect of the *denouement*, which must now be obvious enough to our readers, lost upon Tackleton himself. When once he has got over the unpleasant sense of having been jilted at the very church-door, reflection and conversion comes. He transfers all his wedding preparations to the rival party, visits it himself, and joins heartily in the festivity.

'"Mrs Peerybingle," said the toy-merchant, hat in hand, "I'm sorry; I'm more sorry than I was this morning; I have had time to think of it. John Peerybingle, I'm sour by disposition; but I can't help being sweetened, more or less, by coming face to face with such a man as you. Caleb, this unconscious little nurse gave me a broken hint last night, of which I have found the thread. I blush to think how easily I might have bound you and your daughter to me, and what a miserable idiot I was, when I took her for one. Friends, one and all, my house is very lonely to-night. I have not so much as a Cricket on my Hearth. I have scared them all away. Be gracious to me: let me join this happy party."

'He was at home in five minutes. You never saw such a fellow. What *had* he been doing with himself all his life, never to have known before his great capacity of being jovial! Or what had the fairies been doing with him, to have effected such a change!'

We have now done enough to show what are the moral elements of Mr Dickens's present tale. Nothing remains for us but to hope that his future publications will be at least as harmless and innocent, if less simple and primitive, in conception and incident.

CONSOLATION FOR ABSENCE.

[From Mr Gostick's interesting volume—'The Spirit of German Poetry.' This piece of surprising beauty and elegance is, in the original, the composition of Louise Brachmann, a singular half-crazed person of Sappho-like demeanour, and who, after many odd adventures, came to Sappho's fate in her forty-third year.]

Our eyes still drink from the same fount of light;
The same wind round us softly breathes or blows;
We both lie veiled in the same cloud of night;
One spring to both its opening glories shows.

When morning dawns, I cry: 'Awaken day!
And strew thy roses wheresoe'er he roam;'
When in the sea the sun is sinking—'stay,
And cast a gleam to light him to his home.

'Still glow upon the hill his eyes behold
With beams of promise, when his heart feels lone,
While on yon coppice, tinged with fainter gold,
I gaze till all the evening glow is gone.'

What lofty mountain is he travelling o'er?
What favoured valley do his eyes survey?
What happy lake, beside some foreign shore,
Mirrors his beauteous aspect, far away?

In visionary, moonlit, silent night,
When ghostly forms on distant mountains shine,
My heart beats high—I say with deep delight:
'He lives—however distant, he is *mine*!'

And, as the stars look out, a gladdening ray
Seems darting from his eye to cheer my heart—
All thoughts of earthly distance melt away,
We meet in heaven—and never more to part!

THE PLAGUE OF THE PERSONAL.

Considering that man is chiefly an immaterial being, it seems a great pity that he should have been clogged for a few short years of his existence with such a thing as a body. It is a sad plague, this body of his, on many accounts. For one thing, at the very first, it is a troublesome thing to transport. At a natural rate of going, four miles an hour is the utmost of its locomotive power. Vehicles of all kinds, from a horse to a steam railway carriage, are attended with monstrous trouble and inconvenience. How different had we been spiritual solely—able, like Ariel, to girdle the earth in forty minutes! Then this same gross structure of ours is so liable to damage. Only think of a railway collision, or the consequences of your horse taking fright in that emblem of your respectability, a gig! Think of what a syncope your soul may experience through a severe bruise or wound—nay, saving your presence, an oversharp dose from a doctor still in the bondage of allopathy. Think of sea-sickness! That noble thing, the mind, prostrated by a little see-sawing on rough water. Is it not all very vexing? Particularly as you know the body to be such a subordinate and unimportant part of you. What right has so gross and paltry a thing to interfere so much with your comfort, and take so much from your dignity?

Inferior and unessential too as it is, we see such considerations attached to it. While unanimous as to the mind being the only thing worth looking to, not one of us but admires pretty girls and handsome young fellows, according to the sex we be of. The gramineous character of all flesh is a truism, on which all flesh is unanimous; yet what care is universally shown to keep the verdure in its trimmest possible state. With one breath we express our disesteem for this poor tabernacle of the soul—with another we scold the tailor or milliner for some little failure in adorning it. We preach of the beauties of the mind, and exhaust the dentist's ingenuity to preserve one of our incisors. Take the most unworldly-minded of us, and ask his opinion of wooden legs! To men regarding the mind as solely valuable, it should be a matter of indifference whether a limb be of the statutory material or ligneous; yet is there a choice? 'But the original leg is the more convenient.' That is not the reason; but no matter. Take the case of red hair instead. This is as 'convenient' as brown or black, or fair or auburn; but will any one say the point is indifferent? Why, it is such things which determine for some women whether they are to be countesses! And not merely this; but good-looking people have everywhere a chance of being better liked than plain people. They are apt to be popular without any other attractive qualities, and with no trouble on their part; while it usually costs plain people a world of exertion merely to overcome the repugnance which is instinctively felt for them. Does this speak to externals being indifferent? Does it show the body to be of no sort of consequence? Alas! the very contrary. It should not be so; but it is so. The personal comes in to traverse and confound all our ideas of merit. We can't tell whether a man is to be more indebted to scientific attainments or to whiskers; or whether a young lady's prospects are most likely to be affected by her amiable character and good sense, or that peculiar dimple formed near the corner of her mouth when she smiles!

The world proclaims the inferiority of the personal; but I would just ask one question. Did it ever conspire to establish the equal importance of men of five and men of six feet? No such thing was ever heard of. And, accordingly, we see a man of five feet go through the world, a perpetual martyr to the injustice of his fellow-creatures. There is a full abstract admission of his equality; he counts as a 'soul' in population returns and paragraphs about accidents, the same as the six-feet man; he is the same in the eye of the law, pays the same taxes, has alike his epitaph and elegy. But he is never the same in the reckoning of men. The gravest, the most gentle smile at the little man. With the rude he is the theme of perpetual jokes. His choice of a wife is narrowed to the small number of women inferior to himself in stature. Symptoms of self-esteem, which would be passed over unnoticed in other men, appear monstrously ridiculous in him, though he has as good a right to stand well with himself as any giant of them all. Odd notions, or a shrill voice, or whimsical tastes, in his case excite ridicule and give birth to nicknames, where bigger men would escape. In fact, a man of unusually small stature is, from his cradle to his grave, under a difficulty unknown to other men. The dwarfishness is something always to be overcome in the first place, before he can start fair with other men. What is perhaps worst, he is unavoidably sensible of the involuntary demerit, and affected in his most ordinary conduct by a consideration of it. It drives him to do and say absurd things, in the desperate anxiety to get the better of it; and this makes him only be the more laughed at. Verily, the little man knows whether the frail corpus be of much consequence to a human being or not.

The plague of the personal is particularly seen in men whose main function in life is that of exercising the intellect. Men of mind, as I may call them comprehensively, ought not to have bodies at all. Bodies merely impede their operations. It is only the lowest and simplest form of this trouble, that literary men must eat, and that they have families who must eat also. Very sad, no doubt, are the vexations from this cause; alien and unsuitable tasks, hard drudging work, quarrels with grudging publishers. But there are

higher and more sentimental evils which fine souls find still less endurable. The Spectator first remarked the prevalent desire to discover of a distinguished author whether he is a tall man or a short man, handsome or plain, and so forth. It is perhaps eminently natural, but must to many authors be extremely annoying. Seldom is the personal in such cases equal to the mind: often it is homely, blemished, insignificant. For such an author as he of Waverley to have men—ay, and women—coming to get a sight of his poor coil of flesh, and going away, saying, 'What an ordinary-looking man he is! lame too!'—could not, one would think, but be vexing even to that placid being; or if it was not, it ought to have been so. For worship of the mental emanations to show itself in this meddling curiosity about the form of a visage or the hue of a complexion, is surely most unworthy. There is the work, most likely expressed from a teeming mind of superior native qualities, and not expressible from anything else—take it as it is, and be content with it, as one of God's good gifts to man—the personal has nothing to do with it. Perish this despicable personal altogether, beside the consideration of the mind's craft, which may indeed not be worth remembering ten years; for fashions change, and one man's good things supplant another's, but yet is *capable* of being preserved through all time.

For such reasons, I have sometimes thought it fortunate for certain authors that they have no biography. For only observe what a biography is. We learn from Pope's that he was crook-backed and spider-like, ill-natured, and over-fond of stewed lampreys. Now, is it not vexing to think of these personal matters attending for ever the name of Pope and the admiration of his writings? How much better to be a Homer, of whom nothing is certainly known whatever! We there worship the pure mind alone—a name, a word, being all that survives besides. This is the only right immortality, because thus only that continues to live which deserves to do so, or which mankind have any concern in seeing live. Shakspeare seems to have been amongst the most fortunate of modern authors in this respect. He is, as I once had occasion to remark before, almost a mythic being. There are his six-and-thirty plays, as sound and fresh as compositors and commentators could allow them to be: all of him that we have any real concern in possessing, we possess: all which he desired to see preserved, is preserved. The rest is fallen into the forgetfulness which befits it. Men will still puzzle after his personal facts—his worldly means, his style of living, his righteousness towards his wife, and whether she married again—but it is almost wholly in vain. A chinkless cloud-veil shrouds it all. Shakspeare has the happiness, as an immortal, to be only SHAKSPEARE! How different for poor Kit Marlow to have the ugly fact of his death in a base brawl ever staring his name in the face! How sad, in comparison, for Otway to be remembered as one choked in hunger by a roll! Literary biography in general is little better than a catalogue of human woes. It really is too bad that these poor sons of genius should both, for the most part, find no seats secured for them at the table where all who will work are fed, but also have their lustrous pages dimmed and blotted by the remembrance of their penurious miseries. Let us starve, they might say; but be our garrets and our rags consigned to oblivion. If there be any dignity to be attached to the product of our pens, let it not be profaned by details of our shabby personal existences.

It would even be better for readers, merely with a regard to their enjoyment of the writings of the immortals, if there were no such thing as literary biography. Regarding an author as only a Voice, we should have a much greater interest in him and his works than otherwise. Perfectly abstracted from all these sorry particulars as to birth and death, bodily form, good or bad fortune, we should treat his writings more purely according to their merits, and love them for their own sake only. The imagination would in most cases make a much better biography for the author than his actual life could have furnished. In a case, for example, like that of Byron, we should be left free to surmise all kinds of unhappiness that ever were known, and others besides, for the mournful misanthropic spirit which shines through those verses. It would have been like the effect of that deep-cut word which arrests us in pacing the cloister at Worcester—MISERRIMUS—word more eloquent than volumes could be. Compared with a biography thus suggested, the *knowledge* that Byron had a maddish mother, that he proved incapable of the domestic virtues, and consequently got into bad terms with British society, and was forced to take refuge in a moody retirement on the continent, is worse than tame; it is destructive of all fine sentiment in the case. It is a strange fatality in us that compels our seeking for these personal details, and reading them in volumes quarto and octavo. We blindly rush to gratify a superficial feeling of the moment, and spoil for ever the deeper and more abiding gratifications to be derived from the intellectual part of the man, if taken unconnectedly with the personal.

It is only another form of the same fatal curiosity which impels many persons to become what are called Lion-hunters. Not content with receiving into their souls the divine thoughts which the gifted have been allowed to utter, they must run hither and thither for an opportunity of beholding the poor personality of the author, with all the blemishes which may rest upon it, so contrarious to the beauty of his intellectual being—to hear him speak, perhaps, and in his tremor murder that English which he discourses so finely with his pen—or to watch him as he eats, and learn that his noble soul is attended by tastes utterly mean and trifling. Surely this is a sad perversity amongst the lovers of the intellectual. Far better it were to remain in ignorance of the paltry personal altogether, and allow ourselves to think of our favourite author only as an abstraction, or, if in any tangible form at all, at the most as the book in which we read his thoughts.

> 'I have a fancy of my own,
> And why should I undo it?'

These thoughts are almost whimsical, and are half meant to be so; but, after all, they point to a serious truth. The personal is inextricable, in our present form of being, from the mental, and it has, in many circumstances, an apparently exclusive importance. Yet, on all considerations really worth speaking of, the mind is what truly constitutes the man. It is not the tongue which speaks, or the eye that sees; it is the mind. It is not the body which drags us into error; it is the mind. And, accordingly, we may know what pretensions any one has to be a judge of his fellow-creatures, as we observe him tend more or less to estimate them according to material or immaterial peculiarities. The weak, the gross, the frivolous, fasten upon the tangible, and the tangible only. They see but in Pope the waspish little humpback; in Burns only the ploughman. The thoughtful and refined, on the contrary, speak little of

any of these trivial particulars, but expatiate with generous ardour on the Inner Being, whence flow the winged and deathless words, and to which all else is but external and accidental.

INTEGRITY—A TALE.

BY MISS ANNA MARIA SARGEANT.

In the little front parlour of a private house in one of the small streets of Lambeth sat two females, busily occupied with needlework. One was a thin spare woman, in the decline of life, whose garb proclaimed her to be a widow; the other, a pale delicate girl, over whose brow twenty summers scarcely seemed to have passed. They were silent, and it was evident, from the gestures of the younger, that they were in expectation of a visitor, for her eye glanced ever and anon at a Dutch clock, which ticked audibly in one corner of the room, and her ear anxiously listened to every step which passed the window. It was night, and the single candle which burned upon the round oak table cast its feeble rays upon the simple white dress which they were making, and which seemed to be an object of peculiar interest to both. 'Ah, I well remember, six-and-twenty years ago, making up my wedding-gown,' the elder female at length broke silence by observing; 'and my young heart was then like yours, Lucy, full of hopes and plans for the future; but you know, my child, how those hopes have been disappointed,' she added with a heavy sigh.

'Dear mother,' the maiden interposed, whilst her pale features beamed with animation, 'I think *I* can scarcely be disappointed in *my* hopes and expectations, for I have none beyond what may reasonably be drawn from the present position of things. I have already experienced too much of the world's rough usage to entertain any ideas of happiness or prosperity which are not likely to be realised.'

'You have, indeed, my child, been schooled by affliction. At your age I knew not what sorrow was. I thought when I married that I was but entering on a scene of happiness; instead of which, it was my first step towards misery.'

'I trust, however, that your age will be rendered tranquil,' the maiden resumed, looking tenderly in her parent's face.

A well-known step beneath the window here attracted the attention of Lucy; and ere the knocker had finished its office, she was at the street door, with her hand locked within that of her intended husband. They re-entered the room together, and the maiden called his attention to the dress upon which she and her mother had been engaged, playfully demanding his opinion of the taste she had displayed in its fabrication. 'Dear Walter!' she exclaimed in surprise and concern, seeing him turn away with a sickening smile, 'what has occurred to distress you—forgive my levity—you are surely in trouble, or seriously ill?'

'I am not ill, dearest Lucy,' the young man made answer, with a strong effort at composure. 'Don't alarm yourself, my love; something has occurred which has much distressed me, and which must postpone our marriage for a short time; but I will tell you all presently,' he added, as he sunk upon the chair which his attentive bride-elect had already placed for him beside the fire.

'What can be the matter, Walter?' cried Mrs Weldon impatiently; 'I had a presentiment that some evil was in reserve for us.'

Lucy did not speak, but her hands instinctively dropped the robe she had been exhibiting, and her eyes rested anxiously on his countenance.

'You know, dear Lucy,' the lover began, 'that I told you last night that I was empowered by my master to receive the sum of eighty pounds, and that I was flattered by the confidence he reposed in me; judge, then, my distress of mind when, on applying for it this morning, I was told that it had been paid already; that a young man, representing himself to be a servant of Mr Gratton's, had produced a bill exactly corresponding with the one I presented, and signed his name Walter Ormond. The clerk who had paid the money had, unfortunately for me, taken so little notice of his person, that he could not describe him; and he went as far as to imply that I had made a double demand. The signature was shown to me, and it really so nearly resembled my own, that I could scarcely say that it was not penned by me. I hastened, however, to my master, and stated to him the whole affair, which is so involved in mystery, that my character cannot be fully cleared excepting by the disclosure of the truth. Mr Gratton is too generous unwillingly to suspect my honesty; yet the evidence is so strong against me, that I am sure he must entertain some doubt. I am supported by the acquittal of my own conscience,' he added, 'but I cannot offer you, dearest, a name tarnished by suspicion. A short time will perhaps bring the matter to light, and then it will be my highest happiness to solicit you to bear it, and to share my fortunes.'

As Walter concluded, Lucy, who had listened with an interest the most intense, put her hand within his with a look of confiding tenderness, which touched her lover more than any language could have done: but Mrs Weldon's grief was more noisy; she burst into floods of hysteric tears, which her daughter in vain strove to soothe. Thus passed the evening which poor Lucy had begun so happily; but none—not even her lover—surmised the depth of anguish her gentle heart was called to endure. A suspicion of the most horrible nature had presented itself to her mind, and it was one she dared not breathe, even to the mother from whom she had never before concealed a thought.

Walter Ormond was a lodger in the house of Mrs Weldon; he had not therefore far to retire at the wonted hour of rest. 'Cheer up,' dear Lucy, he said at parting; 'I cannot think that I shall long be permitted to lie under a stigma of this nature. Time will reveal the perpetrator of the fraud, and my character will then be cleared.' Lucy faintly smiled in answer.

'Do, dearest mother, go to rest,' she cried, addressing her parent, when her lover had quitted the room. 'I will sit up for George: he will not be very late, I daresay.' The mother yielded to her intreaties, and she was left alone.

The midnight hour passed, and Lucy still sat occupied with her needle, giving the last finish to her wedding-dress, though it was with an aching heart. Young as she was, Lucy Weldon had, as her mother had said, been schooled by adversity. Her father, by profligacy and intemperance, had brought his family from competency to the lowest depths of poverty, and the industry of his wife and daughter had alone saved them from starvation. His death had been sudden and dreadful, having been caused by an accident which occurred whilst he was in a state of intoxication. But the sad fate of the father had failed to warn his son from pursuing a similar course; on the contrary, the example of the parent seemed to stimulate him to run the same length in folly and vice. Since the decease of Mr Weldon, George had professed to maintain his mother and sister from the profits of a business in which he was engaged; but it was little assistance that he really afforded them, and they were obliged to let part of the house, and still labour hard with the needle, to provide the common necessaries of life.

Another hour passed ere the young man made his appearance; but when he came, he offered no apology for his late return. His spirits were so much excited, that he did not notice the expression of unusual sadness which sat upon his sister's countenance. 'I have a present for you for your bridal, Lucy,' he triumphantly exclaimed, displaying as he spoke a little box, containing a handsome pair of gold ear-rings. Lucy turned from him with a sickening shudder.

'I thank you, George,' she with difficulty faltered

forth, 'but I value not such baubles, nor do I know that I shall ever be a bride.'

'Now that is an ungracious way to receive my present,' he observed. 'I thought to see you look very stylish; and I have bought a new watch for myself to grace your wedding also.'

'I tell you that I have no wedding in prospect,' she returned, whilst her heart beat with violence, and her cheek turned to an ashy paleness.

'What can you mean?' interrogated the young man: 'has Walter proved a rascal? If so, he shall feel the effects of my wrath.'

'Spare your threats, George,' his sister interposed; 'Walter is not to blame—he is to be pitied. God only knows who is the perpetrator of the crime.'

'You speak in such enigmas, I really cannot understand you,' George observed; but the eager eye of his sister perceived that his colour changed and his lips trembled.

'Can you say that you know nothing of the matter?' she asked, looking earnestly in his face.

'How should I know, girl?' was his dogged reply.

Lucy's feelings were too poignant for endurance, and she burst into a passion of tears. 'Oh, George,' she exclaimed, 'as you value the happiness of your sister, the peace of your mother, and, above all, the approbation of your own conscience, confess the truth, and do your utmost to make reparation for the fraud you have committed. I surmised it all ere you appeared; and these baubles too surely corroborate my worst fears.'

'Lucy, are you mad?' the young man demanded with feigned astonishment.

'I am not mad,' she returned, 'though the mental torture I have endured for the last few hours has been enough to deprive me of reason; but I am deeply concerned in this matter, upon your account as well as Walter's. He is writhing under the possibility of having his honesty suspected; and you, oh, my brother, you are—you cannot deny it—the guilty person who has brought this misery upon us? Think,' she pursued, finding that he remained silent—'think upon the anguish you have already caused me and Walter; think that you will bring our dear mother in sorrow to the grave, if you persist in the sad course you have of late pursued; think how you will answer at the final day of account for the crimes you have committed; and for my sake, for your parent's, and for your own sake, let me intreat of you to commence a new life.' As she concluded, she rose from the seat upon which she had sunk, and throwing her arms around him, wept convulsively. The young man's heart was penetrated; he could not answer; and when he felt her tears upon his cheek, he could with difficulty repress his own. But these emotions were of short continuance; pride and long-indulged habits obtained the mastery over affection and conscience, and roughly pushing her from him, he fiercely demanded if she intended to become his accuser, and procure him fourteen years of exile. 'Oh, my brother,' Lucy passionately returned, 'you know that it would break my heart to see any evil happen to you, above all, to become your accuser; but the good name of one equally dear to me is at stake, and justice demands that the innocent should be exonerated from the suspicion of crime.'

'What proof have you of the truth of your surmises?' he bitterly interrogated.

'George, George, why will you agonise me thus? Let there be no necessity for me to tax you with the crime; make the confession yourself, and all the restitution you have in your power. Surely you have not yet parted with the money? or if you have done so, you have at least effects to the amount.'

'I have nothing but these ear-rings and my watch,' was his reply, 'and they, together, cost me thirteen pounds.'

'What can you have done with the remainder of the sum?' she asked in breathless agitation.

'I have lost it.'

'Lost it! By what means?'

'No matter by what means.'

'Yes, George, it does matter by what means. I must know whether you were robbed of it by a stranger, or whether, as I have reason to surmise, you have spent it at a gaming-table.' He turned from her, but did not reply. 'My conjecture is but too true,' she pursued. 'Oh, George, for a night of what you call pleasure, you have plunged us all in misery, exposed your person to the penalty of your country's broken laws, and added a dark crime to the catalogue of your offences, for which you know not how soon you may have to answer.'

'Cease to reproach me, Lucy,' cried the young man; 'I am already cut to the quick by my misfortunes; but I shall have better luck to-morrow, and then I will make amends for all. I am really sorry to have put off your wedding.'

'What! would you try to redeem the past by plunging into further vice?' his sister asked. 'No, George, if you have no means of making restitution but by committing another sin, I pray you forbear; I will endure it all. I will promise secrecy, though it will cost me more than I can express to abide by it. I will do anything, if you will forsake the companions who have led you into your present evil course. Will you do this, dear George?' she pleaded, once again twining her arms around him. 'You were wont to love me dearly, when we were children; you used to say that you could refuse me nothing. Let affection, if you have no higher motive, now induce you to comply. I plead for the sake of all who love you, but oh, my brother, mostly for your own sake, for you are injuring yourself most deeply.'

Again the young man was overcome. 'I will promise you, Lucy,' he at length articulated, pressing her to his heart in a close embrace; and with these words he hastened from the room, to the solitude of his own chamber.

With a heavy heart Lucy retired also, but her thoughts were too busily occupied with the dreadful transactions of the day for sleep to visit her pillow. Her mother and lover noticed her unusual paleness at the breakfast hour, and Walter, attributing it to the uneasiness she felt on his account, again strove to cheer her by encouraging hopes of a speedy discovery of the truth, little imagining the distress such a discovery would bring.

'My opinion was always in accordance with the old adage, that "honesty is the best policy,"' cried Walter Ormond one evening, as, with a countenance radiant with smiles, he sat himself beside his gentle mistress, who was, as usual, busily occupied with her needle. 'Don't think me an egotist, dearest Lucy,' he pursued, 'when I tell you that Mr Gratton was so much pleased with the manner in which I negotiated an affair of trust for him yesterday, that he has to-day offered me the travelling department of his business, which will be better for my health than the confinement of the warehouse, and, moreover, yield me a larger salary.'

Lucy, overwhelmed with feelings of gratitude and pleasure, burst into a flood of tears.

'I am more especially pleased with the offer,' the young man resumed, 'because it proves the high opinion my master entertains of my probity, notwithstanding the late occurrence. I know that I have been tested by a strict scrutiny, which, though very painful at the time, has in the end afforded me the satisfaction of feeling that my character is raised in Mr Gratton's esteem. And now, my own Lucy,' he proceeded, taking the maiden's yielding hand within his own, and pressing it with tenderness, 'now there is no further occasion for delaying our marriage.'

As Lucy would on no account leave her widowed mother, and was unwilling to separate her wholly from her son, it had been arranged that the young couple should occupy a floor in the same house, and an early day was now appointed for the celebration of the nup-

tials. Had George, however, dared to express his real sentiments, he would have preferred being left alone, hoping thus to escape the watchful eyes of those who could not do otherwise than feel pained by his conduct, and, above all, to be freed from the affectionate remonstrances of his sister, which he dreaded more than anything beside.

The eventful morning came, and Lucy, when arrayed in her pure white dress, appeared more beautiful than ever to her admiring lover. She took her accustomed place at the breakfast table, and the only difference observable in her countenance was, that her usually pale cheek was slightly flushed with the excitement of the occasion. Mrs Weldon was in good spirits, and George seemed little less pleased than Walter himself. Their only guests were an elderly man who had been intimate with the family for many years, and his youthful daughter, who were to perform the offices of father and bride's-maid. Never did a marriage seem to promise more durable happiness, though it was without the festivities which accompany the nuptials of the high-born and the wealthy. Walter, more from the desire to shield his retiring bride from vulgar curiosity than from pride, had engaged a coach to convey them to the church, and Lucy had just finally arranged her attire, when a vehicle drove up to the door. Ere she stepped forth to enter it, she turned to imprint a kiss of affection on the cheek of that beloved parent who was now about to yield her up to the protection of another, and as she did so, a scuffle in the passage attracted her attention, and caused a dread of she knew not what to so far overcome her, that she sunk almost fainting into her mother's arms.

'What means this tumult?' cried Walter, darting towards the door, which George had opened; but his anger was exchanged for alarm, when he beheld the young man within the firm grasp of two sturdy fellows, who were evidently officers of justice.

'George Weldon is our prisoner,' exclaimed one of them, addressing the inquirer; 'and we have a warrant to search this house.'

'What can this mean?' interrogated Walter, looking earnestly in the countenance of his intended brother-in-law. 'What can you have done to subject yourself to this outrage?'

George did not reply.

'He has only made himself expert at counterfeiting people's signatures,' returned the officer with a laugh.

'Can this be true?' exclaimed Walter in breathless agitation, and the mysterious transaction which had so nearly caused the loss of his own character arose to his recollection as he spoke. George still maintained a dogged silence. The wedding party had by this time congregated at the parlour door, and their appearance denoting the ceremony which was about to have taken place, the men, supposing their prisoner to be the intended bridegroom, rudely commented on the change of scene which had occurred. Intreating them, for the sake of the females, to spare their taunts, Walter now hastened to the terrified Lucy, and endeavoured to dissipate her fears. Mrs Weldon could not believe that her son had been guilty of the crime of which he was accused, and in piteous accents begged of her intended son-in-law to accompany him, and do his utmost to save him from the ignominy of being imprisoned. 'If George can prove his innocence, he has nothing to fear,' pleaded the young man; but a sad presentiment filled his own mind, though he strove to buoy up others with hope.

The house now underwent a thorough search, and within the covers of an old pocket-book, which was found in the chamber of the unhappy young man, a number of pieces of paper were discovered, upon which imitations of signatures had been made. Walter endeavoured to prevent this circumstance coming to Lucy's knowledge; but in vain; and so powerful was the shock her feelings sustained, that she was carried fainting from the scene of tumult to the house of their neighbour and friend Mr. Jones. The grief of the mother was not less intense; already had she been a severe sufferer from the misconduct of others. Her married life had been a daily martyrdom, yet never had she endured anything so poignant as the present calamity. On Lucy's return to consciousness, she saw the necessity there was for the exercise of firmness on her part, that she might become her parent's comforter; and whilst disrobing herself of her bridal habiliments, and setting aside the few things which served to remind them of the happiness they had that morning anticipated, her mind was busily occupied in endeavouring to form some plan whereby she might serve her still tenderly-beloved, though unworthy brother. Walter returned, without bringing any cheering intelligence. The delinquent had been put into close confinement, there to await his trial at the next sessions.

We will pass over the period of intense solicitude which preceded the trial, and the still more harrowing anxieties which attended that event. Suffice it to say, that every exertion which affection could suggest was made for George. His mother and sister sacrificed almost all the worldly wealth they possessed to provide able counsel, which succeeded so far as to procure some mitigation of the sentence; and fourteen years of banishment was awarded him. In the course of the examination, the fraudulent act committed against Mr Gratton became known; but that gentleman, being aware of the intended connexion between Walter Ormond and Lucy, generously forbore to appear against him for their sakes.

No language can describe the feelings of the wretched family when the sentence was passed, and all hope of acquittal was over. The lacerated heart of the mother could bear no more: she fell a victim to the intensity of her grief, leaving her afflicted and orphan child to the protection of the high-principled young man, whose love had been but further cemented by the disgrace and misery which had overwhelmed them. It was the dying woman's last request, that the marriage of the young people should take place as soon as her remains were consigned to the grave; and happy was it for the sorrow-stricken girl that she possessed one faithful friend in this hour of deep distress. Sad, however, were the feelings with which she laid aside, for one day only, the habiliments of mourning, and arrayed herself in that bridal dress which seemed destined to be worn in sorrow.

Such are the scenes of misery, such is the devastation, a career of vice too often produces. The guilty cannot suffer *alone;* for one wrong action may bring a train of evils upon the innocent, the extent of which it is impossible to compute.

There was one other gentle breast which had received a wound not less severe than that Lucy had experienced, though it bled in secret. Catherine Jones, the daughter of Mrs Weldon's aged friend, had from childhood regarded George with affection, having, with the wilful blindness of love, drawn a veil over the imperfections of his character. Though no engagement had ever existed between them, she had reason to believe that the attachment was reciprocal, and her young heart had fondly anticipated a future of happiness as his wife. How keen, therefore, was her disappointment when she discovered that his principles were corrupted! But even when he became an outcast and an exile, she withheld not her sympathy, but pleaded his youth, and the evil example of his father, as an apology for the crimes of which he had been guilty.

It was nearly fifteen years subsequent to the period of George Weldon's banishment, that a man in the meridian of life, but whose wasted form, wan aspect, and grizzled hair, bespoke premature decay, stood on the threshold of the house which had once been the abode of the Weldons, and in a tremulous voice inquired if that family still resided there. The young woman to whom the question was addressed, after replying somewhat discourteously in the negative, shut the door abruptly in his face, deeming his appearance too suspicious

to demand better treatment. George (for it was he) turned from the house which had been the home of his youth with a sickening heart, and bent his steps towards that which had been the residence of his mother's friend, Mr Jones, trusting that he should here at least be able to gain some information regarding his sister. The death of his parent had been communicated to him by letter, and he had also received intelligence of Lucy's marriage, but, from some unknown cause, the correspondence had not been carried on for the last six years. He was therefore fearful lest death might have robbed him of this last tie, and that Walter, desirous of dropping a connexion which had disgraced him, had purposely avoided further communication with him. To his unspeakable satisfaction, he found Mr Jones still in his old abode; but time, hardship, and mental suffering, had wrought so great a change in the person of the returned exile, that he was under the painful necessity of making himself known to his former friend.

'George Weldon! Is it possible?' the old man exclaimed, raising his hands and eyes as he spoke.

'Well may you not recognise me, sir; I am indeed altered,' cried the wanderer. 'But tell me, I beseech you, of my sister. Does she live?' The suppressed breath of the inquirer bespoke the intensity of interest he felt in the reply, and it called forth the commiseration of his aged companion, who deemed that the heart in which affection is unextinguished, cannot be wholly lost to virtue, however crime may have debased it.

'She does live, my friend,' Jones exclaimed, warmly grasping the hand of his guest as he spoke, 'and, I am happy to add, in improved circumstances. Her husband is now a partner in the house of business in which you left him a servant, and they consequently left the humble abode your mother occupied in this neighbourhood, for one more commodious, six or seven years ago.'

'Thank Heaven she lives!' ejaculated the brother in extreme agitation.

'And do you not rejoice in her prosperity?' Jones somewhat reproachfully asked.

'I do most fervently,' was the reply; 'but I cannot but feel that this circumstance will separate me more widely than ever from my only remaining relative—the only being I have now on earth to love. Walter Ormond, as the partner of Mr Gratton, must wish to avoid an outcast like me, and this accounts for the long silence which led me to believe my sister dead.'

'It does no such thing, boy. You do Lucy injustice by the supposition. I promise you as hearty a greeting in their handsome new house at Peckham, as if you had found them still living in a back street at Lambeth, like their old friend Jones, for they have mourned *you* as dead, not having heard from you so long.'

'You afford me unspeakable happiness by that assurance, sir,' George exclaimed, his eyes filling with tears he vainly endeavoured to repress. 'But Lucy ever was an angel, and if her example had influenced me as it ought to have done, I never should have been the wretch I am.'

'Well, we will hope that you will do all you can to redeem past offences by your future good conduct,' Jones soothingly interposed.

'Alas!' replied the culprit, 'I have, I feel, returned to my native land to *die*. But if I am permitted to breathe my last near to my sweet sister, it is more than I deserve.'

The old man gazed mournfully on the wasted form before him, and felt that the prophecy would but too probably be accomplished. Although on the verge of eighty, his own form was still hale and vigorous, and he grieved over the premature decay of one who might, he thought, have numbered as many years, had he not become amenable to his country's laws.

'You are too weak, and too much excited, to bear a meeting with your sister at present,' he kindly said; 'but you shall, if agreeable to you, stay the night with me, and I will to-morrow break the intelligence of your arrival to your relatives.'

George thankfully accepted of the hospitable and considerate offer. But a further trial awaited him: he must meet the eye of Catherine, who, her father (unsuspicious of their former attachment) informed him, was still unmarried, devoting the meridian of her days, as she had done her youth, to his comfort and happiness.

'May I ask that you will spare me, by not making my name known to your daughter?' George asked with extreme agitation, which did not escape the notice of his host. Jones promised compliance. But the caution was unavailing; for no sooner did Catherine, who had been absent for a few hours, re-enter the room, than she recognised her early lover. Changed and haggard as he was, his lineaments were too deeply graven on her heart to be erased by time. The romance of youth had, however, given place to the more prudent decisions of maturer years in the breast of the ever amiable and loving, but now firm-minded woman, and, after a brief struggle with her feelings, she was enabled to greet him without the appearance of emotion. The feelings of the conscience-stricken exile were not so easily controlled. The sight of one he had once tenderly loved awakened a thousand reminiscences of a painful nature, and he gladly availed himself of his kind host's invitation, to retire early, that he might, as he said, recruit his strength, and be better prepared for the meeting with his family on the morrow.

They met—the long-banished brother, stained by crime, and branded with ignominy, and the fond, affectionate sister, whom no changes, nor even crimes, could alienate; and the now humbled soul of the outcast poured forth its penitence on that faithful bosom. Time, which had reduced the once fine athletic form of George Weldon to a mere shadow, had wrought no other alteration in Lucy, than that it had ripened her girlish charms into matronly beauty. There was still the same sweet, but somewhat sad expression on her placid countenance; for her present prosperity could not wholly obliterate the remembrance of her early griefs.

The home in which George now found his sister presiding, was, unlike that of her girlhood, the abode of peace and plenty. It was furnished with everything that could contribute to comfort, although nothing superfluous was to be found there. The exile was welcomed with a cordiality on Walter's part, and a tenderness on Lucy's, which he had not dared to hope or expect, but which met with a return of the most lively gratitude. When it was rumoured in the neighbourhood that a brother of Mrs Ormond's had come from abroad, and was staying at her house, in the hope of recruiting his health, it was little imagined that he was the George Weldon who, fifteen years previously, had been arraigned at the bar of justice, and condemned as a felon: but notwithstanding that this circumstance was concealed from the world, the culprit experienced that self-abasement which is the sure accompaniment of guilt. He could scarcely endure to meet the open countenance of his high-principled brother-in-law, conscious, as he could not but be, that Walter's good conduct alone had conducted him to his present competence, and that, having had even greater opportunities, he himself might have been equally prosperous had he pursued a similar course. But for the disgrace and trouble he had brought upon his family, his tender mother might, he thought, be now witnessing the happiness of her deservedly-beloved child: but for his deviation from the path of probity, he might have been the support of her declining years, instead of having been the cause of her death. All these recollections and self-upbraidings, together with his keen sense of shame, operated powerfully upon his naturally sensitive mind, and tended to strengthen a disease which years of toil, privation, and suffering, had brought on. It was his own prophecy, that he had returned to die in his native land; and it proved true. Neither affection nor skill could arrest the progress of the malady, and, after lingering for some months a helpless and hopeless invalid, he breathed his last on the bosom of that

faithful sister whose affection he had so fully tested, and to whom he had been, through life, little else but a source of unhappiness.

Thus perished George Weldon in the meridian of his days, the victim of evil example and his own vices. His dying hours were, however, marked by sincere repentance. Reader, this tale is not wholly fictitious; the crimes and the sad end of its hero are sketched from life, and are here related to hold forth a lesson of warning.

POPULAR NAMES.

THE CARMAGNOLE.

The Carmagnole was the name of a song and dance which became popular during the terrible days of the French Revolution. Expressive of a quick step, lively and animating, the air was a prodigious favourite with the Parisian mobs of that time, who used to call for it from military bands and the orchestras of theatres, and join in dancing to it, singing at the same time the doggrel verses which had been composed for it—some of which are here translated. They evidently bear reference to the first triumphs over the royal family and their friends in August and September 1792 (Monsieur Veto was a nickname for Louis XVI.):—

Madame Veto declared that she
Would slaughter send through all Paris:
She lost, as it appears,
Thanks to our cannoneers,
Let us dance the Carmagnole, &c.

Monsieur Veto did vow that he
Would to his country faithful be:
How has he kept his word?
No quarter—now the sword!
Let us dance, &c.

Antoinette resolved, good lack!
To make us fall upon our back:
She missed; and as we rose,
She got a broken nose.
Let us dance, &c.

* * *

I'm a *sans-culotte*, and sing,
Spite the council and the king:
Hurra Marseilles—the cause,
The Bretons, and the laws.
Let us dance, &c.

We'll remember long and sure
The *sans-culottes* of the *faubourg*:
Drink we merrily,
Dogs of liberty.
Let us dance, &c.

The singing and dancing of the Carmagnole became the signal of ferocious assaults on authority, and the expression of savage rejoicings over it. On any occasion of excitement on the streets, round the scaffold, even within the walls of the Convention, troops of sans-culottes would be seen circling round with beating feet to this tune, with faces full of dreadful meaning. The very prisoners whom suspicion condemned to the risk of a horrible death, no one could say how soon, would cheer themselves with the Carmagnole. '*Dansons le Carmagnole!*' were amongst the most familiar words known in Paris during at least a couple of years. Fashion appropriated the word, and applied it to a peculiar form of *blouse*, with wide sleeves, worn by the revolutionists, and all those who wished to make a show of their patriotism. Barrère, and some other members of the Convention, also gave the name of Carmagnoles to the measures passed by that body, and to some of the orations delivered from the parliamentary tribune in fanatical phraseology, having reference to the *veto* or opposition of the government, or to the victories of the army. The song and the new-fashioned garment both disappeared with the Reign of Terror.

Our readers may be curious to learn the history of a word so celebrated. Not far from the right bank of the Po, near the city of Turin, there lived, in the year 1405, a youth, aged fifteen, who had earned a good character as keeper of sheep on the farm where he was employed. No prowling wolf, driven by hunger from the hills, or roving man-at-arms, whose trade was war and rapine, had ever been able to elude his watchfulness. They had sometimes, it is true, set his courage at defiance, but with a result that made them repent of their temerity, until at last he was known throughout the country as 'the bold shepherd, Francesco Bartolomeo Bussone.'

During the time that Francesco was thus tending sheep, war broke out in Italy; a war of parties; and so eager was the struggle for supremacy, that the highways were infested by bands of *condottieri*, troops who hired themselves to the best paymaster, or to the chieftain most ready to accord them sack and pillage in the cities taken by storm. Facino Cane was one of those partisan leaders, who fought indifferently for Venice or Genoa, Milan or Turin, careless whether their banner bore the evangelical lion of St Mark, or the silver cross of Sardinia. At that time no person below the rank of a noble could rise to the command of regular troops; but to be a leader in the companies of Facino Cane, the only qualifications required were a wholesome contempt of danger, and such skill in strategy as might deceive an enemy or decide a victory.

Francesco was sleeping by the roadside on one of those evenings when, in Italy, the declining sun paints the sky in golden splendour, and the fleecy clouds glow with hues as of some far-off conflagration. A man passing by stopped, and commanded the young shepherd to rise; whereupon Francesco opened his eyes and rose to his feet. The stranger regarded him with a scrutinising eye, and said musingly, 'There is a man's stature.' 'And a man's heart,' rejoined Francesco, raising his arm to strike the intruder, who had roused him so unceremoniously. 'I am Facino Cane,' replied the connoisseur of bone and muscle; on hearing which the arm of the shepherd remained suspended for an instant, and then fell unnerved to his side. 'Yes, Facino Cane, who has risen from the ranks in the troops of Visconti, and made himself prince of Tortone and Verceil, because the world belongs to men of heart.' 'In that case,' answered Francesco, 'I have to demand my portion of inheritance from Italy.' 'Here is the key of your ducal castle,' added Facino, buckling a heavy sword to the young man's side, whose eyes sparkled as he followed the soldier-prince in his journeys over the country, recruiting his army with all those who, to the stature of a man, added the desire for military honours.

In 1424, the marriage of the Count of Castel Nuovo with Antoinette Visconti, niece of Philippe Marie, Duke of Milan, was celebrated in the capital of the duchy. The palace *del Broletto*, built for the newly wedded pair, resounded with festive songs; while the blazonry of escutcheons, hanging on the wainscotted walls of the hall of state, showed with what proud titles the sovereign duke honoured a subject in his royal alliance. One commemorated the taking of Placenza, another the surrender of Brescia, a third the siege of Bergami; on the other side the guests might read, Milan reconquered, and the reunion of Genoa to the ducal crown; while in the centre of a trophy rose, straight and glittering, the great sword given by Facino Cane to the shepherd Francesco Bartolomeo Bussone, become successively captain and general, under the name of Carmagnole; and afterwards, by the marriage now spoken of, count and nephew of the Duke of Milan.

Not long after, a man accused of having excited the enthusiasm of his soldiers, of having won the love of conquered people by his moderation in the hour of victory, and of having, in short, injured his master by his high position in the esteem and admiration of foreigners, was seen slowly following the road to Venice. He left behind him the immense wealth he had won, confiscated by the unjust avarice of his sovereign; and without knowing where to find a shelter, he carried nothing but the great sword of Facino Cane, and the ineffaceable glory associated with his name. It is said

that one evening, overcome with fatigue, he knocked at the door of a mean cottage, and being without the means of paying for a lodging, he ventured to mention a name proscribed by the law in support of his request for a shelter beneath the humble roof. The whole family fell at the feet of the great general. The women offered their tenderest cares, the men volunteered unlimited service, and a little child was named Felix Glorioso (Happy and Glorious) on the spot, from having touched, in his play, the hilt of the sword of Carmagnole.

In 1430, there was at Venice a general of fortune, whom princes even, in the service of the republic, considered it an honour to obey. Having escaped the dagger of an assassin, sent by Duke Philippe Marie of Milan, to acquit a debt of gratitude by a murder, the new Venetian general received from the hands of the doge, before the altar of St Mark, the standard and baton of commander, which assured to him the supreme authority over the armies and territory of Venice. This man, loaded with honours and riches, who extended every day the limits of the republic, and consolidated her power, was again Carmagnole.

The 5th of June 1432, the ministers of justice led a man bound and gagged between the two columns of the Piazetta of Venice. An assistant forced his head down upon the block which stood prepared, and the executioner, with one blow, struck off the head of the sufferer, already half dead with grief and torture. The crime publicly brought against him, was that of having permitted four hundred prisoners of war to return to the cultivation of their fields. The secret accusation was, however, having merited the confidence of the senate, without leaving any room to suspect his fidelity to the republic; and as his influence over the army could not be diminished without failing in the recompense due to him, he was made the victim of an unjust trial, under the impression that there was less of ingratitude in taking his life, than in the exhibition of distrust after all the services he had rendered.

Is it necessary to add that this man, whom tyranny doomed to a traitor's death, but whose whole life had been that of a hero, was the Sardinian shepherd boy, the companion of Facino Cane, the saviour of Duke Philippe Marie of Milan, the protector of Venice; in one word, Francesco Bartolomeo Bussone, surnamed Carmagnole?

It was originally to celebrate this popular hero that the song and dance of the Carmagnole took their rise in Piedmont in the fifteenth century. Strange with what different associations the name was to be afterwards invested.

NARRATIVE OF FREDERICK DOUGLASS.

We have been much interested in the autobiography of Frederick Douglass, a person of colour, lately a slave in the United States, and now a lecturer in the cause of abolition.* The account he gives of his early life, and the condition from which he was able to relieve himself, bears all the appearance of truth, and must, we conceive, help considerably to disseminate correct ideas respecting slavery and its attendant evils. Some of the passages present a dismal picture of what is endured by the negro race in the slave-holding states of the union.

Douglass was born on a plantation in Talbot county, Maryland, about the year 1808, his mother being a negro slave, and his father a white man—the proprietor of the estate, he has reason to believe. Soon after his birth he was placed under the charge of a negress too old for field labour, and his mother was hired out to a planter at twelve miles' distance. He then only saw her occasionally at night, when she could steal away to visit him for a brief space, in order to be back before sunrise, whipping being the penalty of any such unauthorised absence. The strength of the maternal feelings may be judged of from the fact of these visits to see her child. She would lie down and clasp him to her bosom for an hour or two, and then depart long ere daybreak to renew her labour in the fields. The poor woman died when her boy was seven years old, and it was long before he knew anything about it.

On the plantation of his uncompromising proprietor, the young slave passed the first years of his life. The principal products raised were tobacco, maize, and wheat, the labour of cultivating which was performed by bands of negroes under overseers, who strictly enforced every regulation with the whip. Having been put to attend on one of his master's sons, young Frederick escaped the more severe labour of the fields, and he had the satisfaction of being seldom whipped; but he tells us that he suffered much from hunger, cold, and other miseries. In hottest summer and coldest winter he was kept almost naked; no shoes, no stockings, no jacket, no trousers—nothing on but a coarse tow linen shirt, reaching only to the knees. Neither had he any bed; he lay on an earthen floor, on a sack or any other article he could conveniently secure. Along with the negro children, his companions, he fed at a trough placed on the ground; at these meals of boiled corn-meal, some used oyster-shells, others pieces of shingle, and some only their hands, in place of spoons; and he that ate fastest got most—the whole affair being like a scramble of monkeys.

When between seven and eight years of age, our hero was selected to act as a servant to a daughter of his master, who was married to a Captain Thomas Auld in Baltimore. This was a joyous rise in his condition. Being duly washed and scrubbed, he was installed for the first time in a pair of trousers, and felt himself already a new man. At Baltimore he was treated with unlooked-for kindness, and his duty was so far from being irksome, that it consisted only in taking care of his new master's son, little Thomas Auld. Mrs Auld did not entertain the usual notions respecting slavery, and was disposed to lighten the condition of the dark-skinned boy—she even began to teach him to read.

'Very soon after I went to live with Mr and Mrs Auld, she very kindly commenced to teach me the A B C. After I had learned this, she assisted me in learning to spell words of three or four letters. Just at this point of my progress, Mr Auld found out what was going on, and at once forbade Mrs Auld to instruct me further, telling her, among other things, that it was unlawful, as well as unsafe, to teach a slave to read. To use his own words, further, he said, "If you give a nigger an inch, he will take an ell. A nigger should know nothing but to obey his master—to do as he is told to do. Learning would *spoil* the best nigger in the world. Now," said he, "if you teach that nigger (speaking of myself) how to read, there would be no keeping him. It would forever unfit him to be a slave. He would at once become unmanageable, and of no value to his master. As to himself, it could do him no good, but a great deal of harm. It would make him discontented and unhappy." These words sank deep into my heart, stirred up sentiments within that lay slumbering, and called into existence an entirely new train of thought. It was a new and special revelation, explaining dark and mysterious things, with which my youthful understanding had struggled, but struggled in vain. I now understood what had been to me a most perplexing difficulty—namely, the white man's power to enslave the black man. It was a grand achievement, and I prized it highly. From that moment I understood the pathway from slavery to freedom. It was just what I wanted, and I got it at a time when I the least expected it. Whilst I was saddened by the thought of losing the aid of my kind mistress, I was gladdened by the invaluable instruction which, by the merest accident, I had gained from my master. Though conscious of the difficulty of learning without a teacher,

* Narrative of the Life of Frederick Douglass, an American Slave, written by himself. Dublin: Webb and Chapman. 1845.

I set out with high hope, and a fixed purpose, at whatever cost of trouble, to learn how to read.'

Inspired with this ardent wish, young Frederick took every opportunity to learn not only to read, but to write; and only succeeded by dint of many stratagems and much patience. 'The plan which I adopted (says he), and the one by which I was most successful, was that of making friends of all the little white boys whom I met in the street. As many of these as I could, I converted into teachers. With their kindly aid, obtained at different times and in different places, I finally succeeded in learning to read. When I was sent on errands, I always took my book with me, and by going one part of my errand quickly, I found time to get a lesson before my return. I used also to carry bread with me, enough of which was always in the house, and to which I was always welcome—for I was much better off in this regard than many of the poor white children in the neighbourhood. This bread I used to bestow on the hungry little urchins, who, in return, would give me that more valuable bread of knowledge. I am strongly tempted to give the names of two or three of those little boys, as a testimonial of the gratitude and affection I bear them; but prudence forbids; not that it would injure me, but it might embarrass them, for it is almost an unpardonable offence to teach slaves to read in this Christian country!'

Being now able to read, he had obtained a key by which he could open the treasures of knowledge hidden to the poor unlettered negro population. But the gift of learning brought with it depressing considerations. The thought of being a slave for life bore heavily on his heart; and while yet only twelve years of age, he began to inquire of himself how it should be the fate of some men to be slaves and others freemen. This very puzzling question was at length cleared up by his perusal of a book entitled 'The Columbian Orator,' which he chanced to get hold of. At every opportunity he read this book, in which, says he, 'I found among much interesting matter, a dialogue between a master and his slave. The slave was represented as having run away from his master three times. The dialogue exhibited the conversation which took place between them, when the slave was retaken the third time. In this dialogue the whole argument in behalf of slavery was brought forward by the master, all of which was disposed of by the slave. The slave was made to say some very smart as well as impressive things in reply to his master—things which had the desired though unexpected effect, for the conversation resulted in the voluntary emancipation of the slave on the part of the master. In the same book I met with one of Sheridan's mighty speeches on and in behalf of Catholic emancipation. These were choice documents to me. I read them over and over again with unabated interest. They gave tongue to interesting thoughts of my own soul, which had frequently flashed through my mind, and died away for want of utterance. The moral which I gained from the dialogue was the power of truth over the conscience of even a slaveholder. What I got from Sheridan was a bold denunciation of slavery, and a powerful vindication of human rights. The reading of these documents enabled me to utter my thoughts, and to meet the arguments brought forward to sustain slavery; but while they relieved me of one difficulty, they brought on another even more painful than the one of which I was relieved. The more I read, the more I was led to abhor and detest my enslavers. I could regard them in no other light than a band of successful robbers, who had left their homes, and gone to Africa, and stolen us from our homes, and in a strange land reduced us to slavery. I loathed them as being the meanest as well as the most wicked of men. As I read and contemplated the subject, behold that very discontentment which master had predicted would follow my learning to read had already come, to torment and sting my soul to unutterable anguish.'

While in this state of mind, he heard something of the abolition movement in the northern states. 'I went one day down to the wharf; and seeing two Irishmen unloading a scow of stone, I went unasked and helped them. When we had finished, one of them came to me and asked me if I were a slave. I told him I was. He asked, 'Are you a slave for life?' I told him that I was. The good Irishman seemed to be deeply affected by the statement. He said to the other that it was a pity so fine a little fellow as myself should be a slave for life. He said it was a shame to hold me. They both advised me to run away to the north; that I should find friends there, and that I should be free. I pretended not to be interested in what they said, and treated them as if I did not understand them; for I feared they might be treacherous. White men have been known to encourage slaves to escape, and then, to get the reward, catch them and return them to their masters. I was afraid that these seemingly good men might use me so; but I nevertheless remembered their advice, and from that time I resolved to run away.'

Meanwhile he learned to write, beginning by imitating the letters chalked on the timber in a ship-building yard. 'After that, when I met with any boy who I knew could write, I would tell him I could write as well as he. The next word would be, 'I don't believe you. Let me see you try it.' I would then make the letters which I had been so fortunate as to learn, and asked him to beat that. In this way I got a good many lessons in writing, which it is quite possible I should never have gotten in any other way. During this time my copy-book was the board-fence, brick wall, and pavement; my pen and ink was a lump of chalk. With these I learned mainly how to write. I then commenced and continued copying the italics in Webster's Spelling-Book, until I could make them all without looking on the book. By this time my little master Thomas had gone to school, and learned how to write, and had written over a number of copy-books. These had been brought home, and shown to some of our near neighbours, and then laid aside. By copying these, I finally succeeded in learning how to write.'

After various turns in his condition, he was, by the death of his owner in 1832, transferred to Mr Thomas Auld at St Michael's, where he was exposed to much harsh treatment. This new proprietor affected to be more than usually devout; but this, to the surprise of Frederick, neither made him more humane to his slaves, nor led him to emancipate them. 'Prior to his conversion, he relied upon his own depravity to shield and sustain him in his savage barbarity; but after his conversion, he found religious sanction and support for his slaveholding cruelty. He made the greatest pretensions to piety. His house was the house of prayer. He prayed morning, noon, and night. He very soon distinguished himself among his brethren, and was soon made a class-leader and exhorter. His activity in revivals was great, and he proved himself an instrument in the hands of the church in converting many souls. His house was the preachers' home. They used to take great pleasure in coming there to put up; for while he starved us, he stuffed them.'

Neither the religious nor the intellectual culture of the slaves on the establishment troubled this set of worthies; they in fact set their faces against any improvement in the condition of these unfortunate beings. A young man having collected the negroes together on the Sunday evenings to teach them to read the New Testament, the school was broken up by an irruption of the leaders of the class-meetings, armed with sticks and other missiles. 'I have said my master found religious sanction for his cruelty. As an example, I will state one of many facts going to prove the charge. I have seen him tie up a lame young woman, and whip her with a heavy cowskin upon her naked shoulders, causing the warm red blood to drip; and, in justification of the bloody deed, he would quote this passage of Scripture—"He that knoweth his master's will, and doeth it not, shall be beaten with many stripes." Master would keep this lacerated young woman tied up in this horrid situation four or five hours at a time. I have known him to tie her up early in the morning and

whip her before breakfast; leave her, go to his store, return at dinner-time, and whip her again, cutting her in the places already made raw with his cruel lash.'

Frederick did not please his master, who alleged he had been spoiled by a city life; and, to bring him in as a good field hand, he was transferred for a term to Mr Covey, a great professor of religion, and a person reputed for his abilities as a 'nigger breaker.' He had been at this new home only a week, when he committed the unpardonable crime of allowing a team of oxen with a dray to break away from him in the woods. Catching the animals after several hours' toil, and returning home, he tells Mr Covey what had happened. 'He ordered me to return to the woods again immediately. I did so, and he followed on after me. Just as I got into the woods, he came up and told me to stop my cart, and that he would teach me how to trifle away my time, and break gates. He then went to a large gum-tree, and with his axe cut three large switches, and, after trimming them up neatly with his pocket-knife, he ordered me to take off my clothes. I made him no answer, but stood with my clothes on. He repeated his order. I still made him no answer, nor did I move to strip myself. Upon this he rushed at me with the fierceness of a tiger, tore off my clothes, and lashed me till he had worn out his switches, cutting me so savagely as to leave the marks visible for a long time after. This whipping was the first of a number just like it, and for similar offences. I lived with Mr Covey one year. During the first six months of that year, scarce a week passed without his whipping me. I was seldom free from a sore back. My awkwardness was almost always his excuse for whipping me. We were worked fully up to the point of endurance. Long before day we were up, our horses fed, and by the first approach of day we were off to the field with our hoes and ploughing teams. Mr Covey gave us enough to eat, but scarce time to eat it. We were often less than five minutes taking our meals. We were often in the field from the first approach of day till its last lingering ray had left us; and at saving fodder-time, midnight often caught us in the field binding blades. Made to drink the bitterest dregs of slavery, Mr Covey succeeded in breaking me. I was broken in body, soul, and spirit. My natural elasticity was crushed, my intellect languished, the disposition to read departed, the cheerful spark that lingered about my eye died, the dark night of slavery closed in upon me; and behold a man transformed into a brute! Sunday was my only leisure time. I spent this in a sort of beast-like stupor, between sleeping and waking under some large tree. At times I would rise up, a flash of energetic freedom would dart through my soul, accompanied with a faint gleam of hope that flickered for a moment and then vanished. I sank down again, mourning over my wretched condition. I was sometimes prompted to take my life and that of Covey, but was prevented by a combination of hope and fear. My sufferings on this plantation seem now like a dream rather than a stern reality.'

We must pass over some distressing details which follow, and take up the narrative of our hero in January 1834, on his removal from Mr Covey to the establishment of Mr William Freeland, a person of a more generous disposition, and without any pretensions on the score of religion. 'This, in my opinion (says Frederick), was truly a great advantage. I assert most unhesitatingly, that the religion of the south is a mere covering for the most horrid crimes, a justifier of the most appalling barbarities, a sanctifier of the most hateful frauds, and a dark shelter under which the darkest, foulest, grossest, and most infernal deeds of slaveholders find the strongest protection. Were I to be again reduced to the chains of slavery, next to that enslavement I should regard being the slave of a religious master the greatest calamity that could befall me. For of all slaveholders with whom I have ever met, religious slaveholders are the worst. I have ever found them the meanest and basest, the most cruel and cowardly of all others.' Of course, in making these observations, our author wishes to guard his readers against the notion that true piety is an enemy of freedom and justice; he only means to show how religion is employed as a cloak for every iniquity in the southern states of the union.

Freeland was a humane master, and at the end of the year 1834, Frederick had the satisfaction of being hired by him from his proprietor for one year longer. This permitted him to devote some little leisure time to the cultivation of his mind, and the instruction of the negroes with whom he lived. Along with two of these he contrived a plan of escape, to be aided by passes, which he had the ability to write. The runaways were, however, taken; and after confinement in jail, our hero, very much downcast, was sent to labour in a shipbuilder's yard in Baltimore. Here he was shockingly abused by the white workmen, and on one occasion was so much beaten that he had to be removed; and after this, for some time, he was permitted to hire himself out, on the condition that all he made by his labour should be paid over weekly to his owner. 'In the early part of the year 1838 I became quite restless. I could see no reason why I should, at the end of each week, pour the reward of my toil into the purse of my master. When I carried to him my weekly wages, he would, after counting the money, look me in the face with a robber-like fierceness, and ask, "Is this all?" He was satisfied with nothing less than the last cent. He would, however, when I made him six dollars, sometimes give me six cents, to encourage me. It had the opposite effect. I regarded it as a sort of admission of my right to the whole. The fact that he gave me any part of my wages was proof, to my mind, that he believed me entitled to the whole of them. I always felt worse for having received anything, for I feared that the giving me a few cents would ease his conscience, and make him feel himself to be a pretty honourable sort of robber.' Discontent at this as well as every other mode of coercion, at length, in September 1838, induced Frederick to attempt once more his escape, in which if he failed, he might reckon on the severest punishment, besides being placed effectually beyond the means of any fresh effort at freedom. Fortunately he laid his plans so well that he succeeded in reaching New York without interruption. The more effectually to escape detection, he changed his name. Hitherto he had borne his mother's name Bailey, which he changed to Johnson on leaving Baltimore; and this he afterwards dropped, to take that of Douglass. At New York he was joined by a young woman from Baltimore, to whom he was united in marriage. The newly-married pair, not thinking themselves safe in this great city, went to New Bedford, a sea-port in Massachusetts. Here the extent of shipping and proofs of wealth astonished him. 'Added to this, almost everybody seemed to be at work, but noiselessly so, compared with what I had been accustomed to in Baltimore. There were no loud songs heard from those engaged in loading and unloading ships. I heard no deep oaths or horrid curses on the labourer. I saw no whipping of men; but all seemed to go smoothly on. Every man appeared to understand his work, and went at it with a sober yet cheerful earnestness, which betokened the deep interest which he felt in what he was doing, as well as a sense of his own dignity as a man. To me this looked exceedingly strange. From the wharfs I strolled around and over the town, gazing with wonder and admiration at the splendid churches, beautiful dwellings, and finely-cultivated gardens; evincing an amount of wealth, comfort, taste, and refinement, such as I had never seen in any part of slaveholding Maryland.'

On the third day after his arrival he procured employment on the wharfs, there being no work too hard or too dirty which he did not gladly undertake. 'I was ready to saw wood, shovel coal, carry the hod, sweep the chimney, or roll oil casks, all of which I did for nearly three years in New Bedford before I became known to the anti-slavery world.' Having accidentally been led to speak of slavery at a meeting of abolitionists, he seemed to have at length alighted on his proper vocation; and from that time until now he has been engaged in publicly pleading the cause of his unfortunate brethren.

On his quitting America for Europe, a meeting of per-

sons friendly to emancipation took place at Lynn, Massachusetts, where he had resided for the last two years, and unanimously passed the following resolution in his favour:—'That we are especially desirous that Frederick Douglass, who came to this town a fugitive from slavery, should bear with him to the shores of the old world our unanimous testimony to the fidelity with which he has sustained the various relations of life, and to the deep respect with which he is now regarded by every friend of liberty throughout our borders.' Mr Douglass is now we believe in Great Britain, lecturing on the subject of slavery, and we should suppose few could be more capable of depicting the horrors of that great national iniquity.

ASCENT OF THE WETTERHORN.

The Wetterhorn, or Peak of Tempests, in the canton of Berne, is one of those lofty seats of perennial snow which used to be considered as defying the foot of man to approach their summits. A few years ago, the Jungfrau, one of these peaks, was ascended by a party, including our countryman, Professor Forbes of Edinburgh. More recently, three Swiss naturalists surmounted the Shreckhorn, or Peak of Terror, leaving a flag flying on the summit, to the wonder of chamois-hunters and guides. Since then—in the summer of the past year—a young English gentleman, named Speer, accomplished the ascent of the Wetterhorn, which, like the Shreckhorn, had been deemed utterly inaccessible. And this was the more remarkable as an enterprise, that it was performed fully a month earlier in the season than any other of the great ascents of the same character. Under the sanction of Mr Speer, we here abridge a narrative of his adventure, which he drew up immediately after its conclusion, and which has already appeared in a periodical work of more limited circulation than the present.

Having first reached the Grimsel, a height of 6570 feet, on the southern slope of the great chain of the Bernese Alps, 'a conversation,' says Mr Speer, 'was held between the host (a hardy old mountaineer), myself, and three of the guides, as to the proceedings to be adopted, and also as regarded the probable result of the undertaking. This terminated satisfactorily. Two of the boldest, J. Jaun and Caspar Alphamalph, volunteered to accompany me, and as both one and the other had trodden the summit of the Jungfrau, I instantly placed all confidence in them; and leaving them in company with my former guide to prepare for our expedition, I retired early, knowing that the ensuing night would necessarily be spent on the glacier of the Aar—a locality not very favourable to repose. The morning broke without a cloud, and I found the three mountaineers fully equipped with hatchets, ropes, crampons, long poles shod with iron, blue veils, &c. not forgetting provisions for two days, and the flag which we fondly hoped should bear testimony of the forthcoming exploit. On leaving the Grimsel, our course lay among fallen rocks, up a desolate valley, bounded on the left by the Leidelhorn, and on the right by the Juchliberg and the Bruniberg. This valley (situated about 7000 feet above the Mediterranean) appeared gradually to enlarge, and we perceived its further extremity to be closed from side to side by a wall of dingy-looking ice, rising vertically between two and three hundred feet in height: this was the termination of the glacier of the Aar. Having attained the summit of this wall, by scaling the rocks on its border, we perceived the vast glacier of the Aar itself spread out before us for many miles, and surrounded by the gigantic peaks of the Finsteraarhorn, Shreckhorn, Oberaarhorn, Vischerhorner, and Lauteraarhorn, the former rising to the height of 14,000 feet; the remainder ranging between 11,000 and 13,000 feet above sea-level. Following the course of the terminal moraine, we reached the pure unsullied surface of the glacier itself, which we now found thickly spread with crevasses, all running parallel with each other: the majority of these being filled with snow, considerable caution was necessary in sounding them with the poles, previous to trusting the body to so frail and deceptive a support. Proceeding thus along the centre of the glacier for three hours, we arrived opposite the little hut constructed for M. Agassiz, in order to enable him to carry out more fully his experiments on the increase and advance of the glaciers. Situated fully 300 feet above the level of the ice, it is in a great measure sheltered from the fall of avalanches and from the effects of those hurricanes and snow-storms to which these elevated regions are so liable. The sun was now gradually declining, the innumerable ice-bound peaks and glaciers being lit up by its last rays, until the whole chain presented the appearance of burnished gold. This magnificent spectacle suddenly ceased, and every object resumed its ghastly bluish tinge, as the shades of night shut them out from our view, merely leaving the white outline of the nearer peaks discernible.

'We now attempted to obtain a few hours' sleep, after taking every possible precaution to guard against the severe cold: in this latter we partially succeeded. Sleep, however, was tardy in its approaches, the novelty of the situation being too exciting. Towards midnight several vast avalanches fell, with the roar of the loudest thunder, on the opposite side of the glacier. This was quite sufficient to banish all drowsy sensations; we were soon, therefore, on foot, preparing in earnest for the anticipated seventeen hours of successive climbing over snow and glacier. The first point to be accomplished was the descent to the surface of the glacier, into the recesses of which (owing to its disrupted condition) we found it necessary to penetrate, finding ourselves at the bottom of a well, round three sides of which walls of ice rose almost vertically. Up these walls it was necessary to ascend, in order to effect our exit from our cold dismal prison. Jaun, our *guide chef*, commenced cutting out steps in the ice, and in a short time we all emerged from our retreat, and stood safely on the glacier of the Lauteraar, at its junction with that of the Finsteraar. The former descends from the Shreckhorn and Col de Lauteraar; the latter from the Finsteraarhorn and its attendant peaks.

'Our course was now directed across the glacier towards the Abschwung, along the base of which we cautiously proceeded, the ice at this early period being dangerously slippery. The doubtful crevasses were sounded, and the yawning ones avoided as far as possible. These at length (on our attaining an elevation of 9000 feet) ceased in a great degree, and the surface of the glacier appeared covered for miles in extent with a thick coat of unsullied and unbroken snow; whilst in front of us, and fully three hours' march distant, rose the Col de Lauteraar, 10,000 feet in height, hitherto considered impracticable. Its brilliant white crest being cut out in the strongest relief against the deep blue sky, tempted us into the belief that it was close at hand: we soon, however, became aware of our inability to calculate distances in regions where the vast size of the surrounding objects, combined with the peculiar light reflected from the snow and glaciers, baffle any such attempt. For hours we continued surmounting long slopes of snow, sinking at every step half-way to the knee; and as yet no visible decrease of distance appeared. At length we reached the first range of those great crevasses usually found at the foot of the steepest ascents: among these it was necessary to proceed with the utmost caution: the whole party were lashed together, and we threaded our way through this labyrinth of blue and ghastly abysses to the very foot of the redoubted Col de Lauteraar, which now rose quasi-perpendicularly far above our heads for many hundreds of feet, whilst on its ridge we perceived a mass of overhanging snow, which, from its threatening aspect, caused us great uneasiness; in fact, a more formidable or apparently inaccessible barrier could scarcely be witnessed. It was, nevertheless, necessary to surmount it, and the question now was, how is it to be done? At our feet lay a large crevasse, on the opposite side of which the wall of snow rose immediately, not leaving the smallest space on which to place the foot. Our head guide, however, nothing daunted, by means of his long alpenstock succeeded in excavating a hole in the snow, into which we might jump without much danger of falling into the yawning gulf below: he first crossed, and extending his baton to assist the next comer, I seized the

friendly aid, and jumped. The snow, however, gave way, and I remained suspended over the abyss, grasping with all my strength the extended pole: from this perilous position I was instantly rescued; and the rest of the guides having crossed in safety, we found ourselves clinging to the wall of snow which constitutes the southern aspect of the Col.

'The ascent now commenced in earnest, the first guide having been relieved by the second in command, who (hatchet in hand) assiduously dashed holes in the snow in which to place the hands and feet. The steepness of the Col being such, that the necessary inclination of the body forwards, which all ascents require, brought the chest and face in close contact with the snow, the excessive brilliancy of which, notwithstanding our blue glasses and veils, proved singularly annoying. In this critical position, our progress upwards was of necessity very slow, the advance of the foot from one step to the succeeding one being a matter of careful consideration, as a slip, the least inclination backwards, or even giddiness, must inevitably have proved fatal to one or other of the party. Thanks, however, to the efforts of the hardy mountaineers, the summit of the Col was at length attained, five hours after our departure from the night encampment. For some time previous, our sphere of vision had necessarily been limited by the interposition of the Col de Lauteraar; its crest, however, being attained, we beheld a great portion of Switzerland stretched out like a map far below, whilst on either side rose the summits of those gigantic barriers which bound the valley of Grindelwald. On the left the great and little Shreckhorn and the Mettenberg, and on the right the object of our ambition, the three peaks of the Wetterhorner, the Wetterhorn, the Mittalhorn, and Rosenhorn: below us lay the fields of snow which descend from these summits, and crown the superior glacier of Grindelwald.

'It was now deemed necessary to descend a portion of the opposite side of the Col we had just surmounted, previous to arriving at the foot of the great peak, which appeared to rise in close proximity to the height of 2150 feet above the plateau of snow on which we stood, and which in itself attained an elevation of 10,000 feet. We now began our descent, which, although not so steep as our previous ascent, was perhaps more terrifying, the precipices of ice and snow, together with the wide crevasses thickly spread at their feet, being constantly before the eyes. Great stress being laid on the ropes and hatchets, this descent was in turn safely accomplished, and we again began to ascend slope after slope of snow (at times threading our way with much difficulty among the gaping crevasses, all of which presented the appearance of the deepest azure), our course being directed towards the base of the superb central peak known as the Mittalhorn, which now towered above our heads; apparently a huge pyramid of the purest ice and snow. To me it appeared so impossible to scale it, that I ventured to inquire of the guides whether they expected to attain the summit; to this they replied, that they assuredly did so. I therefore held my peace, thinking myself in right good company, and the south-western aspect of the peak being deemed, to all appearance, the most practicable, we began the arduous task of scaling this virgin mountain. The ascent in itself strongly resembled that of the Col de Lauteraar described above: its duration, however, being longer, and the coating of ice and snow being likewise more dense, the steps hewn out with the hatchet required to be enlarged with the feet preparatory to changing our position. In this singular manner we slowly ascended, digging the left hand into the hole above our heads, left by the hatchet of the advancing guide, and gradually drawing up the foot into the next aperture; the body reclining full length on the snow between each succeeding step. In this truly delectable situation our eyes were every moment greeted with the view of the vast precipices of ice stretching above and below; impressing constantly on our mind the idea that one false step might seal the fate of the whole party: connected as we were one to the other, such in fact might easily have been the case. We had now been three hours on the peak itself, and the guides confidently affirmed that in another hour (if no accident occurred) we should attain the summit: the banner was accordingly prepared, and after a few minutes' repose, taken by turning cautiously round, and placing our backs against the snow, we stretched upwards once more, the guides singing national songs, and the utmost gaiety pervading the whole party at the prospect of so successful a result. The brilliant white summit of the peak appeared just above us, and when within thirty or forty feet of its apex, the *guide chef*, considerately thinking that his employer would naturally wish to be the first to tread this unconquered summit, reversed the ropes, and placing me first in the line, directed me to take the hatchet and cautiously cut the few remaining steps necessary. These injunctions I obeyed to the best of my abilities, and at one o'clock precisely the red banner fluttered on the summit of the central peak of the Wetterhorn.

'We had thus, after three days' continual ascent from the level of the plain, attained a height of 12,154 feet. Up to this period our attention had been too much occupied in surmounting the opposing obstacles which lay in our route, to allow us to contemplate with attention the astonishing panorama which gradually unfolded itself. The summit being under our feet, we had ample leisure to examine the relative position of the surrounding peaks, the greater portion of which appeared to lie far beneath us. To the north we perceived the Faulhorn and the range of mountains skirting the lake of Brienz; behind these the passage of the Brunig, together with the lakes of Lungerne and Lucerne, on the banks of which rise the pyramids of the Righi and the Mont Pilate, the summits of which (the boast of so many tourists) appeared as mole-hills. Towards the east the eye wanders over an interminable extent of snow-clad summits, extending to the utmost verge of the horizon—a perfect ocean of mountains. Turning to the south, however, we there perceive the monarchs of these Bernese Alps rising side by side: the Rosenhorn and Berglistock raise their snow-clad crests in close proximity; separated from them by the Col de Lauteraar, we perceived the rugged Shreckhorn, aptly denominated the Peak of Terror; whilst the loftiest of the group, the Finsteraarhorn, appears peering among his companions. To the right of these two peaks the brilliant Vischerhorner next came into view, beyond which we discover the three celebrated sister summits of the Eiger, the Mounch, and the Jungfrau; the whole group exceeding the height of 12,000 feet. At the base of these gigantic masses lies the Wengern Alp, apparently a mere undulation; whilst far below, the outline of the village of Grindelwald may be faintly discerned, the river Lutchinen winding, like a silver thread, through the valley. On all sides of the peak on which we now stood (on the summit of which a dozen persons could scarcely assemble) we beheld vast glittering precipices; at the foot of these lie the plains of snow which contribute to the increase of the numerous glaciers, situated still lower; namely, to the left the superior glacier of Grindelwald and that of Lauteraar, to the right the glaciers of Gauli, of Reufen, and of Rosenlaui, out of which rose the peaks of the Wellhorn, the Tosenhorn, and Engelhorner.

'Many anxious looks were now cast in this direction; the guides having determined to reach Rosenlaui through this unexplored region. We had remained above twenty minutes on the summit, exposed to a violent wind and intense cold; although in the plain, on that day, the thermometer of Fahrenheit stood at 93 degrees in the shade. The sudden appearance of a few fleecy clouds far below caused us some misgivings; we therefore (after firmly securing the flag-staff) commenced our descent on the opposite side of the peak to that by which we had ascended, in order to reach the plains of snow surmounting the great glacier of Rosenlaui. From the excessive steepness of this slope, and the absence of crevasses, it was deemed advisable to sit and slide down the snow, guiding our course with the poles. In this manner we descended with the greatest rapidity to the plateau. Here again great caution was required, many of the crevasses being covered with a slight coating of fresh snow, incapable of

sustaining the weight of the human body. After crossing this plateau, we arrived at the foot of the Tosenhorn. This is a lofty peak, situated at the junction of the glaciers of Rosenlaui and Reufen, which at this point become identified with the great slope of snow descending from the Wetterhorner. This region being a *terra incognita* like the preceding, our advance was slow and wavering; and on the descent of the Tosenhorn, the difficulties appeared rather to increase than diminish—the loose rocks and stones covering the southern aspect of the peak, receding continually from under the feet and falling in showers over the precipice; below which, at a fearful depth, we could discern the deep blue crevasses and bristling minarets of the glacier of Rosenlaui. Quitting the rocks, we again found ourselves on slopes of snow so vertical, that for a long period of time it was necessary to descend backwards, as if on a ladder, the hatchet being in full play. At the foot of one of these slopes the snow broke suddenly away, leaving a crevasse apparently about four yards in width, the opposite border of which was fully twenty feet lower than that on which we stood. This at first sight appeared insurmountable, the guides themselves being bewildered, and all giving advice in one breath. We were at this time clinging to the slope of snow, over the very verge of the blue gulf below. Jaun at length volunteered the hazardous experiment of clearing it at a bound: this he accordingly did, arriving safely on the inferior border. The ropes being detached, the remainder of the party mustered resolution, and desperation giving fresh courage, we all in turn came flying across the crevasse upon the smooth snow below. Our successful triumph over this alarming obstacle having greatly inspirited us, we prepared to cross a narrow slope of ice, on which our leader was diligently hacking a few steps. A sudden rumbling sound, however, arrested our attention; the rear guides drew the rest back with the ropes with violence, and the next moment an avalanche thundered down over the slope we had been preparing to cross, leaving the whole party petrified with horror at the narrowness of their escape. The clouds of fine snow in which we had been enveloped having subsided, we again descended, during three hours, a succession of steep walls of ice and snow, reaching the glacier of Rosenlaui at five o'clock P.M. The passage of this glacier resembles in every respect that of the far-famed Glacier de Bossons on the Mont Blanc, the crevasses being so numerous as to leave mere ridges of ice interposed between them; and these ridges being the only means of progress, the eye was constantly exposed to the view of the surrounding gulfs of ice which at every step appear ready to swallow up the unfortunate individual whose presence of mind should fail, whilst the pinnacles of ice rising overhead often totter upon their unsteady foundations. In our present fatigued condition, the passage of the glacier was indeed highly perilous. The extreme caution and courage of the guides fortunately prevented the occurrence of any serious accident, and at eight P.M. we bade a final adieu to those fields of snow and ice-bound peaks over which our course had been directed for seventeen consecutive hours. All danger was now past, and the excitement having ceased, the tedious descent over rocks and fallen pines became insufferably fatiguing. The baths of Rosenlaui were still far below at our feet, whilst the sombre hue of the pine forests, stretching down into the valley, formed a striking contrast to the uninterrupted glare of so many previous hours. Night was now gradually throwing its veil over the surrounding objects; the glimmering of lights soon became visible; and at nine P.M. we all arrived safely at the baths of Rosenlaui, where for several hours considerable excitement had prevailed—the flag fluttering on the summit of the peak having been discovered by means of a powerful telescope. Four small dots had likewise been noticed at an immense height on the otherwise unsullied snow, which dots having been likewise seen to change their position, the inhabitants of the valleys wisely concluded that another of their stupendous mountains was in a fair way of losing its former prestige of invincibility.

'On the following morning I took leave of the two intrepid chamois hunters, to whom on several occasions during the previous eventful day I had owed my preservation. I was shortly afterwards informed that these poor fellows, though so hardy, were confined by an illness arising from the severity of their late exploit. For myself, I escaped with the usual consequences of so long an exposure to the snow in these elevated regions; namely, the loss of the skin of the face, together with inflammation of the eyes, and, accompanied by my remaining guide, who was likewise in a very doleful condition, we recrossed the Great Shiedeck, arriving at Interlacken the 10th of July.'

FIRESIDE CHIT-CHAT.

NO. II.

Stukely.—You have been in the north lately, I think: did you come or go by way of Edinburgh?

Gilaroo.—Yes; what of that?

Stuke.—Oh, only I wished to know if you chanced to see a particularly splendid edifice, in the old English style, getting up near Edinburgh—the finest building, I believe, now erecting in the United Kingdom; will cost, I am told, something like a hundred thousand pounds.

Gil.—Well, I think I do recollect something of the sort; some nobleman's residence, I suppose; a splendid situation it occupies, west of the town.

Stuke.—Quite right as to situation, but wrong as to its objects. Why, it is an hospital for educating and boarding poor children—a munificent endowment of an old printer named Donaldson, who died some twenty years ago. There are so few instances of such considerate benevolence, that one cannot but honour the memory of so good a man.

Gil.—Avast there, as Tom Pipes would say. Considerate benevolence with a vengeance! More likely a piece of vanity in the old gentleman. Does it not strike you that this practice of rearing poor children by the hundred in magnificent palaces, quite at variance with their prospects in life, is exceedingly absurd? If the wish were to rear monks, I could understand the principle of the thing; but why children who are to mix in the world should be taken from under their parents' direction and culture, and brought up in seclusion in large houses, where they have neither industrial exercises nor domestic training, and at best only get some book instruction, is past my comprehension.

Stuke.—You surprise me. I always thought these hospitals among our most admirable institutions. The benefits they confer by relieving parents in meagre circumstances from the great cost of educating children, are too well known for me to say anything about them.

Gil.—A mistake, my dear fellow—all a mistake. You are wandering in the dark ages of twenty years ago. Since that remote period, the world has got quite new lights on the subject of rearing and educating children; and, what you will think curious, they have gone back to nature for principles. It is now a settled point—that is, settled among all but the no-reading, no-thinking very respectable personages who go on dreaming of the past—that children can never be so well brought up as within the pale of the institution pointed out by nature—to wit, the family home, or at least in private educational establishments in which something like fireside training—the training of the affections—has a place.

Stuke.—Then what would you do with all the endowed hospitals for youth?

Gil.—Either turn them into day schools, or infuse into them the principles of an education which would develop the whole faculties and feelings of the pupils. Some might be advantageously abolished, and their funds devoted to general purposes of education.

Stuke.—You would not certainly meddle with hospitals for the aged and infirm?

Gil.—Not quite sure. I rather think that, in most instances, endowed almshouses, asylums, and all that kind of thing, are got up very much as monuments of posthumous vanity. However, that is neither here nor

there as to the main question. The worst feature of these institutions is, that the people who go into them must feel, to a certain extent, that they are pauperised —that they are objects of a bounty doled out in the eye of the public. Now, I would prefer sheltering them from this indignity. Instead of cramming a lot of old men and women into a big house, called an asylum, or into a row of small edifices, called almshouses, I would give each poor person an allowance of so much per annum to go and live where he liked. His pittance might be of consequence in providing a decent home in the house of a brother, sister, or other relative; or he might select a cheap place of residence in the country, visit his friends occasionally, and perhaps eke out his income by some trifling employment. Among the other advantages of this plan, there would be a saving of a house, also of salaries to governors, physicians, chaplains, domestics, door-keepers, and so forth. I see it mentioned in the newspapers, that the late Sir Gabriel Wood has bequeathed the princely sum of L.30,000, to be expended in the erection and maintenance of an hospital in Greenock for the reception of the aged, infirm, and disabled seamen of that port. This bequest will doubtless do much good; but it would do a great deal more if the cost of erecting and maintaining a fine mansion—perhaps an eight or ten thousand pound affair —were not to be abstracted from it.

Stuke.—You do take such queer notions.

Gil.—Perhaps so; I don't insist on my plan being the right one in all cases. There is no rule, you know, without exceptions; I would only have the subject reconsidered by those who think of leaving money for beneficent purposes. The subject indeed has another side: it may be a question whether bequeathed money ever does the good expected from it, leave it any way you like. Whereas, if men were to be liberal during their lives, instead of after death, they would not only make sure of doing good in a right direction, but reap all the pleasure of being benevolent. Is there not something melancholy in contemplating the death of the unfriended rich? Picture to yourself an old wealthy man, for whom no one entertains either respect or affection; see him reclining on his death-bed, with no single consolation but that of owning fifty thousand pounds. But what if it were fifty times fifty thousand? It can give no new lease of existence, allay no pain in his condition, purchase no real pleasure, ensure no happiness. Its possession is probably a trouble: how he should leave it is an annoyance. After pondering on all sorts of schemes, he fastens on the idea of endowing an hospital; and this becomes to him a kind of substantiality in his dreams; as he sinks unfriended to his rest, the vision of a building which shall rise a proud memorial of his charity floats in his dying brain. Well, at length the building is erected, but before the last stone of it is laid, the testator is a mass of clay, and nobody thanks him for his alms. He cheated himself with a fancy. 'Can flattery soothe the dull cold ear of death?'

Stuke.—Very gloomy view of affairs I must confess; why, what would you be at?

Gil.—I only want to see people act with a little foresight, and do their duty while they may. Have you ever read Carlyle's Past and Present?

Stuke.—Yes—no: I have tried; but it is too mystic and high-flown for my poor faculties.

Gil.—Carlyle is seldom anything but mystic. It is *in* him, I suppose, and he cannot help it. Yet in his mysticism there are often gleams of strong original thought. I like originality. I like to see men think for themselves, and not go droning on upon the same set of tunes, like a barrel organ, generation after generation. Carlyle is one of these dashing original thinkers and writers. He tells his mind, and that I take to be a great point. He also tells people pretty freely as to their failings. One of his sayings struck me: it is 'that every man should *find his work, and do it.*'

Stuke.—I see nothing in that; everybody is bound to follow his calling.

Gil.—That's just what I expected you would say. Carlyle's meaning goes deeper than a man's professional labours. He implies that every one among us should cast about for some kind of work in which he can make himself useful to his fellow-creatures. One man has a gift for this, another has a gift for that; one can give much valuable assistance, for example, as to the getting up a useful class of schools, and another can be of material service in improving the health of towns. Sometimes the 'work' may consist in only giving a little countenance and advice; at other times it may depend on personal exertions; in another class of cases it may be necessary to expend some money; and at the very least it will consist in giving good wishes and no opposition towards schemes of general benefit, which the more enterprising are willing to undertake. The other day I heard of a case in point:—A gentleman and his wife, without family, and having a fortune equal to their wants and wishes, became tired of living in London, where they had little else to do but amuse themselves. Reflecting on how they could lead a life not only more useful, but more agreeable to their feelings, they resolved on removing to the west of Ireland—the last place which most people in their rank would have thought of. They removed thither accordingly, took a house in a poor village, and commenced a career of active benevolence. Not discouraged by accounts of others having failed to improve the condition and habits of the Irish peasantry, they set about a persevering course of social melioration. For one thing, they established a school for teaching girls sewing and household work; and it is amazing what good this in time effected. Formerly, the people in the village and neighbourhood had gone about in rags; the women seldom mended anything, and the cottages were dirty and wretched. Now, not a torn or ragged garment was to be seen; buttons were sewed on as soon as they fell off, and the clothing generally exhibited quite an altered appearance. The houses also were better kept; pigs were turned out of doors; and the firesides had for the first time an air of neatness and comfort. All this of course took some years of incessant labour; petty vexations had to be endured, and much opposition at first to be encountered. But a spirit of genuine practical benevolence overcame all difficulties, active and passive; and the gentleman and his lady had ultimately the gratification of seeing their schemes successful. What may be the degree of pleasure they derive from reflecting on the good they have done, I leave any one to judge. Can their permanent satisfaction of mind be for a moment compared to the fleeting pleasures of an idle fashionable existence—a mere fiddle-faddling in drawing-rooms? And yet thousands never venture a thought beyond enjoyments of this transitory kind. I would not, certainly, recommend all the world to rush away to Ireland, like the hero and heroine of my anecdote, although many might do worse. Persons willing to do good to their fellow-creatures may find plenty scenes of enterprise, plenty things to do at their own doors. And to do so, is what is implied by a man's *finding his work, and doing it.*

Stuke.—Well, if it be all that, I think there is plenty of it just now. Every one seems to be running after everything but what he has any express call to interfere with. And what a struggle people have to appear what they are not! I am sure many mistake their own dignity and importance in trying to play second fiddle to others, for they only get laughed at for their folly. Cobden, the other day, I observe, gave a smart rap over the knuckles to those who build their greatness on this false foundation. 'I know a case (said he) exactly in point. In Cheshire there is a young man, the son of a wealthy manufacturer, who is exceedingly fond of hounds and horses, of hunting and sporting, and whose greatest ambition it is to ape the manners and keep the company of the neighbouring squires. He is the darling of his mother, who encourages him in all his extravagant expenses, on the plea that he is such a credit to the family, and keeps such good society—to

say nothing of the five or six hunters which he keeps besides. Well, this young gentleman was lately riding along the road with a certain friend of mine, a nobleman, and a hunting squire. On coming to a turn of the road, he thought that he would be able to make a steeplechase ride across the fields, instead of going round; and when he was gone, my friend inquired who was the young fellow with such capital cattle; when the squire replied, "Oh, he's only one of them cotton chaps off the hills." Now, if any of the cotton lords of Preston have the same ambition as the Cheshire cotton chap, let them think of what was said of him behind his back. The squires, although just before they may have been drinking your wine, will say of you, "He's only a cotton chap from Preston." They wont know anything more about you. It is always a great mistake for a man to attempt to set up for what he is not. For what he is, he is something; but as a mere sham, he is nothing. A cotton-spinner is somebody while he sticks by his order; he has in that both rank and respectability. It is through such as he that Manchester has become a great and important town in the estimation of statesmen and in the eyes of the world; and that greatness was acquired only by the Manchester manufacturers setting up for themselves and forming an order of their own. It is to them that we owe the institutions and Athenæum which have made Manchester celebrated.' Now, I take this not to be a bad hit.

Gil.—Of course it is; and I would add, that the man who follows his profession, is precisely the person who can be of most use in helping others. You talk of people running about doing things out of the ordinary track. Though not fond of betting, I will take any odds that if you investigate this very curious matter, you will find that it is chiefly the very busy who are concerned in all the out-of-the-way pieces of duty. I have always remarked this. Those who have plenty of time, and plenty of means, seldom do anything. Who are those who act as magistrates, as members of hard-working committees, as bustlers about on all occasions when any good work is on hand? Not the men who have nothing to do; not those who find a difficulty in killing time; but persons who have already nearly every moment filled up—who have perhaps twenty to thirty letters to answer daily, and who habitually give close consideration to private business of the most important kind. I have seen so much of this, that when I want any one to lend assistance in some useful public duty, I never go to the idle and leisurely—I always seek out the man who has so much to do that he scarcely knows which hand to turn to.

Stuke.—That seems about as paradoxical as the art of putting a quart into a pint bottle. I am for every person minding number one. Charity begins at home.

Gil.—Yes, but does not end there. No doubt men may sometimes do harm by their meddling. We must always take judgment along with us, and act accordingly. I am disposed, for instance, to think that there is far too much fuss made about improving the condition of the working-classes, so called.

Stuke.—I am all amazement! You who have always spoken in such a friendly strain of the working-classes!

Gil.—It is because I am their friend that I say what I say. Although an advocate for every one helping in the general cause of humanity, not only as a matter of duty, but from the pleasure to be derived from doing good, I am equally an advocate for all making the very best effort to help themselves. Self-exertion and self-dependence are unquestionably our portion. Nature, in my opinion, never intended that all the thinking should be done by a few, and that all the rest of mankind should act as puppets under them. Every man has brains as well as hands, and to impose no labour on these brains is far from wise. This is, however, what claptrap writers on the working-classes seem inclined to do. Instead of recommending working-men to use their thinking faculties, to cultivate self-denial and self-respect, to make every reasonable effort to improve their means and opportunities, they appear to wish them to remain passive—work, but not think; for everything that can improve their condition is to be left to the contrivance of the parties charged with looking after and thinking for them. Don't you see that this is not exactly as it ought to be, and is in some measure contrary to common sense? I think I pay the working-classes a much higher compliment when I tell them they have as good brains amongst them as are to be found in any other department of society, and that they have only to cultivate and exercise these brains, and act in unison with others who are desirous of aiding them, in order to remedy all imperfections in their habits and condition.

Stuke.—For my part I don't see that anything keeps down the working-classes but their intemperance. Cure that, and they will be all right.

Gil.—Intemperance is only a symptom of a disease, not the disease itself; and it is of little use attacking symptoms. Yet this is what has lately been attempted in the laudable endeavour to put down intemperance among the humbler classes. The true plan of procedure would be, to reach the malady which prompts men to consume their earnings in liquor. What is this malady? Ignorance; and, along with that, want of self-respect. Until the working-classes are educated, and improved in their tone of manners, their habits, and their aspirations, we can have little expectation of seeing them abandon dram and beer drinking. Temperance societies must therefore in a great measure alter their proceedings. They must commence a crusade against popular ignorance; insist on the carrying out of broad plans of national education; advance measures of sanitary improvement; and encourage all amusements, literary and otherwise, of a harmless kind.

Stuke.—I saw a pamphlet the other day in which the writer—the Rev. Thaddeus O'Malley, and apparently a well-meaning sort of man—pointed out how advantageous it would be for the working-classes to live in a species of clubs, forty to fifty families in so many apartments, all in one building: the saving of rent, and also by buying everything at wholesale prices, would, he says, be prodigious.

Gil.—I have no faith in these projects. They do not sufficiently take the failings and prepossessions of mankind into account. My belief is, that on human nature is stamped the principle of living in independent families. A husband, wife, and children, compose a community perfect in itself; and to seek happiness or prosperity by any other arrangement, is clearly against nature, and must necessarily fail. Some other time, I shall give you a little more of my mind on this momentous subject, if you will have patience to listen to me; meanwhile, as it is getting late, I must bid you good-by.

Stuke.—Good-by, Gilaroo, good-by. [*Gilaroo departs.*] A' queer fish that; I humour him in his newfangled notions.

THE POET'S VOCATION AND POWER.

It is not enough that the poet can gracefully dally with the flowers and the breezes by the wayside; that he can feel and make felt the glories of nature, and weave into his lays the beams of sun, and moon, and stars. These the genuine poet must and will recognise in all their beauty, and appropriate them as costly material in building the house of his fame. He will fashion them into a rainbow that shall span the weeping vale of earth, and make it radiant with the hues of heaven, even when darkest with storms. But this is not enough. Man is the grand work of nature, or rather of God; and it is in man, and his destinies and struggles, that the poet must find his noblest theme. The true vocation of the poet unquestionably is to animate the human race in its progress from barbarism towards virtue and greatness. He is appointed by Providence to arouse to generous exertion, and to console in distress. There is nothing so full of the elements of poetry as the fortunes, and aspirations, and achievements of the vast human family. Its endeavours to escape from the sensual into

the intellectual life; its errors, its failures, its sorrows, and its crimes, all are prolific of poetic and dramatic matter of the intensest interest. To guide and encourage humanity in its arduous but ever-onward career; to assist it to tread down despotism and oppression; to give effect to the tears and groans of the suffering; to trumpet abroad wrong in all its shapes; to whisper into the fainting soul the glorious hopes of a still higher existence—these are, and have ever been, the godlike tasks of the true poet, and therefore has he been styled a prophet and a priest. There never was an age in which the magnificent developments of human genius and intellectual energy, in which, too, the social position of society presented to the mind of the poet such stirring and magnificent themes, as the present. We have advanced, in Europe and America at least, out of the first periods of barbarism and semi-barbarism. Christianity has done a great work upon the earth in establishing as civil and as national principles the grand doctrines of human right, and in opening the general mind to the perception of the fact, that virtue, happiness, and immortality, go hand in hand. We have uttered our judgment against slavery, and war, and priestcraft, and have given deep and incurable wounds to those enemies of the earth's repose, if we have not been yet able utterly to remove them to their true place, amongst the monstrosities which are only matter of memory and of wonder. But we see daily in the mind not merely of private society, and of enlightened men in their writings, but in the mind of nations, and its expression through the press, that the leaven of peace and liberty is fast leavening the whole popular mass in most countries, and will ere long present glorious fruits. The energies which once manifested themselves in war, are now turned into the noble channels of moral investigation and scientific discovery. Steam, electricity, and chemistry, are from day to day luminously revolutionising all our modes of life and manner of thinking. By means of them 'many already run to and fro on the earth, and knowledge is increased.' But still there is a vast mountain of ignorance, of prejudices, and of crime and suffering to remove. The very light which is poured upon us only lays more bare to our astonishment the social evils that have long walked about in the darkness. We see the multitude thronged together in misery, and the few only 'faring sumptuously every day.' With growing knowledge we must have more equable comfort, and means of virtuous and intellectual enjoyment. From factories, and pits, and dense alleys, the weak and young cry out of oppressions that destroy body and soul, and they are the poets with the words of fire and feeling, at the head of preachers, literary and public men, who must be the great prophets of social sympathy, the heralds of justice, and Christian kindness between man and man, if they do not desert their heaven-appointed post. One true word from them goes like an electric flash through all the joints and sinews of society. It is on the great subject of human right and Christian love that they are only great to their possible extent. By this they seize at once on the whole world, and become famous in the same moment that they are the eternal benefactors of their fellow-men. It is not the particular evil which they strike at and destroy, which measures the limits of their benefaction. They propagate a spirit which goes on operating the same moral changes from age to age. By the single poem of 'The Shirt,' Hood acquired more fame than by all the previous labours of twenty years. He became in an instant the poet of the million, and instead of the smile which had illumined the face of jaded luxury at his puns, ten thousand blessings from the hearts of the wronged and afflicted rose up to Heaven on his behalf. What is it that has given to Burns and Ebenezer Elliot such a living place in the souls of the people? It is because, with all their love of nature, they had a still livelier love of man, and gave utterance to those great truths which became, as soon as uttered, the property, the language, and the watchwords of the million in their grand quest after liberty and knowledge.—*Eclectic Review for December.*

KINDNESS TO ANIMALS.

Cows will show their pleasure at seeing those who have been kind to them, by moving their ears gently, and putting out their wet noses. My old horse rests his head on the gate with great complacency when he sees me coming, expecting to receive an apple or a piece of bread. I should even be sorry to see my poultry and pigs get out of my way with any symptoms of fear.—*Jesse's Gleanings.*

GREAT BRITAIN.

The great alterations in mechanics, the application of chemistry to agriculture, and the unlimited powers of steam, seem to have opened to the people of Great Britain a new, and assuredly no unreal, field of view. Under forms from which the philosopher may turn away, as from empty symbols of material civilisation, the great ideas of an infinite extension of manly power and manly industry have been developed: with the exception of the superficial extent of this little island, every element of society is here in a state of rapid and endless growth. The population almost doubles itself in the course of a man's lifetime. The natural resources of the soil are continually increased by the application of science. What can always be achieved by power, can now be executed with certainty by means of the wonderful natural element which man renders subordinate to his service. In all directions, the walls of the world—the horizon of society—appear on the point of vanishing, and nobody can venture to fix a limit to the exertions or the acts of man in reference to his earthly existence on this planet.—*Augsburg Gazette.*

A HAPPY LIFE.

[SIR HENRY WOTTON, 1568—1639.]

How happy is he born and taught,
That serveth not another's will;
Whose armour is his honest thought,
And simple truth his utmost skill.

Whose passions not his masters are,
Whose soul is still prepared for death;
Untied unto the world by care
Of public fame, or private breath!

Who envies none that chance doth raise,
Nor vice hath ever understood;
How deepest wounds are given by praise,
Nor rules of state, but rules of good!

Who hath his life from rumours freed,
Whose conscience is his strong retreat;
Whose state can neither flatterers feed,
Nor ruin make oppressors great!

Who God doth late and early pray,
More of his grace than gifts to lend:
And entertains the harmless day
With a religious book or friend!

This man is freed from servile hands,
Of hope to rise or fear to fall:
Lord of himself, though not of lands,
And having nothing, yet hath all.

DOMESTIC ENDEARMENTS.

I hold it indeed to be a sure sign of a mind not poised as it ought to be, if it be insensible to the pleasures of home, to the little joys and endearments of a family, to the affection of relations, to the fidelity of domestics. Next to being well with his own conscience, the friendship and attachment of a man's family and dependents seems to me one of the most comfortable circumstances of his lot. His situation, with regard to either, forms that sort of bosom comfort or disquiet that sticks close to him at all times and seasons, and which, though he may now and then forget it, amidst the bustle of public or the hurry of active life, will resume its place in his thoughts, and its permanent effects on his happiness, at every pause of ambition or of business.—*Horne.*

RECREATIONS.

Let your recreations be manly, moderate, seasonable, and lawful: the use of recreation is to strengthen your labour and sweeten your rest. But there are some so rigid or so timorous, that they avoid all diversions, and dare not indulge lawful delights for fear of offending. These are hard tutors, if not tyrants to themselves; whilst they pretend to a mortified strictness, they are injurious to their own liberty, and the liberality of their Maker.—*Steele.*

VISIT TO A HAREM.

BY A LADY.

eriencing for two days the miseries attend- weather in the Black Sea, it was with feel- expressible satisfaction that we found our l floating along the smooth water at the he Danube. We had the tedium of a qua- ore us; but it did not extend to the Turkish river; and we accordingly went ashore at a ttle village, where the captain stopped for an e in provisions. We had, however, miscal- hospitality or rather toleration of these rural f Mahomet; for the moment we entered the ere followed by a growling crowd, full of fury t of a set of giaours, and in the end we had elves by flight from a shower of stones with y assailed us. Next morning, awaking at , we found our bark anchored in the har- idden, the principal town of Bulgaria, and government of the Pasha Eiredeen. A mes- the captain requested that I would come to act as interpreter.

ot long in obeying the summons, and found gers and officers of the steamer surrounding om I at once distinguished to be a Greek, wore the Turkish costume, and who was eavouring to make himself understood, with ls of wretched Italian, by a party who, except consisted solely of French and Hungarians. greatly relieved when I addressed him in nd he at once explained the purport of his Highness Eiredeen Pasha, whose doctor he ent him to request that we would go and visit had very seldom an opportunity of seeing nd particularly ladies. He had desired the se his utmost eloquence in securing our con- had sent several soldiers of his own guard to s in safety to the palace. Our captain, who stly to dread offending the pasha, declared uld not refuse, and that the visit would be resting; assuring me at the same time, that ce of the formidable-looking guard would re us from any annoyance. It was therefore hat we were to go; but when I prepared to doctor on shore, I found that our adventures eding evening had so far cooled the ardour f the travellers, that no one seemed disposed ny me except two Frenchmen, our own in- s and travelling companions.

large and really picturesque town, the streets handsome, lined with the open stalls where habitually transact business, and many of ed in, so as to render it agreeable to walk through them even in the heat of the day. As we passed along, preceded and surrounded by the soldiers, we were struck with the terror which they seemed to inspire among the people, who, so far from showing any disposition to injure us, scarcely even dared to raise their eyes. The doctor, who had been absent many years from Greece, was delighted to have an opportunity of talking his own language, and gave me much information as we proceeded: he told me that the pasha was exceedingly rich and powerful, and had many thousand subjects. The late Sultan Mahmoud had given him his own adopted daughter in marriage, and my new acquaintance promised to endeavour to obtain permission for me to visit the harem; but this, he said, was a favour rarely granted to any one, and would depend entirely on the pasha being favourably disposed towards us. He then asked me why the other passengers had not accepted the invitation; and when I mentioned the cause of their fears, he instantly begged I would describe the principal actors in the assault, and give the name of the village, 'for,' he said, 'the pasha will have them all punished instantly; he is anxious to encourage strangers to come here.' Now, I knew that in Turkey *punishment* invariably means decapitation, and I could not help thinking that such summary vengeance, taken on a whole population, would by no means tend to produce an encouraging effect on the minds of the travellers he wished to conciliate. My companions were of the same opinion. We therefore extorted a promise from the doctor that he would say nothing on the subject, and very soon found ourselves at the gate of the palace. It was a dwelling by no means unworthy of a prince, and covering a large space of ground. We passed through a handsome gateway guarded by sentinels, and entered an immense court almost entirely filled with soldiers. The building itself was low, and very irregular, consisting principally of a succession of long galleries and terraces; but there was also an endless number of rooms, each destined to a separate purpose, which the doctor named to us as we passed through them—the waiting-room, the audience-chamber, the room where the courts of justice were held, and so on; and in all of these, motley groups were to be seen, of just such persons as in more civilised parts of the world invariably crowd round the dwellings of the great. The pasha's own dependents seemed very numerous, and several of them now officiously led the way to the room where we were to wait his highness. The furniture consisted solely of a long low divan, amply supplied with cushions, and several baskets filled with the rarest flowers. The doctor, and several others who followed us in, took off their slippers on entering the apartment, and then ranged themselves round it, their hands crossed on their bosom. During the interval of delay which followed, we remained in great admiration of the view from the

windows, which was most striking; the strange oriental town, composed of the most fantastic buildings, and half hid by fine old trees, lay smiling in the sunshine, on the banks of the noble river. Suddenly a great movement was manifest in the outer room, and the doctor, with somewhat of trepidation, announced the pasha. Two or three soldiers entered, and took their station at the door, and his highness almost instantly appeared, leaning on two Turks. He was a tall, good-looking man, with piercing dark eyes, and a grave stern expression of countenance: he wore the tight-fitting braided surtout, and the red cap or fez, drawn down over his strongly-marked eyebrows, and his peaked black beard fell almost to his waist, where a magnificent sword was secured by a leathern belt. He possessed a dignity of manner which was really quite imposing; coming forward without speaking, he took my hand, and requested me to sit on the divan beside him, and then turning to the doctor, directed him to introduce my two companions, and ordered stools to be brought, that they might sit opposite to him. We were amused to see that the poor doctor, formerly gay and talkative, had suddenly subsided into the most humble and submissive of beings. He acted as interpreter—for his highness spoke nothing but Turkish—and some minutes were spent in going through the usual compliments with all due formality. Pipes were then brought in by two negro slaves; and one, splendidly inlaid with jewels, was offered to me. I was tolerably well acquainted with the ceremonious usages which are 'de rigueur' in an Eastern visit; and I therefore, to the utter astonishment of my French friends, composedly took it, and saluted the pasha with all the solemnity I could muster. It is only strict politeness to repeat this salutation, which is performed by placing the hand on the heart, the lips, and the forehead, every time that anything is offered; and the pasha and I were therefore to be seen constantly bowing with great gravity, while coffee and sweetmeats were being handed round. The intense solemnity of our proceedings, however, met with a most ludicrous interruption.

One of our passengers on board of the steamer was an American, and so thoroughly an American in manners and in ideas that we had very little intercourse with him, even within the narrow bounds of our common sitting-room. We even did not know his name, though one of our party had maliciously named him 'Kentucky,' from the constant repetition of this word in his conversation. The said Kentucky we had left asleep on the table in the saloon, and great therefore was our amazement when, unasked and unannounced, he made his appearance at the door, pushing his way through the guard, and marching up to the pasha, his hat on his head and his cane in his hand just as he would have walked along the streets of Boston. The intruder stared at his highness for a few minutes with imperturbable coolness, and then turning to me (for he could speak nothing but English), he ejaculated, 'I calculate he never saw an American afore.' The horror of my two companions (whose French politeness was most thoroughly shocked), the consternation of the doctor, and the indignation of the pasha at this want of respect, were most amusing; the latter fixed his flashing eyes on the unfortunate Kentucky with a look which evidently made him uneasy, and I hastened to excuse his sudden appearance the best way I could.

The doctor now told me that the pasha had consented to my visiting the harem, and he proposed conducting me thither at once, if I felt so disposed. I was delighted with the prospect of inspecting an establishment which must be so very characteristic, so perfectly Eastern; for the doctor told me that no other stranger had ever been admitted to the apartments of the sultana, who was of course a very great personage in their estimation, whereas, at Constantinople, so many travellers habitually visit the harems, that they are half Europeanised. My two companions did not, however, look much pleased at the idea of being left in solemn conference with the pasha, which, in the absence of the doctor and myself, must be reduced to the mute language of the eyes; nor did they seem to derive much consolation from my assurance that the further proceedings of Kentucky would probably afford them some excitement. But it was impossible that they should accompany us, and we therefore left them, seated beside the American, with whom they could hold no communication, and directly opposite to the pasha, who stared fixedly at them with the most imperturbable dignity. I followed my companion through several long corridors, putting to flight various negroes and other slaves, who seemed to think it was as much as their head was worth to look at me. The doctor told me, that on account of her high rank, the sultana reigned singly in the harem as the pasha's only wife, but that there were a number of odalisques, one of whom could speak Greek, and would interpret for me. We crossed an open court, with a fountain playing in the centre of it, and entered what seemed to be a separate building. Here the doctor stopped, not even passing the threshold, and told me he could go no farther, and that two negroes, who now presented themselves, were to be my guides. I did not half like being left alone in this strange-looking place, and would have remonstrated against his leaving me; but he looked perfectly terrified when I proposed it, and disappeared the moment the door was opened. The two slaves walked before me in silence, their eyes bent on the ground, through several passages, till we reached the foot of a stair, where they in their turn consigned me to the care of two women, who were waiting for me. One of these was the interpreter, a remarkably pretty woman, though immensely fat; and the other was, without exception, the most hideous old woman I ever beheld, whom I rightly guessed to be the duenna of the harem. They received me with the highest delight, and as though I were conferring a great honour upon them, fervently kissing my hands and the hem of my dress, in return for which I could only wish that they might live a thousand years and never see a 'bad hour.' Seizing me by the hands, they dragged me in triumph up the stairs, and through several rooms, to the audience chamber of her highness the sultana. Like that of the pasha, it was furnished with a long divan, over which were spread two of the most splendid cashmere shawls I ever saw: several cushions were ranged on the floor, and the windows were all hermetically closed by the fatal screens of which we had heard so much. They are a sort of wooden lattice; but the open spaces are so very small, that one can scarcely discern anything without.

The women made me sit down, and when I placed myself in the usual European manner, they begged me, in a deprecating tone, not to remain in that constrained position, but to put myself quite at my ease, as if I were in my own house. How far I was at *my ease*, installed 'á la Turque' on an immense pile of cushions, I leave to be imagined by any one who ever tried to remain five minutes in that posture. The interpreter now left me alone with the old woman, who crouched down on a cushion at my feet, and with the help of a few words of Turkish with which I was acquainted, she managed to give me quite as much information as I wished for on the domestic life of Eiredeen Pasha's large family. We were interrupted by the arrival of some fifteen or sixteen young slaves, who came running into the room laughing and talking like a party of school girls, each one pausing at the door to make me the usual salutation, and then clustering together in groups to gaze at me with the most eager interest. They all wore the same dress, and certainly it looked on them most singularly graceful, as they stood in a sort of languishing, indolent attitude, with their arms folded, and their long almond-shaped eyes half closed. It consisted of a loose silk jacket, reaching to the waist, another underneath, of a different colour, falling below the knee, and finally, a pair of enormously wide trousers, either wholly red, or a mixture of gay colours, which almost covered their little yellow slippers. A silk handkerchief, and various other ornaments, were twisted in their hair with quite as much genuine coquetry as is to be found in more civilised countries. Of all the number, only three struck me as having any

great claim to beauty; but certainly creatures more lovely than they were could nowhere have been seen. Two of them were Circassians, with long fair hair, and soft brown eyes; the other was, I think, a Georgian—very dark, with beautiful features and the most haughty expression of countenance. It was evident that she was held in great respect as the mother of a fine little boy whom she had in her arms. All of them had their nails dyed with that odious henna with which they disfigure their hands and feet.

Presently there was a strange shuffling noise heard without, a prodigious rustling of silk and satin, and the interpreter hurrying in, announced the sultana; the slaves fell back and ranged themselves in order, I rose up, and her highness entered, preceded by two negro boys, and followed by half a dozen women. She was a tall dignified-looking person, of some five-and-thirty, and far from handsome: nothing could be more splendid than her dress, or more perfectly ungraceful. She wore a pair of light-blue silk trousers, so excessively large and wide that it was with the greatest difficulty she could walk; over these a narrow robe of red cashmere, covered with gold embroidery, with a border of flowers also worked in gold at least six inches wide; this garment was about five yards long, and open at the two sides as far as the knee, so that it swept on the ground in all directions. Her waist was bound by a cashmere scarf of great value, and from her shoulders hung an ample pelisse of brown satin, lined with the most beautiful sibelline fur; her head-dress was a silk handkerchief embroidered with gold; and to complete her costume, she was literally covered with diamonds. She received me in the most amiable manner, though with great stateliness and dignity; and when I begged the interpreter to tell her highness how greatly I felt the honour she had done me in inviting me to visit her, her features relaxed into a smile; and dragging herself and her load of finery to the divan, she placed herself upon it, and desired me to sit beside her: I obeyed, and had them to recommence all the compliments and salutations I had gone through at the pasha's, with still greater energy, for I could see plainly that both herself and her slaves, who stood in a semicircle round us, were very tenacious of her dignity, and that they watched most critically every movement I made. I was determined, therefore, to omit nothing that should give them a high idea of my 'savoir vivre,' according to their own notions, and began by once more gravely accepting a pipe. At the pasha's I had managed merely to hold it in my hand, occasionally touching it with my lips, without really using it; but I soon saw that, with some twenty pairs of eyes fixed jealously upon me, I must smoke here—positively and actually smoke—or be considered a violator of all the laws of good breeding. The tobacco was so mild and fragrant that the penance was not so great as might have been expected; but I could scarcely help laughing at the ludicrous position I was placed in, seated in state on a large square cushion, smoking a long pipe, the other end of which was supported by a kneeling slave, and bowing solemnly to the sultana between almost every whiff.

Coffee, sweetmeats, and sherbet (the most delightful of all pleasant draughts), were brought to me in constant succession by the two little negroes, and a pretty young girl whose duty it was to present me the richly-embroidered napkin, the corner of which I was expected to make use of as it lay on her shoulder as she knelt before me. These refreshments were offered to me in beautiful crystal cups, little gold cups, and silver trays, of which, for my misfortune, they seemed to possess a large supply, as I was obliged to go through a never-ending course of refreshing them all. One arduous duty I felt it was also necessary I should perform, and this was, to bestow much admiration on the sultana's dress as I knew she would expect me to feel; I therefore exhausted all my eyes in praise of it, to which she listened with a pleased smile, and then, to my surprise, rose up and left me. I was afraid I had offended her; but a few minutes after, she returned in a new costume equally splendid and unbecoming, and I once more had to express my enthusiasm and delight, which seemed greatly to gratify her. She then returned the compliment by minutely inspecting my own dress, and the slaves, forgetting all ceremony in their curiosity, crowded eagerly round me. My bonnet sadly puzzled them; and when, to please them, I took it off, they were most dreadfully scandalised to see me with my hair uncovered, and could scarcely believe that I was not ashamed to sit all day without a veil or handkerchief; they could not conceive either why I should wear gloves, unless it were to hide the want of henna, with which they offered to supply me. They then proceeded to ask me the most extraordinary questions, many of which I really found it hard to answer. My whole existence was as incomprehensible to this poor princess, vegetating from day to day within her four walls, as that of a bird in the air must be to a mole burrowing in the earth: her life consisted, as she told me, of sleeping, eating, dressing, and bathing. She never walked farther than from one room to another, and I can answer for her not having an idea beyond the narrow limits of her prison. It is a strange and most unnatural state to which these poor women are brought, nor do I wonder that the Turks, whose own detestable egotism alone causes it, should declare that they have no souls.

Her highness now sent for her children to show them to me, which proved that I was rapidly advancing in her good graces: and, as I luckily knew well that I must not look at them without pronouncing the wish that they might live for ever, in case I should have an evil eye, she was well disposed to receive all my praises of them, and to allow me to caress them. She had four fine little children, and the eldest, a boy of six years old, was so perfect a miniature of his father, that it was quite ludicrous. He was dressed exactly in the same way, wearing even a little sword; and he came in bowing with so precisely the same dignified manner, that I really should as soon have thought of offering bonbons to the pasha himself as to this imposing little personage. My attention to the children quite won the heart of the sultana, and she desired the interpreter to tell me that we were henceforward to be 'sisters;' and I was obliged to receive this addition to my family connexions with becoming delight; she also wished me to be informed that she had once seen a Christian at Constantinople, and that she was not at all like me. I thought this very likely, but I was growing very anxious to terminate my visit, which had lasted, with its interminable ceremonies, nearly two hours. The sultana was very unwilling to let me go, but when I insisted, for I thought the patience of my companions must be quite exhausted, she once more rose and left the room; in a few minutes the interpreter returned, and, kneeling down, kissed my hand, and then passed a most beautiful diamond ring on my finger, which, she said, the sultana begged me to keep, though it was quite unworthy of her 'sister.' I was much shocked at the idea of taking it, for it was a ring of very great value; and though I ought to have known that in Turkey it is an insult to refuse a present, I could not help remonstrating. The sultana came in herself to bid me farewell, and I endeavoured to return it to her, but she frowned in a way which really frightened me, and commanded the slave to tell me that, doubtless, it was not good enough for me, and that, since I wished for something better, a more valuable present should be found. This settled the question, of course, and I put on the ring, and went to take leave: she had seated herself and received my parting compliments in great state; her last speech was to beg that I would tell the people of England always to recollect, that if they came to Widden it would suffice that they were my countrymen to insure their having a friend in Firedeen Pasha. I then touched her hand, and passed out of the room without turning my back to her, whilst the slaves kissed my hands again and again. To me one of the most painful feelings which assailed me during my visit, was in witnessing the fawning servility with which these poor creatures treated their mistress—it is an atrocious system altogether.

The same negroes waited to conduct me to the spot where I had left the doctor, and where I found him waiting for me, holding in his hand a string of amber beads, which he insisted on my accepting, and I no longer dared to refuse any present. Just as I thought, my two friends had been for some time very uneasy at my long absence, and heartily tired of staring silently at the unmoved pasha; the American had started up about five minutes after I left the room, and coolly walked off without even bowing to the pasha, who sent after him a look which led my friends for a moment to expect to see the head alone roll back through the door where the entire man had disappeared.

We immediately took our leave, as it was nearly time for the steamer to sail, and on arriving on board I had only time to send back a few brooches and jewels by our friend the doctor, in order that the remembrance of her adopted English sister may live a little longer in the recollection of the sultana of Widden. For my part, I shall not soon forget the singular insight I thus gained into the private life of so many responsible and reasonable beings, who live from year to year as degraded prisoners, and neither ask nor wish for freedom, honour, or justice.

RESISTANCE TO GREAT TRUTHS.

FRANKLIN AND ELECTRICITY.

The human mind, as has been often observed, is as difficult to move as matter; and with equal difficulty can it be checked when once in motion in any particular direction. A more correct mode of stating the proposition would perhaps consist in saying that it is not the mind, taken in its ordinary sense, which presents this inertia, but something which deceitfully assumes the semblance of mind: is it not, in short, prejudice cherished in defiance of examination and conviction? or may it not be in some cases only an exhibition of opinion, at variance with the convictions of the intellect? Arising from whatever source, this inertia, or hostility to change, is in no case so strikingly manifest as in the birth and development of important truths, or scientific discoveries, affecting in many instances the well-being of society: in the diffusion of knowledge, whose blessings would have elevated and energised the world at large.

At first sight, it appears unaccountable that truth should make its way with less facility than error; that the minds of men should open so tardily and reluctantly to the light. The explanation may however be, that slowness of progress is essential to the permanence of truth; or that the *inertia* really consists in lack of knowledge. Ignorance and prejudice are always great enemies of truth. Copernicus kept his celebrated work—in which he established the Pythagorean hypothesis, that makes the sun the centre of our system—locked up for thirty years before he ventured to publish it. One hundred years later, Galileo, who had taught the same doctrine, was made to abjure his opinions publicly, and on his knees; and to declare that he would abstain from their promulgation in future. Two generations passed from the earth after Newton first made known his sublime theory and discoveries, ere they were generally appreciated and adopted. But this is not all: neglect and disfavour were not the only impediments; envy and jealousy, selfishness and hatred, have from time to time arrayed themselves in formidable opposition. Men have blindly combined to stay the course of truth, little thinking that they might as well attempt to arrest the motion of our planet as it turns to meet the beams of day.

The history of an individual case would perhaps *better* illustrate these views than a regular process of reasoning. In selecting Franklin, we take a name familiar to all readers: his fame has travelled into every nation. One passage in his life furnishes a text admirably adapted to our present purpose. We read that, on the occasion of making his celebrated kite experiment, so conscious was he of the ridicule that awaits untried or unsuccessful experiments in philosophy, that he went out to the fields, accompanied by his son, to whom *alone* he had communicated his intentions. This is a striking case in point: here was a man holding in his hands the clue to a new truth, about to become its interpreter to the world, yet dreading the world's cognisance of his novel and daring investigation.

Without entering upon details as to the history and progress of electricity prior to Franklin's researches, it may be observed that the subject was but little understood till the time of Hawkesbee, who added materially to our knowledge by his numerous experiments on attraction and repulsion, in which he made use of a globe of glass, set in motion by machinery, instead of rubbing glass tubes, as was the usual practice. Nothing was added to his inquiries until after the lapse of twenty years, when we meet with the names of Grey, and Du Faye of Paris, intendant of the royal gardens, who was the first to note the passage of the electric spark from the human body: he also discovered the two different properties of electricity, which he distinguished as the *vitreous* and the *resinous;* and gathered additional facts respecting attraction and repulsion. A body vitreously electrified repelled bodies in a similar state, but attracted those in a resinous state; and the reverse. This was the germ of that theory which Franklin subsequently extended and established on a true basis. Next came Wheeler and Desaguiliers, and the German electricians, one of whom introduced the use of the revolving cylinder. In 1746, Muschenbroeck, a professor at Leyden, discovered the surprising properties of the so-named 'Leyden phial;' and soon after, several French and English experimentalists discovered that the electric shock could be conveyed to great distances by means of wires and strings. At the same time, Mr Watson made the important observation, that the glass tubes and globes used in the experiments 'did not contain the electric power in themselves, but only served as first movers and determiners of that power.'

Du Faye supposed that the operations of the two electricities he had discovered were always distinct, never combined; but Franklin showed that the difference between the two consisted simply in the excess or defect of one and the same fluid; which his experiments subsequently confirmed. He had heard of what he calls 'Mr Muschenbroeck's wonderful bottle;' and in 1747 proceeded with his accustomed industry to investigate the phenomena on which its efficacy depends. He found that the *vitreous* and *resinous* electricity of Du Faye were nothing more than *positive* and *negative* states of the same fluid; 'and showed that the inside of the bottle is electrified positively, the outside negatively; and that the shock is produced by the restoration of the equilibrium, when the outside and inside are brought into communication suddenly.' When a globe of glass was used, the charge in the prime conductor was increased, or *positive;* but if a globe of sulphur was employed, then the charge was decreased, or *negative.*

Together with Watson, Franklin, to use his own words, had discovered that 'the electrical fire is not created by friction, but collected—being really an element diffused among, and attracted by, other matter, particularly by water and metals. . . . To electrise *plus* or *minus*, no more needs to be known than this, that the parts of the tube or sphere that are rubbed, do, in the instant of the friction, attract the electrical fire, and therefore take it from the thing rubbing: the same parts immediately, as the friction upon them ceases, are disposed to give the fire they have received to any body that has less;' and in charging the Leyden phial or jar, 'whatever quantity of fire is thrown down upon one side of the glass, the same is thrown out of the

other. There is really no more electric fire in the phial after it is charged than before; all that can be done by charging being to take from one side, and convey to the other.'

But his most famous discovery was the identity of electricity with thunder and lightning. His thoughts had long been directed to the subject; and he was waiting the completion of a tall steeple, then being built at Philadelphia, in order to attempt his experiments, when, growing impatient of the delay, he determined on trying to bring down the electric fire by readier means. For this purpose he took two light cross sticks of cedar, to the extremities of which he fastened the four corners of a silk handkerchief, as being the best material to resist the effects of a thunder-shower. To the upper end of one of the sticks a pointed iron wire, about a foot in length, was attached; and with tail, loop, and string, the kite was completed. In the summer of 1752, as stated above, he went out to the fields, accompanied by his son, and raised the kite. To the end of the hempen string was tied a key, to which was fastened a silken string, kept dry by being placed under a shed. One very promising cloud passed over without effect; and as the fate of his theory depended on this experiment, he was beginning to despair of success, when he observed the loose fibres of the hempen string to separate, and, as it were, repel each other. He put his knuckle to the key, and received a spark; and when the twine became thoroughly wet, charged a jar with electricity drawn from the clouds. His sensations on drawing the spark—on verifying his hypothesis by actual experiment—will be shared by every earnest inquirer for the truth, who, divesting himself of narrow and selfish views, regards only the best and universal interests of society. The essentially practical genius of Franklin soon led him to apply his discovery to the benefit of mankind, by the use of pointed iron conductors affixed to buildings, which have been more generally adopted in America than in Europe. He afterwards erected a pointed iron conductor on his own house, to which a bell being attached, warned him by its ringing whenever the rod was charged with electricity: with this he made many experiments to ascertain the electrical state of the clouds.

We shall now see how Franklin's discoveries were received—not by the ignorant or by the world generally, but by the learned, the great men of science. Franklin announced his theories with the modesty of genius. Having been led to examine into the phenomena of electricity, by the present of a glass-tube from Mr Peter Collinson of London, in return he sent him information of his success, and wrote him several letters containing accounts of his experiments. 'Collinson got them read (says Franklin) in the Royal Society, where they were not at first thought worth so much notice as to be printed in their Transactions. One paper, which I wrote for Mr Kinnersley, on the sameness of lightning with electricity, I sent to Mr Mitchel, an acquaintance of mine, and one of the members also of that society, who wrote me word that it had been read, but was laughed at by the connoisseurs.' The papers were eventually given to Cave, for publication in the *Gentleman's Magazine*, who preferred to publish them separately; in which he 'judged rightly for his profession; for, by the additions that arrived afterwards, they swelled to a quarto volume, which has had five editions, and cost him nothing for copy-money.'

Priestley, in his History of Electricity, published in 1767, says of this publication—which bore the unassuming title of New Experiments and Observations on Electricity, made at Philadelphia, in America—'Nothing was ever written upon the subject of electricity which was more generally read and admired in all parts of Europe than these letters. There is hardly any [illegible] language into which they have not been [illegible]; and, as if this were not sufficient to make [illegible] properly known, a translation of them has lately [illegible] made into Latin. It is not easy to say whether we are more pleased with the simplicity and perspicuity with which these letters are written, the modesty with which the author proposes every hypothesis of his own, or the noble frankness with which he relates his mistakes when they were corrected by subsequent experiments.

Priestley was almost the only man with the reputation of a philosopher in England who spoke with fairness of Franklin's discoveries; in fact the only person, as far as can be judged, who really examined them without prejudice. European men of science generally were unwilling to believe that an American and a colonist, separated by the ocean from the world of letters, should have discovered that by which they had been so long puzzled. In England there was another cause for dissatisfaction, if not contempt. Franklin was known to be a printer—a mechanic, who had actually wrought at the press. In some works of the day he is spoken of as 'that fellow Franklin, a Philadelphia printer.' That a printer should presume to teach the learned and the aristocratic dilettanti of London, was too bad; and his letters, as we have seen, were treated with the indifference they were supposed to merit. Yet there were his theories, and what should be done to put them down? The Abbé Nollet of Paris was among the first to take up the cudgels against the Franklinian hypothesis. His own theory was of 'affluence and effluence;' somewhat similar to that entertained by Boyle, of which, he says, he 'was obliged to undertake the defence, seeing that he could do so with good reasons, and in spite of the pretensions of the Philadelphian school; that he was in some measure attached to his own principles; and before trying the other, he was resolved to try if he could not make Franklin's experiments square with his own theory.' The abbé displayed in this not only a pitiable weakness, but went further; for, to use the words of one of Franklin's friends, in repeating the experiments, he 'alters them without giving any reason for it, and makes them in a manner that proves nothing: and further, he taxes Mr Franklin with having concealed a material part of the experiment; a thing too mean for any gentleman to be charged with, who has not shown as great a partiality in relating experiments as the abbé has done.'

The opposition of the Frenchman only served to expose his own prejudice and dishonesty. The attention of the unprejudiced in all parts of Europe was drawn to the new theory, and many of them—among whom Beccaria of Turin particularly distinguished himself—stepped forward to its defence.

An opponent was found in our own country in a Mr Peart of Gainsborough, whose arguments will serve as a general specimen of the opposition offered by the envious of that day to the Franklinian doctrine. In 1791 he wrote a work in which he explained his own theory, and denounced that of Franklin. He contended for two active principles, which he named *ether* and *phlogiston*, one of them found at one end of a magnetic needle, the other at the opposite end. 'These principles,' he says, 'and this theory, alone can rationally explain the phenomena of electricity, which never will be understood unless they be admitted. . . To attempt to account for them by the doctrine of positive and negative electricity, would be as ridiculous as ineffectual. . . Must we admit of a theory which plainly gives the lie to all our senses, in every electrical experiment, when plain sense, with a little attention, will point out the falsity of the doctrine? . . The whole doctrine of plus and minus electricity is a groundless error, contradicted by reason, and by every electrical appearance, and therefore not worth defending. . . But enough of a theory so puerile and unnatural.'

In a subsequent publication, he replies in no very measured terms to a gentleman who had ventured to undertake Franklin's defence: — 'And pray who are you, sir, who thus arrogate to yourself the privilege of condemning every opinion which differs from your own?' And accuses him of adopting 'a style which is too com-

monly assumed when ignorance is inflated by self-importance; when arguments are wanting; or when there happens a combination of the two.'

Here we might descant upon the absurdity of pinning one's faith to any particular theory. The inquirer after *truth* needs no theory: his mind should be ever opened to its influences, come in what shape soever they may. Had but a tithe of that energy which has been wasted in factious opposition, been devoted to patient and unprejudiced investigation, the position of society would be far above what it is at present. The folly is rendered more evident by the result. Franklin's views were admitted in proportion as they became known. There was found to be truth, after all, in the statements of the Philadelphia printer. The Royal Society even owned itself to have been wrong; it atoned for the 'laugh of the connoisseurs' by electing Franklin a member of the body, and conferring upon him a gold medal. His principles, now universally recognised, bid fair to be handed down to posterity as equally expressive of the principles of electricity, as the Newtonian philosophy is of the true system of nature in general. His example is a striking instance of what may be done by honest, patient, and truth-seeking perseverance.

THE FREAKS OF FORTUNE.

FROM THE FRENCH.

'Nothing can be done without money,' said George pettishly; 'I had a splendid project in my head, but nobody will listen to such a poor fellow as I.'

We were three friends met together, bewailing the rigours of fortune: our lamentations, however, took the turn they usually take among companions whose age does not exceed twenty years.

'And I,' said Albert, 'have finished a work which would create my reputation, could a publisher only be met with willing to undertake the expenses of printing.'

'I have asked our principal,' added I, 'to increase my salary, after four years of assiduous service; and he answered, that of such clerks he could find as many as he wished for six hundred francs a-year.'

'My dear fellows,' interrupted George, 'although we have, neither the one nor the other, any hope of making a fortune, could we not get the credit of being rich?'

'To what good?' asked I.

'It gives one a position in the world; a large inheritance augments the consideration in which we are held; everything becomes easy.'

'I remember,' was my answer, 'having heard in my childhood of a cousin who went to Jamaica or Martinique, and never returned.'

'That is just what we want: we will bring this cousin to life, or rather we will kill him. Yes; Jaques Meran died at Martinique, leaving a sugar plantation, fifty slaves, in short, a fortune valued at two millions of francs, all to his dear cousin Louis Meran, from attachment to the name.'

We laughed heartily at the joke, of which I thought no more: but my two reckless friends, George and Albert, spread abroad the tale when we broke up with all the seriousness imaginable.

The next day people came to compliment me. It will of course be understood that I disavowed all cause; but no one would believe me; my two friends had affirmed the truth of the report. In vain did I assert that it was all a joke: many remembered my cousin Jaques; some had actually seen him embark at Nantes in 1789. Among the number of these visits was one of not the most agreeable. With the whim of a young man, I had some time previously ordered a frock coat in the new fashion, without having the means of payment; the garment was worn out, and I yet owed half of it. There had been for some time a coolness between my creditor and myself, whose importunities I wished to avoid. The rumour of the legacy made him hasten to find me: such was the penalty I paid for the foolish pleasantry of my friends. 'Good day, Monsieur Matthieu,' said I with some embarrassment as he entered; 'you are come for the fifty francs?'

'Does monsieur imagine that I am thinking of such a trifle? No; it was for the mourning.'

'What mourning?'

'The mourning for your cousin, monsieur—the mourning of an heir-at-law! Without doubt you want a complete suit?'

'At this time, Monsieur Matthieu, it would be impossible.'

'I hope monsieur does not think of withdrawing his favours from me? Coat, vest, and pantaloons black; frock of dark bronze for the morning.'

'I tell you again I have not yet received——'

'I intreat monsieur not to speak of money; it will come soon enough,' added the tailor, who had already taken out his scissors, and passed his measure round my waist.

I was in truth in great want of clothes, and permitted him to continue. No sooner was he gone than another individual entered, who immediately began, 'My dear monsieur, you must do me a great service. Buy my house. You are rich, very rich—you want real estate. Fifty thousand francs are nothing for you: only the half of your income: and at present I am in urgent want of money. I expected Monsieur Felix to buy it; but he does not decide, and I have some pressing engagements to settle.'

'I buy your house?—what folly!'

'It is no folly. It is a safe investment. After some repairs, in two years it will be worth double. I have your word;' and he left without giving me time to reply. So well did he propagate a report of my purchase, that in two hours afterwards Monsieur Felix came to me in a great hurry, apparently out of humour. 'You have cut the grass from under my feet, monsieur,' said he on entering: 'I cannot do without that house, and thought it was already mine, as I had made an offer of forty-nine thousand francs, believing that the owner would surely come to my terms. But there is no hope of starving you into an agreement; so, without further preamble, I come to offer you an advance of fifteen thousand francs upon your bargain.'

Fifteen thousand francs coming, I knew not how, to me, who had so much trouble in earning my eight hundred francs of salary as clerk to the registry of the courts of law. Although but little acquainted with business, I saw the advantage to be derived from my position, and replied, 'It is impossible, monsieur, for me to give you an answer at this moment: return at five o'clock: meantime I will consider the matter.'

At a quarter before the appointed hour Monsieur Felix was again at my door. 'Monsieur,' said I, 'I had no wish for that house, and did not even think about it, when the proprietor came to beg me to purchase it; and it appears the house is now mine. As it suits you, and any other will do as well for me, I accept your offer.'

'You shall be paid in a fortnight, in paper on Paris,' exclaimed the purchaser, delighted with my promptitude in business.

Paper on Paris! I was so little accustomed to that currency, as to imagine that it would be necessary to send it to the capital for payment, and therefore wrote to a commercial house, the only one whose address I knew, as from that I received regularly an annuity of five hundred francs left me by one of my uncles, and which formed a welcome portion of my income.

With what impatience I waited the expiration of the

time, when I wrote to Messieurs Hugues and Bergeret that, having certain funds to invest, I begged their advice as to the safest mode. It appeared that the words *certain funds* have very different acceptations in commerce, according to the name and position of him who uses them. The news of my inheritance must have reached Paris. *Certain funds*, situated as I was, was a modest manner of specifying a considerable sum; at least I supposed so, on receiving in answer from the firm that my letter had been received just before the close of the Cortes loan, in which they had purchased to the amount of twenty thousand dollars; that, if I thought it too much, a large profit might be immediately realised, as the stock had gone up. A postscript, in the hand of the principal, congratulated me on my accession of fortune.

Twenty thousand dollars! The letter fell from my hands; the amount frightened me. I wrote instantly to my correspondents, informing them that so large a sum went beyond my means; adding, that no remittances having been received from Martinique, as they supposed, I was unable to satisfy their claims.

The answer came in a day or two, stating that, as I did not appear to have confidence in the Cortes loan, they had sold out my stock at a profit of eighty thousand francs; and begged me not to feel uneasy, as remittances were always slow in coming from the distant plantations; in the interim, my signature would furnish me with all the money I could want. The prospectus of a German bank was inclosed, in which fifty shares had been secured for me.

Eighty thousand francs! Either I understood nothing of commercial matters, or the clerk had written one or two noughts too many. My situation became embarrassing. I was overwhelmed with congratulations, especially when I put on my new suit of black. The editor of the newspaper thought himself obliged to give a biography of my cousin Jaques, and asked me for additional particulars. I was besieged with annoying questions. In what way would I furnish my house?—what would I do for public establishments? Some benevolent ladies wrote to recommend to my notice the institutions under their guardianship. I was ruined in postages; for, in the midst of all my riches, whether real or imaginary, I had no money. Fortunately, from the moment I was held to be rich, no one would take a sou from me, and tradesmen courted the honour of giving me credit.

At last I decided on going to Paris. Immediately on arrival, I went to my bankers, who received me as the inheritor of great wealth. 'I regret,' said M. Bergeret, 'that you mistrusted the Spanish loan, for the stock has again gone up. No matter, however; you have some left.'

'Will you have the goodness, monsieur,' said I, 'to tell me precisely how much all these funds are worth which you have bought for me?'

'The calculation is easy. Twenty thousand dollars, at so much the dollar—and the sum already paid. If you sell to-day, you will put about two hundred and twenty thousand francs into your pocket.'

I opened both my ears. 'You say, monsieur, two hundred and twenty thousand? Are you quite certain?'

'As certain as any one can be within a few hundred francs.'

I did not wish to appear too much the novice, and replied, 'That is well: you spoke also of a bank?'

'Yes; the establishment of this bank has met with some difficulties; but the affair is not less good: we are on the eve of terminating it, and the scrip is well up.

'Could that scrip also be sold?' I inquired.

'You hold fifty shares,' replied the banker, 'which you advanced four hundred and fifty florins, making together nearly sixty thousand francs.'

'Although as yet I have paid nothing?'

'Without a doubt,' was the answer.

'That is singular: but since you say so, I submit. I should like to make a safe investment of the whole: will you be so kind as to specify one?'

'Our five per cents., monsieur—our five per cents.: I know of nothing safer. At the present rate, the gain will be six. I can easily understand that all these little matters worry you. You will soon have to deal with much larger sums.'

'By placing all that I hold in the five per cents., I should have an income of——'

'That is soon reckoned. Three hundred thousand or thereabouts: the quotation at eighty makes eighteen thousand francs. Say twenty thousand, to make a round sum.'

'Ah, twenty thousand francs of income,' said I; 'when could I receive it?'

'Oh, to-morrow, if you confide the transaction to our house.'

'That of course,' was my rejoinder. 'What other could inspire me with so great a degree of confidence?'

The banker bowed.

Will it be believed? in the midst of all these treasures, I felt a certain embarrassment in asking for a small sum, of which I stood in the greatest need; for, after paying the expenses of my journey, I had but five francs left. Such, however, was the force of habit, that I could scarcely believe myself legitimately possessed of more than my little annuity, which was not yet due.

'Dare I ask,' I inquired, with a blush almost of shame on my cheeks—'can I, without indiscretion, beg you to advance me for the moment a small sum, which I want on arrival in a strange city?'

'Eh, my dear monsieur, my chest is entirely at your disposal. How much do you want—three, four—ten thousand francs?'

'I do not ask so much; a thousand will be sufficient.'

'Will you have it in gold or notes? Call the cashier. May I beg you,' said the banker, leading the way as I rose to depart—'may I beg you to continue your goodwill to our house?'

'Certainly, monsieur; you well deserve it,' I replied with a confidence which the certainty of possessing an income of twenty thousand francs began to give me.

'There is yet one favour which I wish to ask,' said M. Bergeret; 'you are not acquainted with Paris; you have perhaps but very few relatives here: come and take a family dinner with us to-day; my wife will be delighted to make your acquaintance.'

'With the greatest pleasure.'

'We dine at six: if you have no engagement for the evening, we shall have a few friends, and hope you will stay.'

There are few moments which I remember with more satisfaction than those of my leaving M. Bergeret's house. I began to believe in the reality of my fortune, and had a thousand francs in my pocket—a pleasure which had never before happened to me. The fifty golden Napoleons gave me an extraordinary impulse; in fact I stood in great need of them. Possessor of twenty thousand francs of income, I was obliged, on my arrival in Paris, to leave my trunk at the office of the diligence, not having the means of paying for a lodging. I now hastened to redeem it, and afterwards took a coach to the first hotel pointed out to me, where I established myself in a handsome apartment, and put on my suit of mourning. I arrived with so much punctuality at M. Bergeret's, that he had scarcely had time to finish telling my history to his wife. She, however, had heard enough to cause me to be received as a friend of the house. Every one did the amiable to me: I met beautiful women; and overheard whispered remarks made upon me—*modest bearing; great skill; splendid business talents.* Thus, when M. Bergeret intreated me to regard his house as my own, I promised willingly, although I could profit but little by the invitation. Madame Hugues would have me to dine, when I met with other introductions and invitations. I was taken to the theatre and to parties. Now that I was

rich, I could almost have confined my expenses to some few presents and fees.

Meantime my two friends, George and Albert, had heard with alarm of the success of their report, the truth of which they dared no longer deny. They had been frightened by my departure for Paris, which all the world attributed to difficulties in the liquidation of my debts; and feared that I had suffered myself to be deceived by what was concerted between us merely as a joke.

Three days after my return from Paris, my servant announced their names. 'Let them come in,' was my reply; for I did not receive all the world. On seeing my handsome timepiece and gilt candelabra, and the new furniture with which I had decorated my apartment, they opened their eyes in consternation.

'There is much difficulty in gaining admission here,' said Albert.

'Yes; I am besieged by persons with all sorts of solicitations and projects; but you, my dear friends—you will be always welcome. You are come just in time to accompany me to an estate which I have some thoughts of purchasing. It is not a large affair—one hundred thousand francs.'

'I take it to be some distance off,' said George, with a significant jerk of his head.

'Two leagues only; but I will take you in my carriage.'

'Your carriage!'

'My carriage.'

'You have a carriage?'

'Yes, and two dapple-gray horses, which I brought from Paris: as yet I have no saddle-horse, that being more difficult to find.'

My two friends retired to one of the windows, where they whispered to one another, looking all the time very lugubrious.

'Dear Louis,' they said, 'you know that your cousin is *not* dead?'

'I don't know if he be dead, for I am not very certain that he ever lived.'

'You know that this story about your inheritance is all a joke?'

'I am persuaded that only you and I believe so,' was my answer.

'We have done great wrong,' rejoined my friends,—'great wrong, in what was intended only as fun. It causes us much sorrow.'

'On the contrary, I thank you for it.'

'It is our duty to disavow it; we are going in public to declare ourselves guilty.'

'I intreat you to leave things just as they are: a few days more of credit will prevent the necessity of displacing my funds.'

George and Albert regarded me as completely deranged. 'Come,' said I, 'let us lose no time; the carriage is ready; I will tell you all as we go along. I have spoken to a bookseller, Albert, who will print your manuscript.'

Truth, however, always comes out. Some who were on the watch, were surprised that nothing arrived from Martinique; well-advised people shook their heads when speaking of me. The edifice so quickly raised tumbled down with equal rapidity.

'The best of it is,' said some, 'he has ended by falling into the snare which he laid for others. For my part, I never believed in it.'

I comprehended that the storm had broken out, on finding one day a dozen notes on my table. They were all nearly in the style of the first I opened.

'M. Grignon presents his respectful compliments to M. Meran, and having an urgent need of money, begs that he will be so good as to pay, in the course of the day, the little account which he has the honour to enclose.'

My answers were all alike—'M. Meran thanks M. Grignon for the bill which has been so long asked for, and sends the amount.'

One letter only contained no request for money; it was from a friend whom I had almost forgotten. Fearing that I had been duped, he wrote, offering to lend me 500 francs, should I wish to remove from a place where so many rumours were circulated prejudicial to my character. My reply gave the necessary explanation, which I concluded, 'I am rich, not by an inheritance in which I never believed, but because it was determined, in spite of my protestations, that I should be rich; and I have in reality been made very rich, I scarcely know how. This is what I would wish you to say to those who talk of me.'

I owe more than fortune to my singular situation, since it has assured me of a friend upon whom I may count in adversity, should it ever visit me. For another week I was the subject of conversation. 'He has been fortunate,' said some; others replied, 'Fortunate if you will; but I say he is a clever fellow, who has known how to take advantage of circumstances; it is not everybody who could manœuvre in this way.'

For my part, I was for a moment tempted to applaud my own genius; but a little reflection convinced me that talent had nothing to do with it. I quietly took my place in society as the possessor of twenty thousand francs of income, and still keep it.

Moralising on my sudden change of position, I can only look upon it as one of those strange freaks of fortune which all the world allows to be so unaccountable.

INSECT IMPORTANCE.

INSIGNIFICANT as insects may appear to the casual observer, there are families of the race which assume the highest importance, either from the benefits they confer or from the ravages they commit. We grant that it is neither a very dignified nor always a very accurate mode of estimating the importance of the lower animals to judge of them merely as they may subserve or thwart the purposes of man; but taking even this standard, we shall find that insects are not the insignificant creatures we vulgarly esteem them. Individually, the highest of the class is but a feeble instrument either for good or for evil: it is the infinity of their numbers, and the fact of their generally living and acting in community, that renders them special objects of human consideration. We shall glance, in the present paper, at a few whose produce gives to them an economical and commercial importance.

By far the most valuable of the class is the silkworm (*Bombyx mori*), whose splendid tissue has been known from the remotest antiquity. Though early cultivated in China and India, it was not till the beginning of the sixth century that the insect was brought into Europe. Since then the culture and manufacture of silk has extended over Italy, France, and other southern countries, holding a high place in their economy, giving employment to a vast number of hands, setting in circulation a large amount of capital, and involving much intricate and difficult fiscal regulation.

It is not our intention to enter upon the natural history of the silkworm—which, like many other insects, passes through the successive stages of egg, caterpillar, chrysalis, and moth—farther than to remark that it is in its second stage that it becomes economically important. Each moth having dropped to the number of 300 or 500 eggs, these are hatched by natural or artificial heat, according to the climate of the country, and a voracious caterpillar is the produce, which is carefully tended and fed with mulberry leaves, or with lettuce—both of these plants abounding in a tenacious juice or caoutchouc. On acquiring its full growth (about three inches in length), this caterpillar spins for itself an

oval-shaped cocoon, formed by a single filament of yellow silk, from ten to twelve yards in length, emitted from the stomach of the insect preparatory to its assuming the chrysalis form. It is in this state that the silk is taken, the insect being destroyed by immersion in warm water, and the cocoon carefully unwound. Were the cocoon left undisturbed till the chrysalis had become a moth, the latter would eat its way through the envelope, and so cut the silk into a number of short lengths, instead of one continuous filament. Of course a sufficient number of cocoons are left untouched for next year's brood, comparatively few moths being sufficient to stock an extensive establishment. It is thus that a plain-looking, greedy, leaf-devouring insect becomes of so much economical importance; requiring human attention to supply it with food and shelter, hands to unwind the silken cerement, to assort and twist the filaments into threads, cords, &c.; individuals to dye, weave, and finish it—independent of the co-relative aids of chemists, designers of patterns, and framers of the necessary machinery. Nor can this insect, humble as it may seem, be dispensed with so long as man admires and values the beauty of a silken fabric; for though he knows that the cocoon is obtained by the animal from the peculiar vegetables it feeds upon, yet all his boasted knowledge in chemistry has not enabled him to elaborate from mulberry leaves a filament possessing the same lustre, beauty, and tenacity.

It is almost impossible to enumerate the various fabrics woven from silk, either for the purposes of dress, upholstery, or ornament; but an idea of its importance may be formed from the fact, that scarcely an individual, even in humble life, but can boast of wearing it to some extent, either for dress or ornament. In Britain the annual value of the manufacture is estimated at nearly ten millions sterling—more than nine-tenths of which are for home consumption. We draw our chief supplies of the raw material from Bengal; from Italy, which produces about eleven millions pounds annually; from China, where, next to tea, it is the staple article of export; from Turkey; and in smaller quantities from Holland, the United States, and other countries. The foreign states in which the manufacture chiefly exists are China, India, Italy, Switzerland, and France; the latter kingdom alone producing fabrics to the annual value of about eight millions sterling. We have no very accurate data as to the amount of silk stuffs consumed in the various countries of the world; but considering how generally they are worn in oriental as well as in European countries, and reflecting upon the increasing demand by a civilised population in the Americas, we cannot be far wrong in stating that a million and a half of human beings derive their sole support from the culture and manufacture of silk, and that it creates an annual circulating medium of between thirty and forty millions sterling! So much for the importance of an humble insect which, if it had been shown to our ancestors five hundred years ago, would have been as little valued as the earth-worm beneath their sandals.

As an appropriate sequel to the silkworm, we may next advert to the cochineal insect (*Coccus cacti*), from which the red dye-stuff of that name is obtained. The male insect is winged, and not much larger than a flea: the female is wingless, and when full grown, about the size of a barley grain. It is the dried body of the female which forms the cochineal of commerce, having in this state the appearance of a shrivelled berry. It is principally used in dyeing scarlet, crimson, and other esteemed hues of which red forms the basis. The insect is found in Mexico, some of the southern states of the Union, and in the West Indies, and has we believe been introduced with some success into our East India possessions. The principal supply, however, is still from Mexico and the Central States, where it forms a staple commodity of export. In a wild state, the cochineal insect feeds on various plants of the cactus tribe; but under cultivation it is confined to two or three species, which are found both to increase its size and colour. The wild variety is gathered six times a-year; but that which is cultivated is only collected thrice during the same period. Arrived at maturity, the insects become torpid, and are detached by a thin split of bamboo, or by a blunt knife—care being taken not to break them in the operation. They are then put into bags, and dipped in boiling water to kill them, after which they are dried in the sun; and though they lose about two-thirds of their weight by this process, more than a million and a half pounds are brought annually to Europe. Some idea may be formed of the vast number of these creatures from the fact that each pound is supposed to contain about 70,000 insects. At present the value of cochineal fluctuates from six shillings to nine shillings per pound, which is scarcely a fourth part of the price obtained during the war, when it sometimes sold so high as thirty-six shillings and thirty-nine shillings a-pound. At the present rate, Britain cannot pay less than L.200,000 annually—for what?—the dried carcases of a tiny insect!

Lac, or gum-lac, with its varieties seed-lac, lump-lac, shell-lac, &c. is also the produce of a small insect—the *Coccus ficus* of Linnæus, or the *Kermes lacca* of modern entomologists. This insect abounds in Bengal, Assam, Pegu, Siam, &c. and deposits its eggs on the leaves and branches of certain trees. So soon as deposited, the egg is covered by the insect with a quantity of this peculiar gum or lac, evidently intended to serve for a protection to the egg, and as food for the young maggot when produced. As each insect produces many eggs, and each egg has a separate envelope, the entire nest has a cellular arrangement as ingenious and compact as that of the bee. As there are myriads of these insects in every forest, the supply of lac may be said to be indefinite. In its natural state, this production is called *stick-lac;* after the cells are separated from the sticks and granulated, they are called *seed-lac;* this melted by fire, and made into cakes, becomes *lump-lac;* and the term *shell-lac* is given to this substance after it has been again liquefied, strained, and formed into thin transparent plates. Lac also yields a fine red dye, which, though not so bright as cochineal, is said to be more permanent, and is often used as a substitute. From our East India possessions we annually export about 3,000,000 lbs. of shell-lac, and 1,000,000 lbs. of lac dye; about one-half of which is, however, re-exported to Italy, Belgium, Germany, and other parts of the continent. We believe the present price of lac dye in the London market is from 2s. to 3s. per lb., though it has been known to be so high as 8s. 6d.; stick-lac sells from L.2 to L.4 per hundredweight, and shell-lac from L.3 to L.5; so that a vast sum of money must be yearly expended on the produce of this—another humble insect. The various lacs are employed in the manufacture of sealing-wax, ink, varnishes, and in hat-making.

We may here also notice the *Coccus ilicis*, or kermes—an insect from which Europeans obtained their most valuable scarlet dyes previous to the discovery of America. The kermes adhere to the shoots of the berry-bearing ilex, which is found very plentifully in many parts of Europe. They appear under the form of smooth shining grains of a brownish-red colour, about the size of peas, and covered with a fine brown powder. These grains contain the young kermes, which proceed much in the same manner as the lac insect, till they attach themselves to the young branches, and become the receptacles of a future progeny. The scarlet dye obtained from the kermes is less brilliant, but more durable than that from the cochineal; old tapestries which were dyed with it two hundred years ago having lost scarcely anything of their original vividity. It is now little used,

unless in Spain and other countries where the arts have yet made inconsiderable progress.

Known from the earliest periods of human history, and of more obvious importance than some of these dye-insects, are the various kinds of honey bee—'the little busy bee' of the poet and moralist—the permanent symbol of industry and unprocrastination. Plain-looking and humble as the common bee may appear, it divides with the silkworm the care and attention of man, and has had more books dedicated to its history and nurture than any other of the lower animals—the horse and ox perhaps excepted. At this moment we can lay our hands upon more than a score of treatises; nor does time seem to exhaust the subject, for every year is adding to our library of 'bee-books.' And after all, this attention is not more than the brown dusty-looking little insect deserves. Its honey is one of the most delicious products in nature, and along with its wax subserves numerous purposes; whilst its roaming habits assist in carrying the fructifying pollen from plant to plant, thus not only rendering fertile that which would otherwise be hopelessly barren, but creating new and approved varieties. The silkworm and cochineal insect require to be fed and cared for; the bee is a reveller in nature's common, trenches upon the store of no other creature, and converts into honey and wax what would otherwise be utterly useless. There cannot be a readier and more certain contributor to the income of the cottager than a snug little apiary, and even were it only in this light that the bee were useful, it would be deserving of all the importance with which it is invested. In Britain alone about L.120,000 is annually spent for foreign honey; and if we add to this a large home supply, and consider that in other countries the article is even more liberally made use of, we shall arrive at some conception of the economical value of the bee. But it is not the honey alone; we import 10,000 hundredweight of wax each year, and when we state that the price varies from L.5 to L.10, 10s. a hundredweight, it will be seen that its value is all but equivalent to that of honey. In Holland, the southern states of Russia, in Greece, and other countries of the Levant, as well as in America, the produce of bees forms an important item of their resources—resources, be it borne in mind, which could not be obtained by any other known means either in nature or art.

Our list would be incomplete without adverting to the insect which produces the gall-nuts of commerce, so extensively used in dyeing, in the manufacture of ink, and in other processes. These excrescences, varying from a quarter of an inch to an inch in diameter, are produced on several species of oak trees by the perforation of the female *Cynips* for the deposition of her eggs. The juices of the leaf being diverted from their proper channels by this puncture, they form a sort of wen, which increases in size, together with the larva inclosed in it. On the larva arriving at maturity, it eats its way out; hence gall-nuts are generally found with a hole in them. They are in perfection when they have acquired their full size and weight, but before the insect has pierced them; after which they become of a brighter colour and lose part of their weight. Galls are produced abundantly throughout Asia Minor from a small species of oak, but the best are those of Aleppo and Mosul, which are about the size of a nutmeg, and mostly of a bluish or gray colour, hard, heavy, and compact, with numerous small tubercles on their surface. They abound in astringent matter, or tannin, and are much used in medicine as well as in the processes already alluded to. They are imported in great quantities, and vary from L.2 to L.4 a hundredweight, according to quality.

To these insects of utility we might add the *Cantharis*, or Spanish fly, used by the apothecary in the preparation of blister ointment; as well as many others of minor value; but our limits forbid. Enough, we should think, has been adduced to prove, even to the most heedless, that insects—laying aside altogether the purposes they fulfil in the scheme of nature—are economically not the insignificant and unimportant creatures which the uninformed mind is but too apt to regard them.

THE GAUGER'S RUN.

I SUPPOSE there are few who have not heard of the demoralisation and crimes produced in Ireland by illicit distillation. In the present day there are comparatively few disorders from this cause, as the excise laws have been considerably modified, and the appetite for whisky has become less uncompromising. Some years ago, however, the people in those parts of the country where the distilling of spirits was carried on clandestinely, were at constant war with the officers of excise, and the most fearful encounters took place between them. In Donegal, where I resided with my family, we saw much more of this than was at all pleasant, and on one occasion were accidentally involved in one of these ever-occurring quarrels.

It was a very beautiful morning in June, and I was preparing to descend to the breakfast parlour, when I was startled on hearing a noise at the gate in front of the dwelling. Looking out to see what was the matter, I observed that one of the domestics was refusing admittance to a decently dressed man, who was urgently and anxiously trying to get into my premises. Hastening to ascertain the cause of the disturbance, I soon learned that the suppliant for shelter was an unfortunate excise officer—or 'gauger,' as he was called by the country people. 'Oh, for mercy's sake,' cried the distracted man, 'let me into your house; lock me up somewhere, or anywhere; hide me, save me, or I am a dead man!' I did not hesitate to bring him in, and making him sit down, I offered him refreshment, as he appeared exhausted and faint. I begged of him to recover himself, and to take courage, as there was no danger. At this moment an immense crowd of men and boys surrounded my house; and one of the men came forward to the door and demanded admission. I opened the window to inquire what he wanted. He replied, 'You have got the gauger in your house, sir, and we must have him out—we want him.' 'What do you want him for?' 'Oh, your reverence, begging your honour's pardon, that's no business of yours to meddle in; we want him, and must have him.' 'That may be, but I can't allow it: he is under my roof; he has come claiming my hospitality, and I must and will give him shelter and protection.' 'Doctor, there are two words to that bargain. You ought to have asked us before you let him in. And to be plain with you, doctor, we really respect you very much—you are an honest good neighbour, and mind your own business; and we would make the man sore and sorry that would dare to touch a hair of your head. But you must give us the gauger. To be at a word with you, doctor, we must either tear open or tear down your house, or get him; for get him we will!'

What was to be done? I could do nothing. I had no gun or pistol in the house. 'So,' says I, 'boys, you must and will, it seems, do as you like. But mind, I protest against what you are about; but since you must have your own way, as you are Irishmen, I demand fair play from you. The man inside had ten minutes law of you when he came to my house: let him have the same law still: let him not be the worse of the shelter I have given him. Do you now go back to the hill yonder, at the side of the house, and I will let him out at the hall door, and let the poor fellow have the start, giving him his ten minutes' law.'

I was in hopes that, by gaining these ten minutes, my man, who was young and healthy, would be able to reach the river Lennan, which ran deep and broad, between high and rocky banks, about a quarter of a mile off in front of the house, and, by swimming across, that he would effect his escape from his pursuers. The enemy

side agreed that the proposal was a fair one; at any e they promised to abide by it. My refugee, seeing dire necessity of the case, consented to leave his lter. I enlarged him at the hall door: the mob, true its pledge, stood on the hill about two hundred yards tant.

The gauger started off like a deer, and as a hunted r he ran his best. He cleared the first little rivulet excellent style, and just as he was rising the hilly ge which divided the smaller from the broader ain, his pursuers broke loose like a pack of hounds full chase. The huntsmen were all Highlandmen—, loose, active, young, with breath and sinew strong breast a mountain; men who many a time and o'er bog and brae, had run *from* the gauger, and they were *after* him with fast foot and full cry. m the hall door the whole course of the hunt ld be seen; they, helter-skelter down the lawn, ning swift and wild; he, trudging along, toiling up opposite hill, and straining every nerve to gain the

At length he passed the ridge, and, disappearing, ed down to the Lennan. Here, out of breath, and no to strip or hesitate, he took the water, and boldly le the plunge into the foaming river. A bad swim-, out of breath, encumbered with his clothes, the er rushing dark, deep, and rapid, amid surrounding es—the poor man struggled, and struggled on for : the enemy yelled behind him, whilst a watery re seemed to encompass him about. Frightened and austed, he had well nigh sunk for ever—another nute, and he had been a drowned man—when his suers coming up, two or three of the boldest and swimmers rushed into the river and saved him.

The huntsmen now gathered round their stricken and tive deer. They rolled the poor man about until y got the water he had swallowed out of his stomach; y dried his body with their long frieze coats; twenty ds were engaged in rubbing him into warmth. They everything which humanity could suggest to bring to life. Happily our friend had not fallen into cruel clutches of a party of Rockites, who are more eful of the life of a pig than of a human creature! ; the Donegal mountaineers had a deed to do—but a deed of death; they were about a deliberate work ut not a work of blood.

The moment the poor gauger was restored to life d in order to contribute to and hasten his recovery, ample dose of the 'poteen' he had come to prosecute poured down his throat), they proceeded to tie a dage over his eyes, and mounting him on a pony, they set with their captive to the mountains.

Removing him from place to place, during a whole r, through glens and defiles—up one mountain, and n another—at length, towards the close of a sum-'s evening, they brought him to the secluded of Glen Veagh. Here they embarked him in a ugh, or wicker boat; and after rowing him up and n the lake for some hours, they landed him on a le island, where was a hut, which had often served a shelter to the fowler, as he watched his aim at the d water-birds of the lake, and still oftener as the ill-house' to the distiller of poteen. Here was our ave led, and consigned to the charge of two trusty n—the bandage still carefully kept on his eyes. He well cared for, and fed on trout, grouse, hares, fishes, and other delicacies of the place and season; ixty of poteen, mixed with the pure water of the lake, s his portion to drink: and for six weeks he was thus s cooped up, as it were, in the dark, like a fattening ll. The period of his strange captivity being now ast to expire, his keepers one morning took him der the arm and conducted him to a boat, in which y rowed him up and down from island to island. y then brought him to the mainland, put him on a se, and again, for the length of a day, led him hither d thither, through glen and mountain, till towards ll-close of night, the bewildered but now liberated ugher finds himself alone on the high road to Letter-kenny. The poor man returned home that night to his family, who had given him over, weeks ago, as either murdered or gone to America. Yet how *changed* he stood before their eyes!—not as a grim ghost at the door, but as a well fed, fat, and happy-looking man.

Now, it may be asked, why all this mad pursuit to catch a gauger, merely to fatten him and let him loose again? The capture was a matter of important consequence to the mountaineers. A lawless deed it surely was, yet almost pardonable, seeing that the result might have produced serious consequences to the perpetrators in the district. To repress the system of illicit distillation in Ireland, amongst other enactments, there was an act passed as contrary to the spirit of the British constitution as to the common principles of right and justice—a law punishing the innocent in substitution for the guilty! This law made the townland in which the *still* was found, or any part of the process of distillation detected, liable to pay a heavy fine, to be levied on all its landholders. The consequence of this act (now repealed) was, that the whole north of Ireland was involved in one common confiscation. It was the fiscal triumph of gaugers and informers over landlords and proprietors. Acting on this anti-social and iniquitous system, the gauger of the district in question had informations to the amount of L.7000 against its several townlands. These informations were to be brought forward at the approaching assizes, and, if sustained, as no doubt they would, the result would be utter ruin to the people.

With such a prospect before them, and in the circumstances mentioned, the plot was laid for the seizure and forcible abduction of the revenue officer. It having been known that, some time previous to the assizes, the gauger was to pass through the district, on his way to the coast, and it being also known that he kept those informations about his person, the scheme was therefore to waylay him and keep him prisoner, in safe custody, out of the way and out of sight, until the assizes were over. And well and effectually the plan succeeded! The crown officer not being forthcoming at the assizes, the prosecutions, as a matter of course, fell to the ground, and the people generally were saved from loss, if not ruin. And so ended this curious case of revenue law—a law which, with other legislative abuses, helped to make Ireland very much what it is.

SCHOOLS OF INDUSTRY IN EDINBURGH.

It will be pleasing to many of our readers to know that the article on the Schools of Industry in Aberdeen, which appeared in our 98th number, has attracted the attention of numerous functionaries, civic and judicial, in different parts of the country, and partially roused them to the perilous condition of the juvenile mendicatory poor. In Edinburgh, the subject was brought under the notice of the town-council, in its capacity of parochial board, by Bailie Mack, one of the city magistrates, on the 23d of December, and some of his observations on this occasion deserve to be noticed.

Referring to what he had formerly stated on the subject, he proceeded:—'I endeavoured on that occasion to point out to you the very great evil which prevailed in this city; namely, that of young boys and girls, often destitute of parents, or of guardians of any sort, who were found prowling through the streets and lanes of the town, lodging in common stairs or outhouses all night, and occupied through the day in begging from door to door, and following and annoying the inhabitants on the streets, asking charity; and too often it had been found that these children, both in the daytime, and especially under cloud of night, were occupied in thieving and pilfering from the unsuspecting part of the community. At last they were discovered, and brought up as prisoners to the bar of the Police Court; many of them very young —from four to eight or nine years of age. In some cases, no doubt, it has been found that they had parents, but that of the most worthless description, who, instead of

instilling honest, industrious, and religious principles into the minds of their children, actually drill them, as it were, for plying the wretched vocations of begging and thieving. Indeed it is no rare sight to see the mothers of these children directing them into various places of the streets for the purpose of accomplishing the objects I have now referred to. These children are brought up in total ignorance of every right and proper principle, and well it may be said of them, as they grow up, that they have no 'hope,' and are 'without God in the world.' Independently altogether of Christian duty, self-interest will suggest the propriety of endeavouring to put a stop to the evil I have been describing. For what is it that entails upon the inhabitants of the city and the country generally the very large sums with which they are taxed for the support of prisoners, and for defraying the expenses incurred in the criminal prosecutions of these juvenile offenders? It is the neglect of those unfortunate children at the outset—no attention is paid to them till they imbibe the most wicked propensities, and are almost beyond the reach of humanity; whereas, if the evil were nipped in the bud—if they were taken charge of, educated, and taught to work at some industrial exercise, we should no doubt put a stop to the heart-rending scenes daily exhibited in the streets and criminal courts of this city. What is the daily practice at present in reference to the prosecution of these juvenile offenders? There is a sort of routine that is gone through with regard to them; they are first of all punished several times by imprisonment, under the sentences of the magistrates and judges of the Police Court; then they are indicted and tried in the Sheriff Court; and ultimately they are indicted and tried in the High Court of Justiciary; and it is no unusual sight to see, on a Monday in that court, three or four of the supreme judges, a jury, the lord-advocate or solicitor-general, and so many depute-advocates, macers, &c. &c. engaged in trying two or three young urchins for stealing a few *empty* bottles or the like (for it matters not what the crime is, they have gone through the *curriculum* I have narrated, and they are now in the court of the last resort); and preparatory to this trial, and after all the costs of the proceedings in the inferior courts, only consider what an enormous expense the country is put to in one of these trials in the High Court of Justiciary. There is first a precognition taken by the Procurator-Fiscal; that is sent by him to the crown agent for his perusal; by him the case is sent to the crown lawyers; an indictment is then prepared by one of these gentlemen; it is printed and executed; a jury is summoned, consisting of special jurors and common jurors to the number of sixty-five, taken from the city, the town of Leith, the county of Edinburgh, the county of Linlithgow, and the county of Haddington; many of them travelling a great distance, at great inconvenience, and at considerable expense, all for the purpose of taking their part in a trial of the description I have now given you. Witnesses are also in attendance from various parts of the country; and I believe that, upon an average, each of these trials costs the country little short of L.200 sterling, when you take into account all the preliminary steps necessary previous to the trial taking place. Now observe, I throw out no reflections against the honourable and learned judges who preside at those trials, or against the gentlemen who are engaged in their preparation: quite the reverse: all of them, I have no doubt, will cheerfully approve of and support any scheme which can be devised by which, in future, such proceedings, in regard to those unhappy youths, will be rendered unnecessary. I am quite aware, however, that to put a stop to this state of matters will be no easy task, and that a number of my friends will be thinking that I am engaged in a wild enterprise; but still I think the remedy is practicable, and at all events ought to be tried; and I am the more convinced of this, from seeing what has been done in the city of Aberdeen, as described in a late number of Chambers's Edinburgh Journal. Now, I would respectfully propose that similar schools should be instituted in this city. It will be for the committee to be appointed to arrange the details; in the meantime, I would suggest the following:—

1st, The Parochial Board to open an Industrial School, on the plan of the Aberdeen Industrial School, for children of both sexes between the ages of five and fourteen.

2d, The following classes of children to be admitted:—First, 'poor children, who are themselves, or whose parents are, the objects of parochial relief;' second, such children, not included in the foregoing, as are taken there by the police for begging (the alternative offered to the child being imprisonment), their cost to be paid, if practicable, out of the police assessment; third, such other children as may be sent at the cost of private parties, or can be paid for out of any fund placed at the disposal of the committee of management.

3d, The schools to be conducted on the most rigid system of economy (consistently with efficient superintendence and wholesome diet), and to be made, as far as possible, self-supporting. Perhaps I may add that, as soon as practicable after the establishment of this school, another Industrial School, to be opened by private subscription, for the children of labourers—the parents being required to pay the whole expense beyond the value of the children's labour, except that which is incidental to the new experiment.

In proposing every scheme of this kind, I am aware that the first question which will be asked is, 'Where are the funds to come from?' In the first place, I may mention that a considerable sum will be raised by private subscription; for since I first mooted this question, I have been waited upon by several wealthy and influential gentlemen in the city, who have expressed their readiness to contribute to its support. But secondly, under the new poor-law bill, the Board are entitled to assess the inhabitants for the expense of at least one of the schools I have been proposing. By the 69th section of the act, it is *inter alia* enacted—'And it shall be lawful for the Parochial Board to make provision for the education of poor children, who are themselves, or whose parents are, objects of parochial relief.'

Bailie Mack concluded by proposing to remit the subject to a committee, which, after some discussion, was finally agreed to. It is therefore now under the consideration of a committee of the board, where we trust it will speedily be brought to an issue.

THE KERGUELEN'S LAND CABBAGE.

SITUATED in the centre of the Southern Ocean, and more remote than any other island from a continent, is Kerguelen's Land, or the Island of Desolation, discovered by Captain Kerguelen in 1772. It is about 100 miles in length and 60 in breadth, and seems to be chiefly composed of trap and other volcanic rocks, which rise into hills from 500 to 2500 feet high. The coast is deeply indented with bays and inlets, and the whole surface is intersected by lakes and watercourses. Owing to the coldness and moisture of the climate, the island is almost totally destitute of vegetation, and is generally spoken of by navigators as one of the bleakest and most desolate spots on the globe. Scanty, however, as its vegetation undoubtedly is—for Dr Hooker, during the recent Antarctic voyage, could detect no more than eighteen species of flowering plants on its soil—there is at least one of these species highly interesting, not only from its being peculiar to the island, but from its wholesome and valuable properties. This is the 'Kerguelen s Land cabbage' of the illustrious Cook—the *Pringlea antiscorbutica* of the systematic botanist.

The *Pringlea*—so named by the naturalist to Cook's first expedition, in honour of Sir John Pringle, who wrote a book on scurvy—belongs to the cruciferous order of plants, which includes the cabbage, mustard, horse-radish, turnip, and other genera; all less or more possessing pungent, antiscorbutic, and nutritive pro-

perties. It is described in the Flora Antarctica* as exceedingly abundant over all parts of the island, ascending the hills up to 1400 feet, but only attaining its usually large size close to the sea, where it is invariably the first plant to greet the voyager, like the scurvy grass upon many northern coasts. Its root-stocks, often three or four feet long, lie along the ground, and are sometimes two inches in diameter, full of spongy and fibrous substances intermixed, of a half-woody texture, and with the flavour of horse-radish. These bear at their extremities large heads of leaves, sometimes eighteen inches across, so like those of the common cabbage (*Brassica oleracea*), that if growing in a garden with their namesakes in England, they would not excite any particular attention. The outer leaves are coarse, loosely placed, and spreading; the inner form a dense white heart, that tastes like mustard and cress, but is much coarser. The whole foliage abounds with essential oil of a pale yellow colour, and highly pungent taste. 'During the whole stay of the Erebus and Terror in Christmas Harbour,' says Dr Hooker, 'daily use was made of this vegetable, either cooked by itself, or boiled with the ship's beef, pork, or pea-soup. The essential oil gives a peculiar flavour, which the majority of the officers and crew did not dislike, and which rendered the herb even more wholesome than the common cabbage, for it never caused heartburn, or any of the unpleasant symptoms which that plant sometimes produces. Invaluable as it is in its native place, it is very doubtful whether this plant will ever prove equally so in other situations. It is of such slow growth that it probably could not be cultivated to advantage; and I fear that, unlike the cow-cabbage of Jersey, it would form no new heads after the old ones were removed, even if it would survive the decapitation. Growing spontaneously, and in so great abundance where it does, it is likely to prove, for ages to come, an inestimable blessing to ships touching at this far distant isle; whilst its luxuriance amidst surrounding desolation, its singular form and appearance, striking even the casual observer, and the feelings of loneliness and utter isolation from the rest of the world that must more or less oppress every voyager at first landing in its dreary and inhospitable locality, are circumstances likely to render the Kerguelen's Land cabbage—cabbage though it be—a cherished object in the recollection of the mariner; one never to be effaced by the brighter or luscious products of tropical vegetation.'

After this description of the character and uses of the *Pringlea*, Dr Hooker offers some speculations as to its anomalous position and likely origin. 'The contemplation of a vegetable,' says he, 'very unlike any other in botanical affinity and in general appearance, so eminently fitted for the food of man, and yet inhabiting the most desolate and inhospitable spots on the surface of the globe, must equally fill the mind of the scientific inquirer and common observer with wonder. The very fact of Kerguelen's Land being possessed of such a singularly luxuriant botanical feature, confers on that small island an importance far beyond what its volcanic origin or its dimensions would seem to claim; whilst the certainty that so conspicuous a plant can never have been overlooked in any larger continent, but that it was created in all probability near where it now grows, leads the mind back to an epoch far anterior to the present, when the vegetation of the Island of Desolation may have presented a fertility of which this is perhaps the only remaining trace. Many tons of coal and vast stores of now silicified wood are locked up in or buried under those successive geological formations which have many times destroyed the forests of this island, and as often themselves supported a luxuriant vegetation. The fires that desolated Kerguelen's Land are long ago extinct, nor does the island show any signs of the recent exertion of those powers, that have at one time raised part of it from the bed of the ocean with those submarine algæ which carpeted its shores, but which are now some hundred feet above the present level of the sea. The *Pringlea*, in short, seems to have led an uninterrupted and tranquil life for many ages; but however loath we may be to concede to any one vegetable production an antiquity greater than another, or to this island a position to other lands wholly different from what it now presents, the most casual inspection of the ground where the plant now grows, will force one of the two following conclusions upon the mind: either that it was created after the extinction of the now buried and for ever lost vegetation, over whose remains it abounds; or that it spread over the island from another and neighbouring region where it was undisturbed during the devastation of this, but of whose existence no indication remains.'

It is certainly a curious fact in vegetable geography, that this distant and desolate island should be the only spot on the globe where a plant of such eminent utility is to be found; and equally strange that no known vegetable production bears any generic affinity to the *Pringlea*. Its origin, however, need not excite any extraordinary marvel, seeing that numerous centres of dispersion are now admitted by naturalists, and that new creations and developments are quite admissible, and in the strictest harmony with the general design of creation. It is not likely that the *Pringlea* has outlived all the geological changes, the various submersions and elevations which have taken place, since the plants of which Dr Hooker speaks were converted into silex and coal; and it is as unlikely that its seed was drifted from some adjacent island or continent now submerged, seeing that the whole surrounding region is geologically contemporaneous with Kerguelen's Land itself. The only plausible theory is that of a new creation or development—a gradation it may be of some humbler and marine form into that of the terrestrial *Pringlea*. A development of higher forms from marine vegetation has been hinted by several botanists; and considering the adaptability of vegetable life, there is nothing to forbid the hypothesis that the Kerguelen cabbage may have sprung from such a source. Be this as it may, the existence of the plant is a curiosity in the history of vegetation, and all the more striking that its properties are so eminently useful.

* Hooker's Flora Antarctica, parts xii. and xiii.

A DAY AT CREWE.

[From the Liverpool Journal.]

Some twenty years ago, a gentleman, who was a special attorney from Nantwich, found his way by the quiet service of his bay cob to the Oak Farm, near the ancient and obscure village of Coppenal. His inspection of the house and lands was curious and professional; and although the one was old and dilapidated, and the other boggy and rushy, he seemed to imbibe a liking for them, and in ten days from that date he was the owner of the neglected freehold.

The sages of the neighbourhood, who never met but on Sundays at church, heard that he was silly enough, uncommon silly for a lawyer, to give the extravagant sum of L.35 an acre for the estate of about sixty acres. Everybody said that the price was extravagant; and his friends advised him to sell it at a loss. But he had taken a liking to the place: its retirement offered an asylum to old age; and in place of selling, he kept adding to the farm by the purchase of adjoining little freeholds, until his estate ultimately reached the number of one hundred Cheshire acres.

To the surprise of the hind who looked after Oak Farm, one fine morning in summer a gentleman, evidently a stranger, arrived on the ground, attended by three men, who placed for his convenience a magical kind of instrument on three legs for him to look through, and at each remove, like Goldsmith's traveller, dragged a length of chain. In a wondrous hurry he saddled 'Dobbin,' and by dint of whip and spur, which he called hay and oats, he reached Nantwich in an hour and three quarters. The worthy attorney, to Lubin's surprise, rubbed his hands mirthfully, ejaculating, 'All right—a railway!'

In due time that most discreet and able of engineers,

Mr Locke, had levelled the line of the Grand Junction. It passed through Oak Farm. By act of parliament the proprietor was paid for all land encroached on and used, and already chance had given the attorney for a portion much more than he paid for the whole. Fortune's frolic continued to enrich him. The people of Chester would have a short cut to London, and their line came out at Crewe, exactly across Oak Farm. The Manchester people, equally impatient of delay, took another short cut in another direction, coming out also at Oak Farm. They paid compensation, and the Nantwich attorney was now a fortunate man.

The Grand Junction Company, desirous of removing their works to a central position, selected Crewe. They wanted thirty acres for their workshops, and fifty acres more for the habitations of their workpeople; and Oak Farm was laid out as a city for mechanics. Speculators drew near; the estate was nearly disposed of, the owner receiving some L.500 per acre for what originally was too dear at L.35. The worthy solicitor was in due time gathered to his fathers, and his children now inherit after him.

In common with our contemporaries, we have reported progress, from time to time, at Crewe, up to the time of their final completion; and lately we paid a visit to this model town and locomotive depôt. Unexpectedly, we met here an old acquaintance, Mr Owen Owens, now superintendent of the wagon department; and our curiosity profited largely by that kind courtesy and fulness of information which now enables us to lay before our readers a description of Crewe.

The town of Crewe is a creation of the last six years. It now numbers about 2000 inhabitants, and occupies the acute angle formed by the junction of the Crewe and Grand Junction railways. The buildings are all new designs by Mr Cunningham, and erected by Messrs Samuel and James Holme; and it is hardly necessary to add, that those gentlemen profited by an opportunity seldom afforded to others, to exhibit all the resources of taste and skill in the formation of what in strict accuracy may be called a model town. Elaborate decoration was not required; but art revealed itself in imparting beauty to dwellings of labourers; and an endless variety give a pleasing appearance to houses which less cultivated judgment would have rendered sombre, because uniform.

The dwelling-houses arrange themselves in four classes: first, the villa-style lodges the superior officers; next, a kind of ornamented Gothic constitutes the houses of the next in authority: the engineers are domiciled in detached mansions, which accommodate four families, with gardens and separate entrances; and last, the labourer delights in neat cottages of four apartments, the entrances within ancient porches. The first, second, and third, have all gardens and yards; the fourth has also gardens; and, to the credit of the labourers, one of them, at the recent floral show, carried away the prize.

The rooms are all capacious: the ground-floors are tiled, and, as the back and front are open, ventilation is perfect. Each house is supplied with gas; the water is always on at present in the street, but is to be immediately introduced into the houses. The engineers, &c. pay 3s. 6d. a week, the labourers 2s. For water there is no charge, but for gas they pay in winter twopence per week for each burner. The fittings cost them nothing. There are baths, playground, news-room, library, schools, and assembly-room. They pay one penny each for a bath when they use it, subscribe for papers and books, and pay twopence a week for each child's schooling. The company provide clergymen—one of the church of England, one of the church of Scotland—and pay L.50 a year to the surgeon, Mr Edwards, who contracts with the community at threepence a week for each family, medicine included; and the wisdom of the arrangement is implied in the fact, that, since his appointment, there has not been a single death in the town—previously there were several.

The men are all well and regularly paid, and it is impossible to imagine circumstances better calculated to promote their happiness. And they are happy. It is delightful to hear them speak of the directors, and the officers over them. In their estimation there is no company like the Grand Junction Company—no workshops like the workshops at Crewe—no workmen like themselves. Mr Trevithick, the superintendent engineer, is second only to his celebrated father, and his father was the greatest engineer who ever lived; Mr Allen, of the locomotive department, has introduced more improvements than any other man in the kingdom; Mr Worsdell, of the coaching department, is worshipped alike for the excellence of his taste and the goodness of his heart; and Mr Owens is one of those favourites whose disposition to oblige is laid under eternal obligations, but never thought such. In their opinion—and all who know his solicitude agree with them—Mr Norris has made the Grand Junction the safest line in the world; and they are all perfectly assured that nothing could by possibility happen between Liverpool and Birmingham, without being instantly known to Captain Huish. In his intercourse with them, it is pleasing to observe how nicely they appreciate that perfect gentlemanly bearing which gives a charm to courtesy, preserving its distance without leaving any impression of inferiority. They look upon him and Mr Norris, no doubt from long experience, as protecting friends, on whom, while deserving, they may firmly rely.

Crewe has a town-council, popularly chosen. They sent twenty names to the directors, who selected twelve, from whom they were to select nine: they did so, and the company added three. These representatives manage all municipal matters. They regulate the library, news-room, festivals, &c. They have no criminals. A new church is on the point of completion. It is built with blue or variegated brick, in the style of early Norman, with tower, transept, &c. and is most comfortably fitted up inside. It occupies the centre of an open space, and on the left are the boys' school, the girls' school, and the infants' school. In the boys' school we saw lads under twelve drawing most careful and accurate outlines of locomotives; and in the girls' school we were gratified with the sight of about sixty of the most healthy children we ever saw. There was an air of grace about them, indicative of good-breeding and intelligence; several of them were, indeed, quite beautiful. Their fair teachers exhibited, with considerable pride, proofs of their skill; and they sang with an attention to time which bespoke the care of their instructor. Music is a resource at Crewe, and the community is happy in the presence of Mr Jones, who excels on a dozen different instruments. His wife proudly observed, 'that if he was as big as he was clever, he would be a great man.'

The day is still young, and we enter the workshops. They cover no less than thirty acres, in the more acute portion of the angle. On the right, you turn into a large apartment fitted up for building new wagons; it opens into another still larger, and here wagons are repaired. Further on is the forge where the iron work of Mr Owen's department is executed. The fan is used instead of the bellows; but here, as in all the other smithies, bellows are erected in the event of the fan failing. Turning round from the wagon department, you enter the coach-building room, in continuation of which are the repairing shop and smithy attached. You see here the process of coach-making, from the first frame to cunning device in heraldry, which finishes the vehicle with an aristocratic attribute. One of the heraldic painters, Mr Fisher, is no mean artist. We were shown a portrait taken by him, in which the likeness was perfect, and the artistic skill broad, large, and beautiful. The colouring was not its least recommendation—there was an academic look about it.

The next great wing of the building is devoted to the locomotive department. It presents the aspect of a vast polytechnic institution: all the vast implements of engineering science seem gathered together here. Planing machines of all forms and sizes fill up the centre, connected with endless straps to a power-transmitting drum; while on either side were lathes, punching, shearing, and cutting machines. All were in motion, certainly not noiselessly; but they seemed almost instinct with life, for they did, unbidden, their various duties. In the extreme wing is the brass foundry and brass work, where men with 'patient touches of ingenious art' fashion metal into forms of beauty.

Adjoining is the locomotive waiting-room, about as large as St Martin's market, where engines are kept always ready under steam pressure in case of accident, and where all undergo examination. A new one was under trial, and it afforded us an opportunity of examining some recent improvements of Mr Allen's.

Not the least marvellous thing about this extensive establishment was the fact, that the power which moved all the machinery throughout the buildings, covering thirty acres, was transmitted from one steam-engine of 20-horse power, worked on the Cornish or expansive principle. The

arrangements secure the most perfect division of labour, and although six hundred men are employed, there was a total absence of bustle, hurry, or confusion. Each man, like the machinery, seemed to fall naturally into his own place.

But hark! the steam-whistle announces the approach of the train which is to carry us from Crewe.

Column for Young People.

AN UNCLE'S PRESENT.—BY MADAME GUIZOT.

[Madame de Boissy and Caroline at work.]

Madame de Boissy.—Caroline, do you need that sash which you got from your uncle a little while ago, by asking him to lend you the money to buy it?

Caroline.—I am very glad to have it, mamma, as it cost me nothing.

M. de B.—Did you know then that your uncle would make you a present of it?

Caroline.—Mamma, I only asked him to lend me the money.

M. de B.—I know that; but did you intend to pay him?

Caroline.—Certainly, if he would take payment from me.

M. de B.—But did you think he would take it?

Caroline (*confused*).—I do not know, mamma.

M. de B.—Tell me candidly, when you asked your uncle to lend you the money to purchase that sash, which you did not need, and which you would probably not have bought had you been alone, did you not know that it was the way to make him give it to you?

Caroline.—Dear me, mamma, you are making me examine my conscience so very rigorously.

M. de B.—That is the way it should always be examined, my child.

Caroline.—Yes, when one has done anything wrong.

M. de B.—Or to know whether one has done so.

Caroline (*agitated*).—But what harm can I have done? My uncle was his own master, and it was quite true that I had no money in my pocket.

M. de B.—There is, however, one thing which you wished him to believe, that is not true; and that is, that you really intended to buy the sash with your own money.

Caroline (*still agitated*).—But, mamma, my intentions are nothing to any one.

M. de B.—Apparently you fear they are something, as you endeavour to conceal them. You did not wish your uncle should guess them; therefore, when you were thinking of one thing, you tried to make him believe another. You would not ask him to give you this ribbon, because you know that, in making a present, one party should feel as much pleasure in giving, as the other would have in receiving: you wanted your uncle to believe that you had the delicacy not to wish for a present, which he had no thoughts of giving you, while at the same time you took a round-about method of making him give you one. You tried to obtain both the esteem which delicacy deserves, and the present which must have been sacrificed to merit it. It is clear, then, that the one or the other does not belong to you, and that you have therefore stolen into the bargain.

Caroline (*quite shocked*).—Oh! mamma, one does not steal except when he does an injury to some person, and I have done no harm to any one.

M. de B.—You have extorted a present from your uncle, which in all probability he would not have made except to a person whom he believed incapable of subterfuges. You have cheated him out of the intention he had, of giving you an unexpected pleasure.

Caroline.—He cannot know that, and therefore his pleasure will not be lessened.

M. de B.—Caroline, would you not think it stealing, were you to take money from the coffers of a rich man who was making no use of it, and did not even know the amount? If you did not do him an injury that he could himself feel, you would do it to those to whom this money would afterwards revert, and who might not have either the same wealth or the same indifference. In like manner, if you do no positive injury to your uncle by usurping a place in his esteem which is not your due, you do it at least to those whom he may hold in an equal, or in a less degree of regard, than yourself; for you either share with them an esteem you do not merit, or you deprive them of the advantage they might derive from that high example which would justify to them your uncle's preference. Impress it well upon your mind, that you can never be guilty of fraud without doing injury to some one, and that we can have no unjust acquisition that is not taken from our neighbour.

Caroline.—But indeed, mamma, that is a very trifling one.

M. de B.—The occasion is trifling, but the principle is the same; and you should no more steal needles than you would diamonds. Besides, my child, what people take the trouble of stealing, they must set some value on, or expect to derive some advantage from it; and who would wish to obtain an advantage they did not deserve? Listen to me, Caroline: you are no longer a little child, and it is time for you to know that the most perfect integrity, even in the smallest matters, is what you owe both to yourself and to others: and how very humiliating it is to try to deceive, or to think it necessary to do so.

Caroline.—Mamma, I never tried to deceive any one, I assure you.

M. de B.—I can well believe that there is no person who will acknowledge that it is their direct intention to deceive; but without saying things that are absolutely false, people pass their lives in trying to make others believe what is not true: thus, if they are cold, or warm, or fatigued, they exclaim about what they suffer; they exaggerate in order to draw attention or to excite pity; they laugh more than is natural when they wish to be thought gay; they will go to a glass and exclaim, 'How the sun has already tanned me!' in order that some one may compliment them on their complexion; or they will complain of a dress fitting badly, and say, 'What a figure I am to-day!' in hopes of hearing some flatterer say that everything becomes them; they will express a good sentiment in order to obtain commendation for it.

Caroline.—But, mamma, if the sentiment be true?

M. de B.—My dear, there is always a want of integrity in the means people make use of to obtain praise; for good sentiments are not given us that we may be admired for them, but that they may influence our conduct; they are of no value unless they accomplish this object. We could not admire the liberality of a person who only gave to obtain praise, or the fraternal feelings of him who only displayed them that it might be said how kind he was to his brothers and sisters. Besides, when people give utterance to fine sentiments in order to excite admiration, they take great care that it should not appear to be with that intention; and therefore, whatever commendation they receive, it is evident that it has been dishonestly obtained.

Caroline.—But then people would have to watch over every impulse of their mind, for those kind of things escape us without our thinking of them.

M. de B.—To prevent their escaping us, it will be only necessary that we keep two or three things in mind: first, that it is a proof of having very little respect or consideration for ourselves to descend to deceive others into paying us attention; next, that we place ourselves in a very humiliating position with respect to them, by begging a compliment or a commendation, which is only given out of mere politeness, or to oblige us, just as people give a halfpenny to a beggar in the street; and lastly, that those sort of artifices, when discovered (and they are discovered oftener than people think), cover them with ridicule, and even with shame; and that the smallest degree of falsehood always exposes us to a risk much greater than any pleasure it can procure. Tell me, Caroline, will your sash ever give a satisfaction equivalent to the grief you would feel were your uncle to discover the subterfuge you made use of to obtain it?

Caroline.—Oh! mamma, you have given me quite an aversion to it; I will never look at it again.

M. de B.—There you are wrong, my child. You must look at it, and think of it, that it may recall to your mind the necessity of always acting with uprightness.

FIDELITY OF THE DOG.

The Almighty, who gave the dog to be the companion of our pleasures and our toils, hath invested him with a nature noble and incapable of deceit. He forgets neither friend nor foe; remembers, and with accuracy, both benefit and injury. He hath a share of man's intelligence, but no share of man's falsehood. You may bribe a soldier to slay a man with his sword, or a witness to take life by false accusation, but you cannot make a hound tear his benefactor. He is the friend of man, save when man jus his enmity.—*Sir Walter Scott.*

THE BUSHMEN OF SOUTH AFRICA.

We glean the following account of the character and manners of this wandering race from a paper read by Mr Ruxton at a late meeting of the London Ethnological Society:—The Bushmen inhabit the almost inaccessible valleys of the Snewberg and Neuweldt, and the desolate tracts of Karoo, or desert, extending from the northern boundary of Cape Colony northward nearly to the tropic. Of the human race, the condition of these poor outcasts is perhaps the most desolate and forlorn. The appearance of locusts and other insects, by mankind in general considered a plague, is by them regarded as the greatest blessing, the larvæ being sought for as a luxury. Even a slight intercourse is favourable to the morals of this people; and that their habits are warlike, is proved by the fact, that in the year 1510, Francisco Almeida, the first Portuguese governor of India, was defeated and killed by them on the Salt river, the site of the present Cape Town. In 1652, when the Dutch took possession of the Cape, the Bushmen were very numerous, and in possession of large herds of cattle, which gradually diminished as their intercourse with the whites increased. Indeed, as the colony became settled, barter for cattle was dispensed with for forcible possession; a system of persecution which drove them from desert to desert, 'their hand raised against every man, every man's hand against them.' Although inferior in stature to the Hottentots—for they rarely exceed five feet—their limbs are symmetry itself. Spare in form, the figure in youth is light and elegant, the chest round and capacious, and the foot and hand perfect. The excessive inward curvature of the spine, and the extraordinary development of the hip, are common to the Bushman and Hottentot, but more strongly marked in the former. They differ in feature, moreover, from the Hottentot. The complexion is of a yellowish-olive, or the colour of a faded beech leaf. The hair grows in small detached patches or lines of tufts, and is sparingly distributed over the head. In texture it resembles singed wool. It is not cut, but, on reaching a certain length, frizzles at the ends into a little ball, which drops off. The eye resembles that of the Chinese, while the facial angle is that of the Australian. The Bushman is a cheerful and exceedingly active person, and his power of endurance considerable. A simple windbreak forms the only shelter from the weather. Their clothing consists of a karop, or skin, thrown over their shoulders, and a smaller one twisted around their loins. Their weapons are a short heavy club, a bow and poisoned arrows, and the assagai, or dart, which they hurl with great dexterity and precision. Their mechanical skill is very respectable, as shown in their mats, fishing nets, and implements of war.

POSTPONING A DUEL.

The Newhaven Herald says that a correspondence is now going on between two gentlemen of Boston, which began ten years ago with a challenge. Mr A., a bachelor, challenged Mr B., a married man with one child, who replied that the conditions were not equal, that he must necessarily put more at risk with his life than the other; and he declined. A year afterwards he received another challenge from Mr A., who stated that he too had now a wife and a child, and he supposed, therefore, the objection of Mr B. was no longer valid. Mr B. replied that he had now two children; consequently the inequality still subsisted. The next year Mr A. renewed his challenge, having now two children also; but his adversary had three. This matter, when last heard of, was still going on, the numbers being six to seven, and the challenge yearly renewed.—*United States Journal.*

NATIONAL PREJUDICES.

In estimating the worth of nations, justice requires that, while their vices are put into one scale, their virtues should as conscientiously be poised in the other. Individuals and nations are equally stung with a sense of wrong when their crimes are acrimoniously recapitulated, and their great and good actions are all forgotten. This fatal forgetfulness is the origin of that rancour which has so long desolated the earth. It distracts private families, confounds public principles, and turns even patriotism itself into poison. Let those who have but the smallest love for the happiness of mankind, beware how they indulge this pernicious propensity. He who in every man wishes to meet a brother, will very rarely encounter an enemy.—*Holcroft.*

PRAYERS FOR ALL MEN.

FROM 'LES FEUILLES D'AUTOMNE' OF VICTOR HUGO.

I.

My daughter, go and pray! See, night is come:
One golden planet pierces through the gloom;
  Trembles the misty outline of the hill.
Listen! the distant wheels in darkness glide—
All else is hushed; the tree by the roadside
  Shakes in the wind its dust-strewn branches still.

Day is for evil, weariness, and pain.
Let us to prayer! calm night is come again:
  The wind among the ruined towers so bare
Sighs mournfully: the herds, the flocks, the streams,
All suffer, all complain; worn nature seems
  Longing for peace, for slumber, and for prayer.

It is the hour when babes with angels speak.
While we are rushing to our pleasures weak
  And sinful, all young children, with bent knees,
Eyes raised to Heaven, and small hands folded fair,
Say at the self-same hour the self-same prayer
  On our behalf, to Him who all things sees.

And then they sleep. Oh peaceful cradle-sleep!
Oh childhood's hallowed prayer! religion deep
  Of love, not fear, in happiness expressed!
So the young bird, when done its twilight lay
Of praise, folds peacefully at shut of day
  Its head beneath its wing, and sinks to rest.

II.

Pray thou for all who living tread
  Upon this earth of graves;
For all whose weary pathways lead
  Among the winds and waves;
For him who madly takes delight
In pomp of silken mantle bright,
  Or swiftness of a horse;
For those who, labouring, suffer still;
Coming or going—doing ill—
  Or on their heavenward course.

Pray thou for him who nightly sins
  Until the day dawns bright—
Who at eve's hour of prayer begins
  His dance and banquet light;
Whose impious orgies wildly ring,
Whilst pious hearts are offering
  Their prayers at twilight dim;
And who, those vespers all forgot,
Pursues his sin, and thinketh not
  God also heareth *him*.

Child! pray for all the poor beside;
  The prisoner in his cell,
And those who in the city wide
  With crime and misery dwell;
For the wise sage who thinks and dreams;
For him who impiously blasphemes
  Religion's holy law.
Pray thou—for prayer is infinite—
Thy faith may give the scorner light,
  Thy prayer forgiveness draw

D. M. M.

CHAMBERS'S EDUCATIONAL COURSE.

W. AND R. CHAMBERS have just added to this series of works for use in schools and for private instruction—

ATLAS OF MODERN AND ANCIENT GEOGRAPHY, consisting of thirty-four maps, 4to., coloured in outline, from the latest authorities; with a copious Index, which will be found of great service in school instruction. Price, bound in cloth, 10s. 6d.

INTRODUCTION TO ENGLISH GRAMMAR; by A. J. D. D'ORSEY, Master of the English Department in the High School, Glasgow. Price, bound in cloth, 1s. 3d.

These, as well as all other works in the series, may be obtained from W. and R. CHAMBERS, Edinburgh, and 98 Miller Street, Glasgow; W. S. ORR and Co., Amen Corner, London; or from any bookseller.

Published by W. and R. CHAMBERS, High Street, Edinburgh (also 98, Miller Street, Glasgow); and with their permission, by W. S. ORR, Amen Corner, London.—Printed by BRADBURY and EVANS, Whitefriars, London.

CHAMBERS'
EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 110. New Series. SATURDAY, FEBRUARY 7, 1846. Price 1½d.

THE NEW PLANET.

The newly-discovered planet, Astræa, is a companion of the four little ones ascertained, about forty years ago, to exist between Mars and Jupiter, all revolving at nearly equal distances from the sun. If it be no bigger than the smallest of these, it probably is not forty miles in diameter, or possessed of a surface measuring more than the United Kingdom of Great Britain and Ireland. Think of a tight little island in this spherical form, wheeling along in independent fashion through space, with all its proper features of vegetation and of animated being—a perfect miniature of those respectably-sized orbs of which our own is a specimen! And supposing there are men and women upon it, think of the miniatures of nations which they must compose, and of all their other social arrangements in proportion!

In that case, a piece of land the size of four or five English counties will be a goodly continent, and a mass of sea like the Firth of Forth a perfect Mediterranean. A range of hills such as those of Derbyshire will be as a set of Alps or Himalayas to the Astræans, and their Danubes and Amazons will be about the size of our best Scotch *burns*. Rutlandshire would be a large edition of the Russian empire in Astræa. The more common-sized kingdoms would be about the magnitude of our ordinary parishes. It is inconceivable, however, that the people of this little planet are split up into nations so extremely small. Let us rather suppose that they form but four or five in all, each occupying as much land as about half the Isle of Wight. Some quarter of a million in all they might be, allowing that the land in Astræa is for the most part fit to produce sustenance for human beings. Narrow as is that field of existence, and limited its population, there will no doubt be room for the display of human passions in Astræa. It will have its wars occasionally. A Frederick the Great will set all its Europe in a flame, for possession of a Silesia of the size of the Regent's Park. An Alexander, having invaded an India resembling Cornwall in extent, will sigh, and with something like reason, to think that there are no more world's to conquer. There will be class interests too. Some little Britain will make fierce resolves to raise all its own corn, under whatever difficulties, and at whatever cost; and treaties will be entered into as between Jersey and Guernsey for an exchange of wine against woollen cloths, let the rest of the forty-mile world pine at the arrangement as it pleases. Colonies, too, will not fail to raise a pother. There will be an Algiers of parish size, with an Ab-del-Kader storming for its defence; and two mighty countries, representing a Britain and an America, will spurt out big words about an Oregon of the extent and value of the Moor of Rannoch.

The Astræans, although their world is so little, will see it to be a firm and stable thing beneath their feet, with all the other bodies of space revolving round it. If not yet arrived at the use of the telescope, and of the rules of geometry, they will believe their sphere to be the great central world, to which everything else is subordinate. But even if they have advanced as far in these matters as ourselves, they will think and speak on the understanding that Astræa is *the world*—the only place where they know for certain there are human beings—all the other spheres being only conjecturally scenes of life. Even to those most enlightened on such points, the immediateness of their own little globe will give it an importance and a centrality which they will scarcely be able to attribute to any other mass within their range of observation. There will be a great deal of self-esteem in the Astræans respecting their poor little humming-top of a world. They will look upon themselves, doubtless, as very high intelligences, and great will that man think himself who becomes known for his acts or words to one-fourth of them. He will also esteem himself a most liberal-minded and cosmopolitan person, who advocates that the five great countries should live at peace with each other, and that statesmen should legislate impartially for the good of the whole people of the globe. They will have on record their first circumnavigators and discoverers of countries; their Drakes, and Frobishers, and Columbuses; the men of giant-heart, who ventured upon untraversed seas of the width of the straits of Calais, and dared to put a girdle round a globe no less than a hundred and twenty miles in circumference. They will also have their great men of philosophy, of letters, and of arts. Would it not be curious to get a peep into one of their biographical dictionaries, and see what sort of men had been the Astræan Homer and Milton, the Astræan Socrates and Newton, the Astræan Phidias and Raphael? Their universal history would be not less amusing! What narrations of conquests pushed over the space of one of our degrees of latitude; and how interesting to trace civilisation as arising in a certain parish-like space of ground, and then spreading slowly into the adjacent parishes! Great notions entertained, too, about the origins of all those little nations; some sprung from demigods, no less. One particularly great people, convinced that they were destined to be the leading people in the world, because they were twenty thousand more in number than any other. A Napoleon in Astræa—what a droll phenomenon! Think of him setting out with the idea that his country—la Belle something—measuring about ten miles each way, was destined to predominate over the world. And behold him then overrunning his little Italy, Austria, Prussia, in succession, and thinking he had it all safe. But behold, he is at length led by constant success into an enterprise where nature happens to be against him, and he sinks more rapidly than he rose. Then histories,

poems about him, wondering at the vastness of a genius which grasped at a dominion embracing perhaps as much ground as belonged to the king of the East Saxons. Deplorations for so great a spirit, pining like the chained eagle on an islet, wretched as a toy-disappointed child, because he could not be allowed any longer to play the conqueror! He left a name at which the world grew pale—this forty-mile world, to wit—to point a moral and adorn a tale. And yet this, however whimsical it may look from our eight-thousand-mile globe, would undoubtedly be very serious to the Astræans. For just as Astræa is to us, so is the earth to a planet like Jupiter or Saturn, where men may be speculating about our Tellurian history exactly in the present strain, although, as is well known, we regard our Napoleon as something very tremendous.

It is possible, after all, that the Astræans have a more just view of themselves and their world in comparison with other worlds and other peoples. They may be, perchance, a more modest example of human nature than their earthly brethren; and it may have therefore happened that when they first learned, from their Copernicuses, Newtons, and Herschels, how matters really stood in the universe, that they felt extremely abashed and disheartened about it. Let us for a moment imagine them in their state of original ignorance, fully persuaded that Astræa was the Mundus or world, and that all the luminous bodies which, like us, they see in the sky, were merely a drapery hung up for the regalement of their eyesight. What a mighty thing Astræa is, and what a grand set of beings are the Astræans! A sun to give us warmth and vegetation. Stars to begem our nightly view. Sister Pallas, or Vesta, occasionally sailing pretty close by, about the size of a moon, as if by way of a holiday spectacle. Everything very nice and complete about us. But lo! astronomy begins to tell strange tales. It now appears that there are co-ordinate bodies called planets, probably inhabited as well as ours, and of infinitely larger size. The stars, moreover, are suns, having other planets in attendance upon them, and these probably residences for human beings too. All at once, Astræa shrinks from its position as the centre and principal mass of the universe, into the predicament of a paltry atom, hung loosely on to a machine whose centre is far otherwise. And the Astræans—the People of the World—the Metropolitans of Space—are degraded in a moment into a set of villagers. What a fall is there, my countrymen, for a respectable set of worlders, who happened not to possess sufficient self-esteem to bear them up against it! What an overturn to all the ordinary ideas of Astræan mankind! One can imagine the fact making its way over such a baby globe in the course of a couple of days, and thus producing a universal hanging down of heads and thrusting of tails between legs, as it were simultaneously. What a sad state for a world to be in—not a bit of spirit or spunk remaining in it; not one Astræan fit to say a cheering word to another! In such a state of things, one can imagine hardly a word of any kind spoken in Astræa for a week. It would look as if the planet were never to get up its head again in life. There would, however, be varieties in the moods of Astræans on this distressing subject. Some, a little more vapouring than the rest, would by and by suggest that no matter for the small size of the globe; the smaller the globe, the bigger the people, for, gravitation being less with us than in larger worlds, we require larger size to keep us fast to the ground. Let neighbour Jupiter, then, plume himself on his vast diameter, but his people must be pigmies in comparison with us. The malicious, again, would feel a consolation in the idea, that there was at least one planet no larger than Astræa. It is always a great matter to have associates in any misfortune or degradation that befalls us. Come along, then, friend Pallas, you and we against any of these lumbering worlds. Huzza for the tight, light, nice, trim, little planets! In time, the first feelings of humiliation would wear off, and perhaps the Astræans would at last come to look upon their world as not so bad after all. Well, if we are only a kind of village in the solar system, why, let us just make the best of it, and endeavour to be content.

Another view occurs respecting Astræa, that, if it have advanced in the arts conducive to locomotion, and spins at anything like an average rate of speed upon its axis, it may be quite possible to go round it in a single day, and thus enjoy either perpetual noon, or perpetual midnight, or perpetual dawn or sunset, as taste may dictate. And not only this, but if there should be any violent discrepancy of seasons in the little globe, it will only be like going down into Hampshire to move from the winter to the summer hemisphere, and thus realise all the advantages which the migratory birds possess in our sphere. One can imagine an Astræan of the upper classes having one house in the north temperate zone, and another in the south, and dividing his year of fifty months between them, so as to dispense with coal-fires and paletots continually. The poet will not therefore need to say to the cuckoo, Oh, could I fly, I'd fly with thee—we'd make with joyful wing, our annual visit round the globe, companions of the spring; for at the proper season he will find railways advertising cheap trains to accomplish the same purpose. The convenience of all this must be very great, and for those having money and leisure, existence in Astræa will, we take it, be rather pleasant. Even in the power of saying—Taking a trip round the world the other day, I met with a strange adventure about the hundred and eightieth degree of longitude, &c. there will be a happy piquancy. What snobs they will be who have not been at least once round the world in Astræa!

Spin on, then, trig little ultra-zodiacal—last, but perhaps not quite least, addition to the solar family. We of the Earth, Astræa, are glad to make your acquaintance, and see you amongst us. We cannot, in sober truth, flatter you with the idea that we consider you altogether on an equality with us, for, overlooking your diminutive proportions, there are strong suspicions of your being only a bit of a planet, a shred of some respectable mass that blew to pieces one day. However, we are very glad to think that you and your sister fragments have all got round again, and found yourselves able to go on as before in the business of perihelian revolution. If we cannot preach in the kirk, you know, we may sing mass in the quier: better a wee buss, say we in Scotland, than nae bield. And you, Astræans, we would recommend you, if you be at all in comfortable circumstances, not to be jealous or invidious of the people of the larger planets; for, if we on earth be any fair specimen of them, we can assure you there is nothing in the solar system for you to be envious about. Things are but in a so-so state amongst earthly mankind—three-fourths of them mere barbarians; and even amongst the civilised nations, a vast proportion know life but as a scene of toil and misery! To let you into a little secret, man is a selfish being, who frustrates his happiness by his very eagerness for his own benefit. There has therefore never been such a thing as real happiness known upon Tellus, grand as it may appear to you, even without the aid of a telescope. We only hope that matters will, by and by, be more agreeable, and that our remote descendants will have less occasion for grumbling. Tom Thumb of worlds, who can tell but you know all this, and, contented with your own small field of existence, look down with pity on us wretched earthlings! Well for you to be in such a frame of mind. But in that case,

we wrap ourselves up in our pride, and, sternly hushing our misery in our bosoms, bid you go by, and think not of us. While we have strength to bear, who can have any right to visit us with compassion?

A RUN THROUGH EGYPT IN 1842.

EVERYTHING appertaining to a country so intimately associated with the history and progress of mankind as Egypt, must be ever fresh and attractive. The learned find no termination to their research; the ordinary reader no limit to his curiosity and wonder. It is for this reason that we turn to notes of a journey from Alexandria to Cairo, the Pyramids, and the Red Sea, performed in the summer of 1842, by the Rev. G. Fisk, then on his way to Jerusalem and other principal localities of the Holy Land.*

The reverend gentleman's outward route lay through France and Italy; from Naples he steamed to Alexandria, in company with 'a motley group of English, French, Italians, and Greeks, a considerable allowance of priests, a Franciscan monk, and four sisters of charity.' After a somewhat trying passage, the steamer dropped anchor in the bay of Alexandria on the 25th of April; boats in great numbers were quickly around her; and our traveller and party taking possession of one, cleared off with all possible celerity. 'We had then a distance of nearly two miles ere we could get on shore; and when we fairly came to land, what a picture was presented! The oriental appearance of the city and of its population spoke for itself at once; and we felt that an African climate was about us. Throngs of half-naked Arabs, clamorous for employment as porters, stood around. The harsh guttural of the Arabic tongue sounded strangely in our ears. Asses, some saddled for riding, and others prepared to carry baggage, together with guides and servants proffering their services, all pressed upon us together, as we first set our feet on the shores of Egypt; while, somewhat in the background, a long string of camels, laden with timber, stones for building, and water-skins, passed along, with their slow, dreamy, yet majestic step; and here and there the "feathery palm-trees" waved gracefully in the slightly moving breeze which swept over them from the desert. It would have amused our friends in England could they but have seen us on our arrival, with our baggage laid upon asses, guided by attendant Arab men and boys—a troop of them, all jealous of each other on account of the few piastres which were to be the price of the accommodation; the selected ones exulting, the rejected ones growling and fuming—and all going in uproarious procession through the narrow and squalid-looking streets and avenues of the Arab quarter, amidst crowds of the most picturesque figures that can be conceived — some gravely and silently smoking their long pipes—some squatting on the dust in the shade of the low mud-walled dwellings, in earnest conversation —some playing at games, and others carrying on their heads and crying various articles of small merchandise. Women were seen bearing their half-naked babes astride on their shoulders, and others riding on donkeys, which are the "hackney coaches" of Alexandria. Winding our way slowly through the overhung and confined streets, with a sense of entire novelty and strangeness, we reached at length the European Hotel, rejoicing at finding ourselves once more in a condition to enjoy rest and repose.'

While in Alexandria, the party saw much to interest them—nothing more so than the bustle and heterogeneousness of the bazaars. These 'present every article of convenience suitable to oriental notions; and indeed at Alexandria, most European wants may be well enough supplied. Bazaars for the sale of tobacco of various kinds, and in various forms for consumption, are found in all directions; and the smell of tobacco-smoke is the most familiar odour of the place. Everybody smokes, and at every hour of the day. The whole front of the bazaars is open, and has a floor raised about two or three feet above the level of the street. It is furnished with carpets, and sometimes with cushions in the form of a dewan; and on these the purchaser is not unfrequently seated, while selecting the articles he wants, and agreeing—or rather disagreeing and haggling about the price; for every one who purchases at a Turkish or Arab bazaar must make up his mind to this, unless he would pay double the value of all he needs. The Arab traders are a stirring, active people—on the look out for customers, and prompt in attending to them. It is the reverse with the Turks. They will suffer you to stand and look about, and handle the various goods within reach, without rising from their usually recumbent posture, or putting their long pipes from their mouths. When you go so far as to express any particular want, they will slowly and almost unwillingly break in upon the half repose which they are enjoying, and place before you the required articles, apparently careless whether you purchase or not.'

According to Mr Fisk, a spirit of improvement manifests itself in the external aspect of Alexandria: from the bay to the citadel, and thence throughout the public works, there are proofs of growing importance, to be attributed solely to the enterprise of the present pasha. The great admixture of Europeans with the native population deprives the city of much of its oriental peculiarity; and in this respect it reminds the traveller of Malta or some other semi-Anglicised city. Though living under a purely despotic government, the people appear cheerful and happy; 'and certainly,' continues our author, 'I have never seen in Egypt such instances of squalid misery and mendicity as I met with in Italy wherever I went.'

Leaving Alexandria on the 29th of April, the party proceeded to Cairo by drag-boat along the Mahmoudi canal as far as Atfeh, and thence up the Nile. Their passage—in these days of railways and steam-tugs, and much talk about Red Sea and Mediterranean connexion —appears to have been a very rude and primitive affair. 'All our progress along the canal was effected by towing—for which purpose sometimes four, and at others six horses were employed, and changed about every twelve miles. The horses were ridden by wild half-naked Arabs, and sometimes Nubians, whose feats of horsemanship on the banks of the canal were perfectly novel and amusing. When dashing along at a rapid rate, they set up a wild shout, which breaks at length into a choral song, anything but harmonious to European ears. In some parts of the canal the water is exceedingly scanty, and, on other accounts also, impracticable for the ordinary plan of towing with horses on the banks. This inconvenience is constantly met by the riders springing from their horses, dashing at once into the water, tackling themselves with ropes, and swimming sometimes, and at other times rushing over the shoals of sand, and dragging the boat along with surprising force and agility. In this picturesque operation they are joined by the crew; while the unyoked horses are led on to resume their labour as soon as the state of the river will admit. This curious scene we repeatedly witnessed in our passage along the canal and up the Nile.'

When about half way to Atfeh, news was brought that Mehemet Ali was descending by the same route to his maritime capital; and so every one on board was on the *qui vive* to get a glimpse of the great man—the regenerator of Egypt. This fortunate juncture was not, however, without some little mishaps to detract from its pleasure; for the pasha pressed the boat and men into his service, and left our travellers to shift as they best could—an incident highly characteristic of the man and of a despotic country. However, 'we had a full view of Mehemet Ali as he sat at dinner, and while he was enjoying his chibouk, attended by his

* A Pastor's Memorial of Egypt, the Red Sea, the Wildernesses of Sin and Paran, Mount Sinai, Jerusalem, and other Principal Localities of the Holy Land. London: Seeley and Co. 1845.

retinue; and afterwards, when he came from the farm-house on the river's bank where he was resting, and mounted his white mule, for the purpose of taking possession of our boat, we were enabled to form a tolerably accurate notion of his person. He is a most remarkable man, and realised all we had heard about him. He is now past seventy, with a hale, firm, and determined countenance, and venerable white beard. Seeing two Europeans near him, as he hastily passed by, he glanced a very peculiar but not unfriendly glance upon us; acknowledged slightly our bows, made some passing observations to his nearest attendants, with an evident reference to us, and in another minute was mounted on his mule. His highness's pipe-bearer and coffee-bearer, his silver washhand basin and towel-bearer, secretary, and interpreter, all were in immediate attendance upon him. The scene was very interesting and very oriental. Here was perhaps almost the wonder of the age—the soldier of fortune, who had risen from the humblest rank in the Turkish army—now the powerful despot of Egypt, with almost patriarchal simplicity taking his homely mid-day meal at a small farm-house, and departing, as ancient despots used, surrounded by slaves, camels, dromedaries, &c. &c.' Mr Fisk declares he will not easily lose the impression made on his mind by this glance at Egypt's pasha; every Englishman who has seen him declares the same. Cromwell, Napoleon, Bernadotte, and others who have stepped from obscurity to thrones, are scarcely his counterparts. There are specialities in his case that leave him alone; and though one cannot offer a justification of some of the means whereby he works out his policy, yet it must be allowed that much has been done well.

Having arrived at Cairo, the first thing that arrests attention is the apparent redundancy of the population. 'It is estimated at about two hundred and twenty thousand, including Copts, Jews, Turks, and Egyptian Moslems. The streets of the city are for the most part exceedingly narrow, particularly those which are occupied by bazaars; where the mingled odour of fruits, tobacco, and various other articles of merchandise is anything but grateful. It requires great tact and heedfulness to make way in the streets, especially if on foot. The very easiest thing imaginable is to get one's toes crushed by the foot of a barb, or to be scampered over by donkeys in full canter, urged on by their shouting drivers; or quietly walked down by a camel, with his dreamy step and his nose in the air. Everybody seems to be in everybody's way; and yet all escape wonderfully. In Cairo, as in all other oriental towns, multitudes of wolf-like dogs lie about the streets—not only in safe corners, but in the most frequented ways; and it is a matter of the greatest difficulty to arouse them from their half repose. At night their howling and barking is quite distressing, and effectually banishes sleep from all who have the least tendency to be wakeful.'

The appearance of the town, however, is on the whole one of comfort. 'It has the air of a primitive place, both in regard to its architecture and its inhabitants. The upper storeys of the houses project so much that the occupiers might almost step from one to the other. But then this helps to keep the streets cool by shutting out the intense heat of the vertical sun. Though crowded by an incessantly moving population, the streets seldom have the feel of suffocating heat. The windows of the houses have, for the most part, no glass, but consist of wooden lattice-work, often richly carved and ornamented, projecting somewhat like small oriel windows in Gothic architecture. This, too, gives a complete idea of coolness and comfort. The houses themselves are chiefly Saracenic, built of very solid masonry, in large massive blocks of stone; and often the doors, or main entrances, are much enriched with carved work. The principal houses are quadrangular; and a spacious court, open at the top, affords communication to every part of the habitation.'

Among the novelties of Cairo visited by our traveller, were the gardens of Ibrahim Pasha, the son and successor of Mehemet Ali. These occupy a considerable part of Rhoda Island; and at the time of Mr Fisk's visit were all life and animation, in consequence of some festal season, during which they are regularly thrown open to the public. 'A vast assemblage of people of all classes were thronging about—some in parties seated in circles under the shade of spreading trees, laughing, jesting—smoking; while others were pacing along in slow and stately march, from avenue to avenue, in all the glitter and colour of orientalism. The greatest decorum prevailed; and it was pleasant to see that neither leaf nor flower suffered violence at the hands of the numerous visitors. The gardens are very extensive, and are laid out partly in European and partly in oriental taste; and irrigation is carefully provided for by the digging of small canals or trenches, which are kept well supplied with water. The trees, of various kinds—some native and others foreign—appeared to thrive remarkably well. The pomegranates were full of their richly-tinted blossoms. The roses, among which there was but little variety, were mostly fading away, having already enjoyed their blossoming time. The climate was delightful, and added much to the charm of a scene so novel and picturesque.' On another occasion the party visited the palace and gardens of Mehemet at Shubra. 'These are beautiful of their kind, and more trim and formal than those of Ibrahim Pasha at Rhoda. Straight lines prevail very much, and the paths are in many places paved with variegated pebbles. Lemon, apricot, and other trees abounded, bearing fruit abundantly; while roses, jessamine, and various beautiful flowers, lent their aid to complete the effect. We could not obtain admission to the whole of the palace, but had the honour of seating ourselves on the pasha's dewan, in one of his chambers of audience. The palace gives but little idea of oriental splendour; and so far as we saw of it, was fitted up in the poorest style of tawdry French decoration.'

After visiting the slave bazaar, that moral plague-spot in all Mahommedan cities; enjoying the luxury of an oriental bath, with all its delicious appliances; and surveying the vastitude and grandeur of the Pyramids, our travellers made preparation for their journey through the desert to Sinai, Edom, and Palestine. For this purpose an escort of trusty Bedouin Arabs was engaged, and the other preparations made with all possible alacrity. Mr Fisk devotes a special page to those preliminaries, on the ground that former travellers have been but scanty in their information on such matters, and in the belief that what he mentions will be useful to others who may be meditating such a tour. 'Our provisions,' says he, 'consisted of casks of biscuit, rice, maccaroni, vermicelli, pasta, dried fruits, coffee, and tobacco for the Arabs in abundance; a canteen with plates, dishes, knives, forks, spoons, and cooking vessels; a coffee pot, charcoal for cooking, block-tin basins for washing, a large supply of well-seasoned skins for water (new ones being objectionable on account of the rancid taste they are apt to impart to the water), Arab umbrellas, rudely made of green and white cotton stuff, to protect the face against the sun; porous water-bottles made of baked earth, to be slung at the saddle, which, by evaporation, keep the water comparatively cool for immediate use; a firm well-constructed tent for ourselves, and another for our servants, with camp stools and a table made to fold up with the tent; segaddehs or prayer-carpets used by the Musselmans—to form part of our beds by night and saddles by day; mattresses and light coverlids, and nicely-constructed framework, made of split branches of the palm-tree, to protect our bedding from damp and vermin; Arab lamps, to be suspended in the tents at night, and a good store of wax candles and oil; pistols, sabres, ammunition, and Arab attire, which our friends in Alexandria and Cairo advised us to assume. The costume which I wore was that of a Khowaga, or merchant of Cairo, consisting of white linen trousers of very spacious dimensions, yellow mo

rocco slippers next my feet, and scarlet ones over them; a cassock of rich crimson and yellow Damascus stuff, bound round the waist with a long silk scarf of variegated colours, and over it a flowing robe of olive-coloured cloth; a white turban and tarbouch, or crimson-felt skull-cap, with a close linen cap within it—affording the most comfortable dress for the head (which was shaved according to the oriental custom), and protecting very effectually against the intense heat of the sun.'

In this style, and with such a cavalcade, our traveller left Cairo on the 10th of May, and on the evening of the fourth day after, reached the miserable little port of Suez. Of this meeting-point to many routes, Mr Fisk speaks in the following terms:—'On passing the gates, you enter an irregular kind of square; on the left you catch a view of the sea, with a small dockyard, in which small craft are built; on the right are a few poor and squalid-looking buildings and a khan. Beyond the square is a long principal street, leading to the governor's residence; and to the right are the bazaars, in which are assembled all varieties of the oriental family—meeting as in a point, from which diverge many of the Asiatic and African routes. From Suez guides and escorts are easily obtainable to facilitate journeys in all directions. With the exception of the residences of the governor and a few principal inhabitants, the houses are mean habitations, and chiefly built of bricks formed of mud, and baked or dried in the sun. While passing along among some of these, to mark the domestic habits of the people, I saw a small school with about a dozen or fourteen children, who were studying with all their might, and with no small sound, the Arabic alphabet, written on large boards, set up before them, or held in the hand; while the tutor, squatting on the floor, and enveloped in clouds of tobacco-smoke, looked on in silent satisfaction.' Our author looks hopefully, however, towards the future. 'The overland route to India will, if perpetuated, effect great changes in the general character of Suez. The free and frequent admixture of Europeans with orientals cannot long continue without resulting in local modifications. The oriental character and habit will doubtless stand long against serious innovation of any kind; but a new spirit of enterprise will, in all probability, be traced by and by in the minds of those with whom Suez is a place of permanent residence. Already there are indications of progressive change; European habits and customs are becoming prevalent; and European establishments are springing up in the various forms of mercantile speculativeness.'

After one night in Suez the party passed over to the Asiatic side—their future journeyings being amid the scenes of biblical history and prophecy.

'MY ESCAPE FROM VIGO PRISON.'

BY THE ENGLISH CARLIST.

During the perilous services in Spain and Portugal of the individual whose vigilance deceived the French police,* he met with many adventures, which, if collected, would make perhaps one of the most singular records of modern times. Don Gulielmo, as he was familiarly called while in these dangerous services, is not a man, however, at all desirous of notoriety, and it is only when his friends get him in a talkative humour, that one of his many reminiscences comes to light. We generally are the depository of his secrets of this nature, though it can scarcely be said we keep them over-faithfully; the only restriction our adventurer lays us under being, that we mention no names. To this we agree, as far as necessary, and then we receive full permission to make what use we think proper of the facts. A few weeks ago, we breakfasted with the English Carlist, when, always anxious to collect information, we pressed him to tell us another of his adventures. Our good-natured friend assented, and, filling himself an ample cup of coffee, narrated nearly as follows this tale of his imprisonment at Vigo:—

'It is of little consequence how, but during the war it happened that I had charge of a schooner, with instructions to run her into the first private bay in the neighbourhood of Vigo with which I might fall in. I was by no means to enter any harbour, where it was probable other vessels might be found; and, moreover, was desired to take the night-time to effect my landing. These precautions would scarcely have been necessary had my cargo been broad cloth, or any other article of English manufacture connected with the exterior or interior wants of man. When, however, I state that my schooner contained sundry boxes of silver money, and a goodly supply of arms and ammunition, and that these were not the property of the recognised and constituted authorities, it will readily be understood why I sought darkness and privacy. The task was the most difficult I was ever appointed to, and, save the siege of Oporto, in which you know I figured, caused me much suffering. After running off and on for several days, I at length determined to make for a little nameless bay which I had been for some time looking out for, and there disburden myself of my dangerous charge. I had selected a foggy and murky day for this enterprise, as I feared the vigilance of the *garda-costas*; and, under cover of this veil, approached the land about three in the afternoon. We were sailing on a wind with our larboard tacks on board, a sharp look out being kept for the first glimpse of land, when a sailor in the square-sail yard cried, "Sail, ho!" "Where away?" cried I eagerly. "On the weather bow." I seized hold of the main rigging, and swung myself on the lee bulwarks, and there to windward, not four hundred yards distant, was a brig bearing down upon us under a crowd of sail. A gun at this moment was fired as a signal for us to heave to; an order I felt compelled to obey, though with a heavy heart. The necessary orders were given, and before long, the two vessels were lying side by side on the water, while a boat filled with armed men put off from the brig to us. They boarded us, and as a very slight examination satisfied them as to the schooner's character, we were all declared prisoners, and I being unfortunately the individual in command, was transferred to the brig, which, having accomplished the duty for which it was sent out, at once returned to Vigo.

'The brig came to an anchor in the night, which was pitchy dark; but, without any ceremony, I and my crew were at once taken ashore, and, under a heavy guard, hurried through the streets. The gloom was too great for me to distinguish anything, and we were, moreover, so closely surrounded by armed ragamuffins, that nothing but the tops of the houses could be made out. At length we halted in a large square, before a gloomy pile that rose darkly against the sky; a bell was rung, a few words were exchanged with a gruff voice within, and then a door opened. I started back as the light of a torch fell full upon my face, but instantly recovering, followed my conductors with a firm step. Leading the way through a long dark passage, the jailer thrust me and my comrade, Baron M——, a Frenchman associated in the undertaking, into a cell which was already tenanted, as we could see by the dim light of the torch. For some minutes after we were left alone; neither spoke; and then the Frenchman began to deplore his fate, and curse the day when he associated himself with a cause that bore such disagreeable results. I replied; and our conversation was carried on some time without interruption. "Well, cavaliers," at length exclaimed our companion in durance, "you have talked long enough in a jargon I don't understand. Do you speak mine?" I intimated that I did, and he then

* See Journal, new series, No. 96,—'Adventure of an English Carlist.'

asked if we had any objection to a light. Though wondering much at the question, neither of us hesitated to acquiesce, and we were very soon cheered by the presence of an oil lamp, which the stranger lit by means of a pocket flint and steel. As soon as the light fell full upon my face and on that of my new acquaintance, we mutually started. "Don Gulielmo," said he; "Juan Castro," exclaimed I. It was Juan Castro, the noted smuggler or *contrabandista*, but better known as the most efficient spy in our service. Surprised at this meeting, explanations followed, which soon proved that both had been equally unfortunate, and on the same occasion. He had been looking out for the schooner ashore, with his band, while I was engaged in endeavouring to run her into harbour. The treachery which must have betrayed me, had doubtless served him the same good turn. "I know my fate," said he gaily; "a priest and a file of soldiers in the market-place." "You seem to treat it lightly," observed I, who had little reason to expect much better myself. "Because," he added more gravely, "I do not mean them to have their will. I mean to escape, and you, sirs, may escape with me if you will, as in these times it may stand but ill with yourselves." I looked round my dungeon doubtingly ere I replied. It was a solid stone fabric, with a large iron grating opening on the corridor, promising but few facilities for an evasion. My looks expressed as much. "I see, signor, you doubt my ability to get out of the clutches of the enemy; but trust me, and all shall be well. I am not without friends in Vigo, and my daughter Maria has such winning ways with her, they never search her basket. She will be here at dawn and at sun-set; and if we don't escape to-morrow night, my name is not Juan, that's all." Exhilarated by this prospect, I explained all to the baron, who brightened up, and, with the peculiar light-heartedness of his countrymen, accepted the contrabandista's proffered wine and other refreshments, and did justice to them too. As for me, I am a cosmopolite, and in all countries adapt myself to the people. In Rome I do as Rome does, and in Peru I am a Peruvian. We feasted accordingly, and then lay down upon our straw to seek rest and refreshment.

'I woke only as a merry and rich voice was heard carolling a patriotic stave at the other end of the long passage. "My daughter," said Castro with a tone of pride. "It is not every contrabandista can boast such a one as Maria." I agreed with him in this particular, and rising, advanced with the hardy smuggler to welcome the girl. She was one of the usual dark-eyed beauties of her native country, in the picturesque costume of a peasant girl, while on her arm was a basket covered with a cloth, which the jailer, who followed her, eyed with somewhat of a suspicious air. "Well, father," said Maria gaily, "I wish you would teach your keepers manners. Here is a great fellow wants to pull your breakfast about, as if it were not hot and nice, and none the better for being exposed to the air." "Nonsense! Josè is only joking with you," replied the smuggler, with a self-possession which excited our admiration to no small degree; "but I am hungry, so hand hither the basket, and take this empty one. And harkee, girl; this evening bring *two more of the same*, for I have a couple of friends here, good Carlists as any, and I would fain regale them ere I take my long journey." Josè turned his back with a half-satisfied grunt, suffering his eye to rest admiringly on the girl's face for a moment. Maria's really beautiful countenance determined him, especially as she gave him an exquisite smile. Juan in a hurried whisper explained his meaning, and, to prevent suspicion, Maria departed immediately. "Thank Heaven!" muttered the smuggler, drawing a long and satisfied breath, "I am now safe." We asked an explanation, which was offered by his uncovering the basket, and exhibiting, under his food, a pair of pistols and ammunition. We now understood what "two more of the same" meant, and began to see a prospect of escape. *The pistols were hastily* concealed beneath the straw; and ere Josè returned with our scanty and coarse repast, the contrabandista was coolly enjoying his, in which the jailer joined him by invitation, drinking with much zest the excellent wine that Maria had provided for her father.

'When again left alone, we conversed in low tones, to pass the time; but in vain; the hours hung like lead upon our hands. None of us felt as yet certain of the result of our daring experiment until Maria should again visit us. Besides, we might be separated. I and the baron expected every moment to be dragged before a military tribunal, and to have a summary sentence pronounced on us, as had been the lot of Juan Castro. But we omitted at first to recollect that it was Sunday, and that our captors were doubtless too much engaged in enjoying themselves, and making much of their victory, even to think of us. Still, we felt an anxious beating of the heart, that no reflections could allay; while I prepared, at the worst, to assert my prerogative as an Englishman, and to claim fair trial by a civil tribunal. At length evening drew near, and with it the hour of Maria's return. She came. We listened with intense interest. She passed the outer gate, and again, accompanied by Josè, came up the passage. "That was famous good wine of yours this morning," said the jailer, "and I fancy I must try a little of it this evening." "Very good," responded the smuggler, taking the basket and handing it to me. "*Take out the bottles*, signor, and then we can treat our worthy jailer properly." While Juan detained the man by this manœuvre, I removed the pistols from the basket.

"What does that girl there, and what has she in that basket?" exclaimed a new voice, that of the head jailer. "It is the daughter of Juan Castro, and the basket contains wine and food which she bears to him. He is to die to-morrow, and I thought no harm in letting him have whatever he wanted." "Be off, girl, and let me see you here no more," cried the brutal jailer; "and you, Josè, just come inside and overhaul this basket, which contains, I warrant me, something besides wine." "Files perhaps," said Juan sneeringly; and then he added, in a whisper, "Be ready; our time has come, though sooner than I expected." The jailers entered, and started back: three brace of pistols, loaded and cocked, were at their heads. "Keep watch while I bind," said Juan; and tearing off some of his own and our clothing, he soon secured the astonished guardians, effectually stopping their mouths with straw and a gag. A sharp knife, glistening before their eyes, kept both quiet. "Now, my worthies," said Juan—who, having been more than once in a similar position, treated the danger very cavalierly—"I will thank you for that big key; and now, good-by. Josè, I leave you the eatables; the wine is too good to be spared. Now, gentlemen, if you please;" and in an instant we were hurrying along the prison passage. "Can we not free my men?" I muttered. "Certainly," said Juan, halting at another door, and applying one of the keys he had deprived the jailer of; "Vigo prison can spare them as well as us." He was mistaken, however: the cell was empty: and, as I afterwards found, they had all taken service with their captors, and at once obtained their freedom.

No more time was lost, and the hall was gained. It was deserted. Vigo prison was confided—so poor were the authorities—to the care of the two men we had succeeded in overpowering. It took but a few minutes to open the great gate, and we stood in the open air. We followed the smuggler, as the only man well acquainted with the localities. Hurrying down the left side of the square, Juan Castro entered the street of La Baca, at the end of which was a lane. Turning short before this, we halted at the door of a tavern. We entered without hesitation, and being evidently expected, a cheerful meal in the kitchen awaited us. Maria was there too, no longer the gay singing girl of the prison, but with intense anxiety painted in every lineament of her countenance. "And now, gentlemen," said the smuggler, seat-

ing himself, and motioning us to follow his example, "what are your intentions as soon as you have refreshed yourselves?" "To gain our camp in the hills," I replied; while the Frenchman seemed already disgusted with the cause. As, however, in Vigo his life was in extreme danger, there was little choice in the matter. I may as well, however, here remark, that it was the baron's first and last effort in the cause, and that at the first convenient opportunity he returned to France, and foreswore all foreign campaigns for the future. I believe you think that perhaps I had been more wise had I done the same. Perhaps so; but to my story.

'In half an hour we were mounted on mules; and having once succeeded in leaving Vigo, it will readily be believed we did not allow the grass to grow beneath our feet. About midnight we reached a road-side inn, where we halted, and where, to our surprise and vexation, we found half a dozen soldiers of the other party. Presenting, however, a determined air, we were not molested, even Maria being allowed to seat herself unnoticed. We made no stay, however, and after a short half hour of repose, were again on our way. The next morning brought us to a halting-place in safety, and then, and only then, did we enjoy repose and sleep. Next day I made a report to the king, and failed not, as times went, to reward the services of the contrabandista and his daughter. Such is the history of my acquaintance with the prison of Vigo, the only one I hope it may be my lot to make.'

I thanked my adventurous friend, who, changing the subject, told me of other passages in his life equally curious, and which may perhaps one day find their way into these pages.

SAMPSON ON HOMŒOPATHY.*

This is the most plausible treatise on Homœopathy which we have perused. The author, already known to the public by a work inculcating humane views of criminal jurisprudence, places the subject in a clear and interesting light, and writes with an earnestness worthy of a true and good cause. We take up the book, as affording us an opportunity of placing a companion portraiture of this new medical doctrine by the side of that which we lately gave of Hydropathy, or the Water Cure.† The readers will of course bear in mind that what they read is the pleading of an advocate, though, we thoroughly believe, an honest and disinterested one.

The first chapter is devoted to a view of the ordinary system of medicine, respecting which it quotes the language of practitioners of high character, admitting it to be a science which 'abounds in contradictory facts and loose speculations.' Condensed extracts are given from Dr Craigie's *Elements of the Practice of Physic*, which, if truly presented, would seem to show all to be uncertainty in ordinary practice in the diseases ague, fevers of various kinds, erysipelas, leprosy, ringworm, smallpox, ulcerous sore throat, croup, catarrh, gastric inflammation, dysentery, delirium tremens, hydrocephalus, paralysis, quinsy, asthma, epilepsy, and many others. Thus it appears, thinks our author, that the success of the present system is not such as to warrant us in refusing an examination of one resting on different principles. He further presents quotations of a similar kind, taking away almost all faith in blood-letting and mercury, which have usually been regarded as the most unchallengeable of all remedial agents. From the evidence adduced, he considers himself entitled to infer, 'that, from a resort to medical aid, one of the three following circumstances will in a majority of cases take place:—namely, a complete or partial cure, with the drawback of some after-suffering from the remedies employed; a failure of the remedies, so as to leave the disease untouched, with the addition, at the same time, of evil consequences from the natural action of those remedies; or, finally, such a disturbance of the system and weakening of the vital power as shall rapidly accelerate a fatal termination. Under the most favourable conditions, therefore, we have no promise of deriving a simple and unquestionable benefit. In the best case we can look but for an exchange of ills, however much in some instances that exchange may be in our favour; while under the two last suppositions, the prospect is one of little else than unmitigated injury.'

After insisting a little more upon the unsatisfactory results of the present system, shown so distressingly in the vast amount of premature mortality, Mr Sampson presses the demand for a new and more certain method upon the public at large. He speaks of 'that large class of superficial persons who, while they feel themselves both unwilling and incompetent to examine evidence on scientific points, are nevertheless apt, for the sake of popularity, to echo, as if from their own deliberate opinion, the prejudices of others, and thus to indispose persons over whom they possess influence—for the very weak find some still weaker to look up to them—from paying attention to the subject. The temptation of keeping on the safe side, by refusing to recognise, or even to examine, a new doctrine until the majority have come over to it, is irresistible to those who do not feel sufficient power to stand alone; and in yielding to the impulse, they incur no other charge than that of weakness. But when such persons cease to confine themselves to a mere reserve of judgment, and flippantly repeat as original, or quote with approbation, the contemptuous remarks of a third party, it would be well, on all occasions, that they should be visited with reproof. If they feel themselves competent to examine the evidence in relation to it, it is their duty to do so, and not to give an opinion until the task be completed; and if they do not feel thus competent, they certainly cannot be fit to judge of the competency of those whose sentiments they echo, since it is much easier to decide upon a plain statement of facts, than upon the existence of those intellectual and moral qualities which must be possessed by another, to justify us in adopting his judgment as our own.'

Homœopathy comes forward as a medical method founded on one law affecting our bodily constitution. It considers the symptoms of a disease, not as a part of the disease itself, but as the effects of an effort of nature to throw off or rid herself of the disease. It is held, accordingly, to be the first object of a physician to favour and aid nature in this effort. For this purpose, his applications ought to be of a kind which have been found to produce diseases analogous to that under which the patient labours. What first suggested the idea to Hahnemann, the founder of homœopathy, was an experiment he tried with Peruvian bark, which he found to produce all the symptoms of the disorder for which it had been celebrated as a remedy; namely, intermittent fever. 'From the results of patient experiments, undertaken by himself and some devoted friends, and carefully conducted through a long series of years, the peculiarity which had been discovered to attach to the operation of quinine, of producing symptoms analogous to those of the disease for which it is a remedy, was found to attach also (as far as these experiments went) to every other medicine; and thus a mass of evidence was collected, sufficient, in the absence of opposing facts, to lead to a conviction that the property thus observed is a universal characteristic of remedial agents.' The details of these experiments are open to examination in the books where they are published. They form, Mr Sampson says, a ground for the belief in a homœopathic law; but the system has also practical results in its favour. 'Statistical reports duly verified, showing the comparative results of the homœopathic and allopathic treatment, are now to be had from many of the chief cities of Europe and America, embracing a suffi-

* Homœopathy; its Principle, Theory, and Practice. By M. B. Sampson. London: Samuel Highley. 1846.

† See article, 'Six Months at Graefenberg,' in No. 105, published January 3, 1846.

cient number of cases to enable all those whose minds are open to evidence of any sort, to arrive at a definite judgment upon their respective claims. Of these statistics, the most important perhaps are those which refer to the treatment of cholera, the results thus obtained having produced the first strong popular impression in Europe of the efficiency of homœopathy. The high rate of mortality in the cases of epidemic cholera which occurred in Europe in 1831, is well known. "As respects this country," writes Dr Elliotson, "I cannot but think that if all the patients had been left alone, the mortality would have been much the same as it has been; for we are not in the least more informed as to the proper remedies, than we were when the first case of cholera occurred. Some say they have cured the disease by bleeding; others by calomel; others by opium; and others, again, say that opium does harm. No doubt many poor creatures died uncomfortably, who would have died tranquilly if nothing had been done to them." While Dr Joseph Brown, by whom the course of the disease was observed at Sunderland, from its commencement in October to its cessation in January, states the mortality to have been 202 out of 534 attacked, or 38 per cent., and he speaks of a mortality of only 22¾ per cent. in the epidemic which prevailed in the Presidency of Madras from 1818 to 1822, as "a proud monument to the skill of the medical men employed, and to medical science in general." Now, the results of the homœopathic treatment of this disease in Europe in 1831, show a total of 2753 cured out of 3017 persons attacked, being a mortality of only 8½ per cent., and must be held, therefore, if the eulogium of Dr Brown on the practitioners of Madras is in anyway deserved, as a "proud monument" of the skill of the homœopathic practitioners, and to the "science in general," by which their practice had been guided.'

So far, homœopathy presents nothing that the public, if not the profession, could have opposed otherwise than on practical grounds; but then—the small doses! Homœopathic doctors administer their medicines in quantity extremely minute, triturating the solid, and diluting the liquid, till, in some instances, the decillionth part of a grain or of a drop is attained. In defence of this practice Mr Sampson appeals to experience. Hahnemann found 'that there was a much greater susceptibility of the system to medicines administered in accordance with the symptoms, than in opposition to them, or in disregard of them, and that it would consequently be necessary to lower the dose to an amount which, while it would eventually be followed by a perceptible improvement in the condition of the patient, would produce, in its first action, no distressing or dangerous results.' The smallness of the doses is, the homœopathists say, a question apart from the fundamental law of homœopathy itself; but there is a separate *rationale* for it. 'A little reflection,' says Mr Sampson, 'will convince us that there must be some portions of our organisation, of the fineness of which the human mind would be inadequate to form the slightest conception. It will also appear that these structures are of far higher importance towards the maintenance of life than the coarser and more outward portions of the frame, and that disease becomes dangerous and severe in proportion to the extent to which they are affected. In the most deep-seated affections, therefore, it is to these tissues that the powers of medicine have to be directed; and when we know that medicinal substances, like all material bodies, are infinitely divisible; that we can never, by any process, reduce them to atoms so fine but that they might still be infinitely reduced, it seems at once obvious, that if we wish them to reach, and to act upon those parts to which I have alluded, and in relation to some of the delicate machinery of which the finest atom to be attained from our very highest attenuations would appear coarse and ponderable, we must endeavour to bring them not only into a finer state than that in which they are ordinarily used, but into a state of exiguity far beyond anything to which we have been accustomed in dealing with coarser structures. It is simply, in fact, proportioning the delicacy of our agents to the delicacy of the instruments upon which they are to operate.'

The homœopathists administer but one medicine at a time, on which Mr Sampson lays much stress. They attribute importance also to the trituration to which it has been subjected, and to its being received upon the tongue, instead of being swallowed into the stomach, the proper business of which is, they say, to receive alimentary substances, and which speaks loudly for their system by the loathing and rejection which are usually excited by doses of common medicine.

Finally, our author treats of the opposition which homœopathy has met with, and answers a number of the special objections made to it by medical writers. 'Dr Pereira says that the doses are so small, that "it is *difficult to believe* they can produce any effect on the system, and *therefore we may infer* that the supposed homœopathic cures are referrible to nature;" but it by no means follows that this inference will prove correct. There are many things which are difficult to believe, but which, nevertheless, we are compelled to admit; so that if it were really, as he alleges, difficult to believe that to operate successfully on an organisation of the delicacy of which it is impossible for the human mind to form the remotest estimate, we must employ agents so delicate as to be likewise beyond all our ordinary conceptions; the fact of this difficulty existing would have very little weight in the face of daily experience. It is "difficult" to believe that, by arranging the vibrations of sound in a particular manner, two loud sounds may be made to produce silence; and also that, owing to an analogous property of light, two strong lights may be made to produce darkness. It is "difficult" to believe that the most sensitive lady might plunge her uncovered hand into a caldron of boiling tar without receiving the slightest injury; while, if her hand were covered with a glove, it would be dreadfully burnt. It is "difficult" to believe that the white light from the sun is composed of all the primary colours; that the principal supporter of life and combustion is a gas which constitutes part of our atmosphere, and is not cognisable by our senses; that when iron filings are strewed on a board, and a magnet is held underneath, they are immediately attracted, and this to the same extent as if the interposing substance were not there; that owing to the attraction of a particular metal to oxygen, the extraordinary phenomenon may be presented of ice on fire—since potassium, when placed upon frozen water, will even abstract oxygen from it in that state; that if the temperature of water be increased beyond the boiling point, the insensible vapour will exert an expansive power sufficiently great to tear asunder the strongest vessels in which it may be confined; and finally, it is "difficult" to believe almost all things that are hourly presented to us, and, above all, the fact of our own existence. Still, we should hardly consider that "we might therefore infer" that we are wrong in connecting these events with the causes which experience has shown to be capable of producing them. If mankind had always adopted his view of suffering "difficulty" of belief to deter them from the task of accumulating facts, and from the duty of recognising those facts, it is quite certain that science would have slumbered from the creation of the world down to the present time.'

So far we have followed Mr Sampson without deeming it necessary to introduce any comment of our own. We would now remark that, while homœopathy presents much that demands the attention of liberal medical men, its professors ought also to make some allowance for the opposition of that class. The doctrine of the infinitesimal doses, argue upon it as you may, is so opposed to all our common ideas as to cause and effect, that scepticism is next to unavoidable; and it is not only natural, but highly justifiable, to surmise that the alleged results are attributable to an absence of medicine

altogether, rather than to the presence of agents so inconceivably minute. We are every day taking forty times the amount of their most active doses in our food, and that without perceiving any result beyond what is natural and normal. Admitting, on the other hand, the probability of the negative character of the homœopathic doses, what an important consideration does it become for the orthodox practitioners, that many cures arise, to all appearance, from both this system of treatment and from hydropathy, where medicine is abandoned even in name!

FIRESIDE CHIT-CHAT.

NO. III.

Gilaroo.—You have been reading, I see. Anything new?

Stukely.—Not exactly new. I have been perusing an early volume of Tytler's History of Scotland, one of the most interesting works I have read for some time—all the elegance of a romance with the solidity of a history. What fearful revelations the writer makes of the state of past manners—what monstrous usurpations—what crimes—what tyrannies of the strong over the weak!

Gil.—All history is much the same thing; little else than a record of crimes and miseries; injustice on the one hand, and suffering on the other. Ambition, however, has been the principal source of national calamity. A monarch, already powerful, wishes to become more so. He sees a comparatively helpless little kingdom in his neighbourhood, and thinking what a fine thing it would be to add it to his own already large territory, he does not scruple to put every species of base engine at work to accomplish his ends: if underhand means fail, he proclaims open war, lets loose a body of armed men on the unhappy country, with orders to put all to the sword who resist his iniquitous aggression. This was what Edward I. did with Scotland, a country he had no right to meddle with, and which fortunately was able to beat off him and his successors. This was what Henry II. did with Ireland, which was less fortunate in making its defence. This was what different sovereigns of the overgrown Russian dominions have done with Poland. It was by no other means that Prussia grew to be a great kingdom out of the small duchy of Brandenburg. France was once half a dozen little kingdoms, which were all swallowed up, the less by the greater, till it now forms only one. Spain has undergone the same process, Austria has encroached upon and absorbed Lombardy, one of the finest portions of Italy. What country, indeed, that can be named, has not become what it is by a violent aggression on the rights of others?

Stuke.—What, indeed; but it is one comfort that we do not see any of the injustice you allude to in our times.

Gil.—Pardon; not quite come to that yet. As long as there is ignorance, there will be also vulgar ambition, and its natural consequences. At present, if we choose to look abroad, we have many spectacles of already powerful and sufficiently large states attempting to extend themselves over comparatively defenceless territories. Nicholas of Russia is carrying on a war against the inhabitants of the Caucasus, of precisely the same nature as that which Edward I. carried on against Scotland, and with equal injustice. On what plea of right the French are attempting to conquer the north of Africa, is more, I imagine, than they could satisfactorily explain. The people of the United States, too, imitating the ambition of the Edwards, Henrys, Fredericks, and Nicholases of the old world, seem to have latterly become quite unscrupulous as to their acquisitions. After this, nobody need blame *kings* as the only aggressors on national rights.

Stuke.—Ah, I see; you allude to that Oregon affair? I cannot say I rightly understand it.

Gil.—Yes, it is that I was thinking of. Is it not a monstrous pity that the intelligent and peace-loving of two nations should for ever be kept on the brink of a mortal quarrel about such utterly contemptible points of dispute? Who in Great Britain cares a farthing for Oregon, and what rational American cares for it either? Yet, by heedless persons using indiscreet words, and manifesting a thirst of acquisition, the most alarming consequences may be threatened.

Stuke.—I have heard it said that a smart war, though expensive at the time, is not a bad thing in the main; it scatters money about, and gives a great deal of employment.

Gil.—I'll tell you what war does. It causes large sums—ten millions or so, for a beginning—to be raised by immediate or postponed taxation; if postponed, then interest as well as principal has to be provided for. This exaction operates detrimentally in two ways. Everybody gives money out, for which he gets nothing back, which is a loss; and the money, instead of being spent in creating articles of exchangeable value, is laid out on things altogether worthless. In making these articles—guns, for example—men no doubt receive wages, but the articles never sell for anything afterwards: you might just as well give men wages for doing nothing.

Stuke.—Stop a moment. Do not those who pay out money to buy guns—that is, the tax-payers—get back a considerable part of it in consequence of the briskness of trade? That, I believe, is the question.

Gil.—A few individuals in particular circumstances may get back more than they pay out. For example, a farmer who supplies food to a depôt of prisoners of war, may realise a profit ten times the amount of his taxes. But the people at large get back nothing. The money in the course of circulation may be paid to shopkeepers for articles, but these articles were not got for nothing. In the most favourable view of the case, the proportion of money returned must be infinitesimal—a thing too illusory to be spoken about.

Stuke.—But you will allow that vast numbers of men are employed as soldiers and sailors?

Gil.—Of course, and so much the worse. Assuming that the war is never to bring anything good to the country, the employment of so many men is a double loss—the loss of the money expended in feeding, clothing, and paying, perhaps pensioning them; and the loss incurred by the abstraction of so many able-bodied men from the field of labour.

Stuke.—I don't clearly see that. Are not the men busy fighting, which is surely labour?

Gil.—But it is a labour which yields no return. We get nothing out of it but misery. If fifty thousand men are kept blowing away gunpowder into the atmosphere for a whole year, we cannot, as far as I can see, be the richer for it, but a great deal the poorer. It is a labour worse than lost. As every one of the fighters might be working at some useful employment, and adding to the national resources, if he were not a soldier, it is pretty clear that war is an engine of national impoverishment. Of the calamities which it otherwise produces, I need say nothing. Its interruption of commerce, its distracting of people's minds from all sorts of social improvement, its positively barbarising influence, is all bad. The loss of life and limb arising from it is deplorable.

Stuke.—At all events, the army is recruited from the least useful and respectable portion of the community—a kind of riddance of badly-behaved young men. Is it not Laing who compliments us on our constructing the army out of the least valuable materials in the country, instead of, as in Prussia, using up indiscriminately the best members of the community as soldiers?

Gil.—There may be some truth in that, although I must say the army, on the whole, is an exceedingly well-conducted body of men, and abounds in persons of great respectability and intelligence. However, granting that it does rid us of many bad spirits, might not there be some better plan of rendering these men harmless to society, than in making them soldiers? Have all fair

means of instruction and melioration been tried? One defect in our institutions seems obvious: we have no general and humane plan for preventing petty crimes, and rescuing the youthful poor from vices which ruin their character, and send them a long life of misery. Public justice, in treating these unfortunate beings, never considers temptations, nor has any idea of predispositions in the individual. All are swept into the gulf: driven into the hands of the recruiting sergeant, or condemned and sent to the penal colonies.

Stuke.—I don't know that society is to be blamed for this. Some years ago, an association of benevolent persons, at their own expense, rid the streets of London of houseless and destitute children, to whom they kindly gave board, clothing, education, and industrial training. After thus putting them in a way of earning a livelihood, they apprenticed them to farmers at the Cape of Good Hope; for they could not get employment for them at home. Well, this institution was brought to an end, by what I thought a very senseless howl of the metropolitan press. They said it was a system of white slavery; and as the supporters of the institution had no interest in carrying it on, and did not like to be called names, they gave it up. I now see, by a report of what took place a short time ago in the Lord Mayor's court, that the streets are again haunted by destitute children, who of course all become thieves. I wonder who, in the face of the former experiment, will be willing to look after them.

Gil.—Why, the parish authorities certainly; and if they don't, schools of industry ought to be got up, at the public expense, to rescue these poor children from destruction. Something of this kind is already done in Aberdeen, with the best effect, and will be by and by in some other towns. Why should London not follow the example? My opinion is, that the society you allude to was far too easily intimidated. The members, knowing that what they were doing was from no bad motive, but the reverse, should have persevered—outlived the clamour against them.

Stuke.—So they would, I daresay, if they had been backed. The world is often most thankless to its benefactors, and often joins in the laugh against individuals who have for years been doing much good.

Gil.—Men of integrity of principle should not mind either sarcasm or abuse. You remember what Sir Walter Scott said of his enemies and detractors: 'I let them hum and buzz themselves to sleep.' Whatever arrangement is founded on truth and justice, must stand; whatever has a basis in fraud, must come to nought. Emerson puts this in the clearest light. It is an acknowledged truth in ethics, and not less true in social economics. Honesty, you know, is always the best policy.

Stuke.—Yet what is more observable than that of clever dishonest men succeeding in their schemes, while good men are defeated in their most useful arrangements?

Gil.—The dishonest and the shabby may achieve some paltry end no doubt; but look around, and see that if, on the whole, the honest men have not the best of it. Who are those who command respect?—I do not mean obsequious adulation—the honest men to be sure. Who are those who gain no esteem, though perhaps some applause, for their talents?—the unprincipled to be sure. If there be a lesson taught more distinctly than another at the present moment, it is, that no brilliancy of qualification, no power of genius, no learning, no rank, no anything, can make a dishonest man be respected. The plain inference is, that, in defiance of sneers and obloquy, every one should do his best to act with a resolute integrity of principle. It may be inconvenient, or it may involve some sacrifices in the meantime, but it will unquestionably be alone gainful in the end.

Stuke.—All very fine in theory, but only so-so in practice. We see countries making a capital thing of stealing other countries near them; we see great bodies of individuals living in splendid style, by stealing men and making them work like brutes; we see hundreds of persons as comfortable and respected as may be, although living by very shabby kinds of tricks.

Gil.—You look only at the outside of things. Among universal affairs, it is often difficult to trace the retributive punishment of acts unquestionably vicious, and indefensible on moral grounds. The ways of Providence are not always clear to the intelligence of man. Retribution may sometimes demonstrate itself in secret cankering cares, or feelings of remorse; sometimes in exposure to the world, and disgrace; sometimes in distressing annoyances from the failure of schemes; sometimes in terrible fears for consequences; at the very least, loss of self-respect. Who knows whether Russia may not yet repent of having crushed Poland? Is not Austria at its wit's end keeping Lombardy in subjection? Have not the French caught a Tartar in Algeria? May not the United States, by their extensions, be going on infatuatedly to their ruin? Is not their very slave system enough to blow them up? Honesty, along with kindness, I repeat, should be the governing principle of the world.

Stuke.—What you say may be true in the main, but I doubt its application to ordinary matters. It would be all very well, acting in every affair of life with transparent uprightness, and candour, and generosity, if every other person would do the same; but the bulk of the world are a set of sharks, with whom it is necessary, at the very least, to be always on the defensive. For my part, I have been the victim of all sorts of encroachments; and what is strange, I have been ill-used chiefly by those to whom I have shown kindness. I have got only kicks for my halfpence. Sometimes I cannot help laughing at the way I have been treated; it reminds me so much of the old story of the beggar and the merchant.

Gil.—What story do you allude to? I don't remember anything of the kind.

Stuke.—The story was this: I have seen it in some old book. In a certain city in the East there was a poor man, a beggar, who sat daily at the corner of a street, where his miserable appearance might excite the charity of the numerous passengers. One occasionally would give him a trifle; many gave him nothing. It happened that a rich merchant came to reside in that quarter, and taking compassion on the poor man, he dropped an alms to him daily in passing. The regularity of this bounty cheered the beggar very much. A coin equal to a penny was the amount of the alms each day, and on this he began to reckon with as much certainty as that the sun would rise. It became to him a sort of annuity. Well, this went on for a series of years, the beggar all the time improving in circumstances, and looking on his benefactor with profound respect. At length things took a turn with the merchant. Whether he had met with heavy losses, or had discovered some other pauper more needful and deserving, I do not know, but it is certain that he all at once desisted from giving the beggar his usual alms. The first day that this took place the beggar was a little surprised, but as it might be an accidental omission, it did not give him very deep concern. The second day he was surprised in earnest; he was dreadfully chagrined. What have I done, thought he, that I should merit this extraordinary treatment. The third day he was furious; it was an indignity not to be borne; it was a positive robbery. Addressing the merchant on the fourth day, he requested to know what he had done to be treated thus: why was his daily allowance stopped? The merchant was now in his turn surprised, and replied that he could not be questioned as to his dispensation of alms; he could do with his own as he liked. This answer, which you would think was quite reasonable, would not do for the beggar. He said that he had no wish to injure any man, but it was his duty to defend his rights, and seeing the merchant would not pay him his daily salary, he must refer the case to a court of justice. Accordingly, he had the merchant up before the cady, to whom he

explained his wrongs. 'This merchant,' said he, 'has done me a serious injury. He gave me a penny a-day for so many years that I arranged all my plans in reference to it. I married on the faith of the penny, and nothing else. I have a family to support and a rent to pay, and without the continuance of the penny, how am I to do either the one or the other? The stoppage of this revenue is, in short, a very great calamity, and I, in the name of the prophet, cry to your highness for justice. Far be it from me, however, to insist on the defendant continuing his penny daily; if that be inconvenient, I am willing to accept a compensation in a distinct sum.' The cady now heard what the merchant had to say in reply, and he did not seem at all pleased with it. He remarked that it was a case of very serious oppression; a very bad case indeed, which could not be suffered to go unredressed. If the merchant did not intend continuing the penny for life, he had no business leading the beggar into the idea that he would, by giving him alms so regularly. The notion of now, out of mere caprice, withdrawing a bounty which was essential to the poor man's existence and happiness, and to which he was unquestionably entitled by prescriptive right, was on the face of it absurd. 'Go, sir,' said he in conclusion to the merchant, 'and pay the man his dues. I ordain that you give him a hundred piastres in liquidation of all demands.'——There, what do you think of that? There was gratitude for you.

Gil.—Pooh! only a fable.

Stuke.—A good quiz, you mean; not a bad satire, I take it, on what one often meets with for all his kindness.

BIOGRAPHIC SKETCHES.

THEODORE EDWARD HOOK.

Theodore Edward Hook was born in Charlotte Street, Bedford Square, London, on the 22d of September 1788. His father was a musical composer of talent, in his day and sphere a man of considerable note. Mrs Hook is said to have been an amiable and excellent woman: she died, unfortunately for Theodore, in his fifteenth year, just when he most needed a judicious and affectionate monitor. There was but one other child, Dr James Hook, Theodore's senior by eighteen years, who, when they lost their mother, was already at Oxford, preparing for the church. His life, less brilliant, was happier than his gifted brother's. He rose to due eminence in his profession, and died dean of Worcester.

Theodore had been sent betimes to Harrow; but when his father became a widower, and therefore anxious for the boy's cheerful company, he easily consented to allow him to remain at home. The 'little back drawing-room' was accordingly given up to Master Theodore. Here he settled himself to read novels and farces, or fantasy on the piano, or play the fool with such of his young friends as chose to visit him: nothing could be more pleasant, or more unprofitable. One profitable gift, however, the elder Hook soon detected in his sportful son: Theodore could versify, and versify well, with less trouble than it costs ordinary mortals to pen very indifferent prose. This discovery sealed his fate. The veteran artist took the stripling into partnership. Was a song required—Theodore dashed off the words, while the other composed the music—the junior receiving an equitable share of the proceeds. For the son of a man hand-in-glove with the whole tribe of players and dramatists, the transition from the little back drawing-room, to the spaces both 'before and behind the stage' of Drury Lane, was a natural and an easy one. Theodore was a poet, and even already a wit; his person pleasing, his manners free from timidity; no wonder if he rose into high favour with the ladies and gentlemen of the green-room. Such an atmosphere, and such society, quickly stimulated him to attempt something loftier than song-writing. With the aid of a few French vaudevilles, 'The Soldier's Return, a comic opera, in two acts,' was quickly produced. It was performed at Drury Lane with 'vociferous applause;' and who now so happy as Theodore? This success nearly turned his head, or at least banished from it, and for ever, all thoughts of joining any of the regular professions.

This was in 1805, and during the next few years, operas, melodramas, farces—some of the last, it is said, capital in their kind—flowed in rapid succession from Theodore's pen. But at that time, as the best of his biographers observe, the real farce was his own life. His theatrical ongoings had made him acquainted with the actor Mathews, a merry, thoughtless fellow like himself: both were in the heyday of youth, instinct with fun, and brimful of the wildest animal spirits. Their acquaintance soon ripened into intimacy, and this gave birth to a long series of practical jokes—some audacious, some merely comic—a history of which might fill whole volumes, though of a nature truly more to amuse than to edify. Has the reader ever heard of the 'Berners Street Hoax of 1809?' A neat, quiet-looking residence drew the attention of Theodore and a companion, as they were one day walking through Berners Street. Next moment the wag offered to bet that, before the week was out, this very mansion should be the most famous in London. The wager was accepted, and Hook set to work to win it. Before seven days elapsed, the post had carried a thousand letters, from the pen of Mr Theodore Hook, to a thousand persons of every rank and occupation. Some, on the most plausible grounds, were requested to appear in person; but the majority to deliver goods of one kind or another, on the same hour of the same day, at the innocent and devoted house. On the appointed forenoon, Theodore and his friends were planted at the window opposite, to contemplate and enjoy the proceedings. Precisely at the hour named in all the missives, up drove the Duke of York's carriage; the Archbishop of Canterbury, a cabinet minister, the lord mayor, and a great host of dignitaries, less punctual than his military royal highness, were also under weigh. But arrival was impossible: the thoroughfares, from every point of the compass, were already blocked up with wagons, coaches, brewers' drays, costermongers' carts—vehicles of all descriptions. The hubbub this prank occasioned in London may be easily imagined: we have narrated it, nowise with approval, as a significant emblem of Hook's early life. It was played in the year of his majority.

Such frolics, however, were not calculated to introduce Theodore to those exalted regions of high-life above stairs which his merriment, duly softened, was in after-years so frequently to exhilarate, and whitherwards he was doubtless already casting many a longing glance. For this consummation he was indebted to the most wonderful of all his brilliant social gifts—his faculty of improvisation, a display of which could extort from such a man as the poet Coleridge the assertion, that 'Hook was as true a genius as Dante!' When Sheridan was returned for Westminster, after one of those numerous ever memorable struggles, now so utterly forgotten, the company at Drury Lane celebrated their proprietor's triumph by giving him a dinner, and Theodore was among the guests. In the course of the evening, says Mrs Mathews, 'being in turn solicited, he displayed his talents in extemporaneous singing. The company was numerous, and generally strangers to Mr Hook; but without a moment's premeditation he composed a verse upon every person in the room, full of the most pointed wit, and with the truest rhymes, unhesitatingly gathering into his subject, as he rapidly proceeded, in addition to what had passed during dinner, every trivial incident of the moment. Mr Sheridan was astonished at his extraordinary faculty,' &c. 'could not have believed,' &c. &c.; and, in short, took some pass of the young English improvisatore.

This introduction to the author of the School for Scandal, led to an acquaintance with his son (the 'Tom'

of so many of his jokes), and with other 'persons of quality,' friends of the younger Sheridan. By and by we meet Theodore, delighting and delighted, in the drawing-room of the Marchioness of Hertford. Nay, royalty, or quasi-royalty itself, 'at a supper in Manchester Square,' and 'one or two dinners elsewhere,' deigned to be amused with his witty sallies and lyrical ground-and-lofty tumbling. On the first of these occasions, when the aspirant, then 'a slim youth of fine figure, his head covered with black clustering curls,' took his leave, the Prince Regent placed his hand on his shoulder, and said, 'Mr Hook, I must see and hear you again.' The ball was at Theodore's foot; presently the same illustrious personage was heard to declare, 'Something *must* be done for Hook.'

By the end of 1812 something very effectual *had* been done for Hook: he was appointed accomptant-general and treasurer to the colony of the Mauritius, with a salary of L.2000 a-year. Here was an opportunity, easily, and without the fear of ridicule, to amend whatever was wrong in his way of life. Had the man now shaped his course a little more wisely, he might, indeed, never have edited John Bull, and yet been in all ways a gainer. But he was five-and-twenty, and his days had not been passed in the school where the lessons of self-denial are enforced with stripes. Arrived at his destination in the October of 1813, he continued, on a somewhat higher scale, the game he had already been playing in London. He found a gay, dissipated society stirring around him; balls, theatricals public and private, horse-races, mason-festivities, convivialities without end. He plunged headlong into it all, enjoyed and repaid in kind the boundless hospitality of the place; while the duties of his office were being neglected, or—worse than neglected—left to be performed by dishonest subordinates. Finally, on the evening of the 8th March 1818, some five years and nine months after he had landed, he was supping at a friend's house, when the officers of justice came to seize him. Poor Theodore was dragged by 'torch-light through crowded streets' to the common jail, then handed over to a military detachment homeward-bound, and sailed soon afterwards for England, charged with having embezzled L.20,000 of the public money.

The Quarterly Reviewer has gone, with impartiality and care, into the question of Hook's misconduct, and it seems clear that he was innocent of everything but the grossest carelessness; a sad fault indeed, yet far enough removed from crime. He arrived at Portsmouth in the January of 1819, and was at once, by order of the crown lawyers, released from confinement, to undergo, through a wearisome series of years, the searching examination by the Audit Board. During his absence his father had died. By the close of 1819—friendless, moneyless, disgraced—he had crept into humble lodgings at Somerstown. But the buoyancy of his spirit no misfortune could utterly depress. He sought out the humbler of his old associates, and if he had poverty to vex him, gaiety was there to keep her company. He wrote for theatres and periodicals: he even started a magazine—'The Arcadian.' The queen's business was then engrossing the minds of all, and Theodore had been ever the sturdiest of Tories. In the summer of 1820 he fired the first shot in his fierce campaign against that unhappy personage: it was 'a thin octavo,' in such rhyme as we can fancy. A few months more, and John Bull electrified the world. 'No first appearance of any periodical work of any class whatever has, in our time at least, produced such a startling sensation. It told at once, from the convulsed centre, to every extremity of the kingdom. There was talent of every sort, apparently, that could have been desired or devised for such a purpose. It seemed as if a legion of sarcastic devils had brooded in synod over the elements of withering derision.'

Theodore's salary as editor was rising towards L.2000 a-year, when, in the autumn of 1823, the investigation of the Audit Board was closed: its report pronounced him a debtor to the crown in the sum of L.12,000. His property, forthwith seized and sold, did not fetch as many pence; and his person was handed over to a sheriff's officer named Hemp, to be dealt with as the law prescribes. It was always one of Hook's delusions, founded partly on his John Bull services, that some royal or noble interference would be exerted to have the debt wiped out. For nine months, accordingly, incurring unnecessary expense, he lingered on in his captor's residence at Shire Lane, a dismal and squalid abode. Yet this period was not the most unhappy or even the most unprofitable of his life. His days were devoted to the duties of his editorship, and to the composition of the 'Sayings and Doings.' Of an evening, his friends gathered round him. Dr Maginn, whose acquaintance with him dated from his imprisonment, was a nightly visitor. At last, in the April of 1824, he gave notice that he intended to remove to the King's Bench. Mr Hemp had, meanwhile, been fascinated by the constant glee and good-humour of his lively captive. To break the melancholy of parting, he went the length of inviting him to a festive banquet on the evening before he left Shire Lane. The company was of a mixed description—cultivators of the muses, from Theodore's circle of friends, alternating with select tipstaves, intimates of the worthy host. Ere the night was gone, Hook was called on for an improvisation, 'and his ballad' (says a good authority, for otherwise it were incredible) 'showed up Mr Hemp and his brethren as intrusted with the final office of the law in the case of the culprit before them.'

After a year's detention in the King's Bench, in the May of 1825 he was finally released, with a distinct intimation from the Audit Board, that the debt was to hang over him till paid. Hook was now in his thirty-seventh year, and, with proper prudence, happy days might have still been in store for him. For the first series of 'Sayings and Doings,' published early in 1824, he had received L.2000: the second appeared just before he left the King's Bench. Both placed him high among the highest of then living novelists. His emoluments from John Bull were, as already stated, uncommonly large. Thus, in a short time, with economy and diligence, independence was sure for him. Will it be believed, that although, during the next sixteen years, he wrote thirty-eight volumes, and added the editorship of the New Monthly Magazine to that of John Bull, not a farthing of the large sums this productive industry brought him was devoted to extinguish his debt to the crown?

On quitting jail, he took a good house at Putney, and began to mix in society, though chiefly of a theatrical and literary kind. Two years afterwards, however, he migrated to a large and handsome residence in Cleveland Row (of London Proper), gave dinners on an extensive scale, and became a member and frequenter of several aristocratic clubs, 'especially'—fatal words—'such as allowed of play.' His visiting-book soon included all that was loftiest and gayest, and in every sense most distinguished in London society. The editor of John Bull, *the* fashionable novelist, the wittiest and most vivid talker of the time, his presence was not only everywhere welcome, but everywhere coveted and clamoured for. But the whirl of extravagant dissipation emptied his pocket, fevered his brain, and shortened the precious leisure in which alone his subsistence could be gained. In the midst of it all, he saw impending over him the Damocles sword of debt. In 1831 he removed, indeed, to a humbler residence at Fulham, but his habits in other respects suffered no change. At home, too, he had entangled himself in domestic relations to which it is painful to refer. There were, it is true, constant internal struggles and protests against all this madness, yet, practically, Theodore surrendered himself with open eyes to his fate; he never (until, for human purposes, too late) made any one real and forcible attempt to break the baleful spell which chained him to a course of life inwardly and outwardly ruinous. The vigour of the following apt quotation must excuse its length.

'There is recorded,' in his Diary, 'in more than usual detail, one winter visit at the seat of a nobleman of almost unequalled wealth, evidently particularly fond of Hook, and always mentioned in terms of real gratitude, even affection. Here was a large company, including some of the very highest names in England: the party seem to have remained together for more than a fortnight; or, if one went, the place was filled immediately by another not less distinguished by the advantages of birth and fortune. Hook's is the only untitled name, except a led captain and chaplain or two, and some misses of musical celebrity. What a struggle he has to maintain! Every Thursday he must meet the printer of "John Bull," to arrange the paper for Saturday's impression. While the rest are shooting or hunting, he clears his head as well as he can, and steals a few hours to write his articles. When they go to bed on Wednesday night, he smuggles himself into a post-chaise, and is carried across the country to some appointed "Blue Boar" or "Crooked Billet." Thursday morning is spent in overhauling correspondence, in all the details of the editorship. He, with hard driving, gets back to the neighbourhood of the castle when the dressing-bell is ringing. Mr Hook's servant has intimated that his master is slightly indisposed. He enters the gate as if from a short walk in the wood. In half an hour, behold him answering placidly the inquiries of the ladies—his headache fortunately gone at last—quite ready for the turtle and champagne—puns rattle like a hail-shower—"that dear Theodore" had never been more brilliant. At a decorous hour the great lord and his graver guests retire: it is supposed that the evening is over, that the house is shut up. But Hook is quartered in a long bachelors' gallery with half-a-dozen bachelors of different calibre. One of them, a dashing young earl, proposes what the Diary calls "something comfortable" in his dressing-room. Hook, after his sleepless night and busy day, hesitates; but is persuaded. The end is, that they play deep, and that Theodore loses a great deal more money than he had brought with him from town, or knows how to come at if he were there. But he rises next morning with a swimming, bewildered head, and, as the fumes disperse, perceives that he must write instantly for money. No difficulty is to be made. The fashionable tailor (*alias* merciless Jew) to whom he discloses the case must, *on any terms*, remit a hundred pounds by return of post. It is accomplished—the debt is discharged. Thursday comes round again, and again he escapes to meet the printer. This time the printer brings a payment of salary with him, and Hook drives back to the castle in great glee. Exactly the same scene recurs a night or two afterwards. The salary all goes. When the time comes for him at last to leave his splendid friend, he finds that he has lost a fortnight as respects a book that *must* be finished within a month or six weeks, and that what with travelling expenses hither and thither (he has to defray the printer's too), and losses at play to silken coxcombs—who consider him as an admirable jack-pudding, and also as an invaluable pigeon, since he drains his glass as well as fills it—he has thrown away more money than he could have earned by the labour of three months in his own room at Fulham. But then the rumble of the green chariot is seen well stocked with pheasants and hares, as it pauses in passing through town at Crockford's, the Carlton, or the Athenæum; and as often as the "Morning Post" alluded to the noble peer's Christmas court, Mr Theodore Hook's name closed the paragraph of "fashionable intelligence."'* *Sunt lachrymæ rerum!*

Hook's life was tending towards no peaceful and desirable goal; and though to the outward eye, almost to the last, the same polished and joyous worldling as ever, his inner man was racked by mournful fears and chagrins. Let us hear himself speak.

'January 19, 1837.—Another dreadful, miserable, dark, and dreary day. Letter from my sister-in-law; she praises my industry, and pities my poverty. My poverty is painful, not on my own account, but on that of others; and because, though I have, through God's goodness, been most fortunate in my literary undertakings, I have uselessly wasted not only money to a great extent in useless things, but have also wasted the time which would have reimbursed me. It is never too late to mend; and I now work night and day, and only wonder, when I look back, that I should have been so foolish as to waste the prime of life in foolish idleness.

'September 6, 1838.—To-day invited by Sir Edward Sugden to meet Lord Granville Somerset, Dr Ros, Croker, and others agreeable; but said no. * * How little people think of the griefs and sorrows of those whom they hear only in public, and then not always favourably!'

The following is the last entry in his diary. 'June 20, 1841.—To-day ill, but in to dinner to Lord Harrington's, to meet the Duke of Wellington. There Duke and Duchess of Bedford, Lord and Lady Southampton, Lord Londonderry, Lord,' &c. &c.

The illness here spoken of had been gaining on him for some time; it sprang from a 'total disorganisation of the liver and other viscera.' He continued ailing throughout the summer. On the 13th of August, after a hard day's work of writing, he 'retired in great exhaustion to his bed.' He expired on the evening of the 24th.

This is a biographical, and not a critical sketch: an estimate of Hook's well-known, on the whole perhaps somewhat trivial, and at any rate easily appreciable writings, it is not our intention to offer. His life, indeed, in the full record of it to be one day doubtless presented to the world, will be probably more interesting, certainly far more instructive, than any works he has left behind him. Would that for us all it were as easy to follow out in practice, as to enforce and assent to be true, the pithy maxim, 'Wrong never comes right,' which, meeting us repeatedly in his books, has been seldom so vividly exemplified as in the life of Theodore Edward Hook.

* Quarterly Review, No. 143, Art. "Theodore Hook;" a masterly essay, from a pen not to be mistaken.

THE RETURNED SLAVE.

AN ANECDOTE FROM THE ITALIAN OF SOAVE.

A NOBLEMAN being at a state banquet, given at Marseilles, was anxious to refresh himself by taking a few turns in a boat on the river. He accordingly called for a boatman, when a pleasing looking youth, with a most gracious manner, offered himself. The nobleman was induced to look at him attentively, seeing him possessed of more refined manners than are usually met with in that rank of life. 'You do not row,' he said, 'as if you were a sailor; and I cannot understand that, if it is not your trade, you could undertake such a severe exercise for recreation.'

'I was not born, indeed,' replied the youth, 'in this rank of life, nor is this the trade I belong to; but the misfortunes of my father have obliged me to take to it, to earn a trifle on festival days.'

'And what misfortunes have happened your father?' said the nobleman.

'He is a slave,' replied the youth in a state of distress; 'and I have no means of ransoming him but by the most severe labour and fatigue.'

'A slave! And how long, and where?'

'He is now six months in chains at Tetuan. He formed a small capital by his earnings, freighted a ship, went in it himself, industriously wishing to make the most of it; but unfortunately it was seized by the Moors, and he and the crew were made slaves. Two thousand crowns they require for his ransom; but as he took all our property with him, we are very far from being able to procure so large an amount. My mother and sister work day and night to assist in collecting the

sum, and I do the same; therefore I wish to take advantage of every opportunity of adding to our earnings. At first I thought to be able to liberate him by taking his place; but my mother (who suspected my plan) assured me that my design was useless; and fearing, not without some reason, that I still might venture, forbade all the captains to take me on board.'

'Have you not heard anything of him since? Do you know whom he serves, and in what way he is treated?' asked the nobleman.

'He is the superintendent of the royal gardens, and is treated humanely. But, alas! this is small comfort for him; he is a slave, and far from all those most dear to him.'

'What is his name and age?

'Robert; and he is nearly fifty-five years of age.'

'You have my best wishes, and certainly are deserving of better fortune. From your good conduct, I think I may promise it to you.'

Night coming on, the nobleman desired him to land him, and, jumping out of the boat, would not allow the youth time to thank him for the purse of money which he left in it as a reward. The young man, surprised at such generosity, for many days sought the nobleman to express his gratitude; but in vain. Two months afterwards, while this poor but honest family were at their scanty dinner, to their utter amazement Robert arrived. A scream of joy and surprise escaped them: they even doubted the reality of their vision. He tenderly embraced each one: 'My wife and my children,' he exclaimed, 'how deeply indebted I am to you; but tell me, how have you been enabled to release me? The sum required for my ransom was enormous: these clothes, and my passage paid beforehand, all astonish me. Alas! to what a state of misery do I see you have reduced yourselves for me.'

The sudden joy quite overpowered his wife, who had not strength to answer, until relieved by a flood of tears. She again embraced her husband, and pointing to her son, said, 'You see in him your liberator; we never could have collected the immense sum required, were it not for his indefatigable exertions, aided by those of a charitable nobleman who was struck by his amiability. To that boy you certainly owe your freedom: he even secretly arranged to exchange with you.'

A shriek from her daughter interrupted her, and on turning round she perceived her son had fainted. The first symptom of returning consciousness was a vacant gaze at his father. Making a vain effort to speak, the poor father was struck dumb by the sudden transition from joy to grief, and turning to his son in an angry manner, he exclaimed, 'Alas! unfortunate youth, what have you done? I cannot feel myself indebted to you for this liberty without shuddering. If my ransom had not caused you to commit some crime, you would not have dared to conceal it from your mother. The son of a miserable slave, and in these wretched times, it is not likely that by honest means you could have procured such assistance. I tremble at the thought of your filial love leading you into crime. Relieve me from this uncertainty; if it is true, I would rather——'

'No, no; compose yourself, father; embrace your son: I am not yet unworthy of that name; for it is neither to me nor one of us that you are indebted. Our benefactor is quite another person. Indeed, mother, it is to that stranger who gave me the purse in such a generous manner that we owe our happiness. Oh, if I could meet him! If I could—— But I will leave no stone unturned to discover him.' He then related to his father how he had met the stranger, and thus eased his mind of all uncertainty.

After two years of useless inquiry, one morning the youth chanced accidentally to meet the object of his search.

'Ah! my lord, my benefactor!' He could say no more, but threw himself at his feet.

'What do you want? What is all this?' said the stranger.

'My lord, do you not know me? Have you forgotten the son of the unfortunate Robert whom you so generously saved?'

'You mistake, my friend; I am a stranger only just arrived.'

'That may be; but do you not recollect being here about two years and a half since? Let me remind you of the few turns you took on the river; the purse that you gave me; the compassion you felt for my father's misfortunes; the numerous questions you asked on whatever could throw light on the means for his liberation. You have thus formed the happiness of an entire family, who desire nothing now but your presence, to heap it with a thousand blessings. Alas! do not deny us our wishes.'

'Softly, my friend; you are too easily deceived; you perhaps——'

'No; I am not deceived; your features are too deeply impressed on my mind ever to forget them. Receive our thanks.' He then seized him by the arm, and tried to induce him to return with him to his home, and witness the happiness which he had been the means of restoring. The contrast between the two attracted a crowd round them. The unknown person was in the height of his glory; but instead of showing his astonishment, he had the courage to repress it, and still to remain in concealment.

This fact would have remained for ever a mystery, if, on the death of a Marseilles merchant, his relations had not found among his papers a note for 7500 francs, 'sent to Robert Meryn à Cadice,' and for which there was no receipt. A famous English banker said he had made use of this money, by the orders of Signor Charles, second Baron de Montesquieu, president of the parliament of Bourdeaux, for the ransom of an inhabitant of Marseilles, called Robert, enslaved at Tetuan. This celebrated man was in the habit of occasionally visiting his sister, Madame d'Hericourt, who was married at Marseilles.

The generous action which he performed, and which we have now related, does not merit less commendation than his literary labours, by which he has rendered his name immortal.

DUNCES.

We find the following humorous and judicious remarks on this ill-understood class of school-boys, in a speech delivered by Mr Macintosh, at a late meeting of the Forfar, Fife, and Perthshire Educational Association:—

We all know what great bores dunces are in schools, and how readily the master's choler is awakened by their laggard motions. They, however, often serve a purpose. Without dunces, our classes would not present the striking contrast which they often exhibit; the dunces are the dark shades in the picture, which throw the talented youth more prominently into view. They, moreover, offer an opportune occasion for the wit, the sapient counsel, and thundering reproof of the master; and should he enforce his argument by 'suiting the action to the word'—

> 'Full well the boding tremblers learned to trace
> The day's disasters in his morning face;
> Full well the busy circle, whispering round,
> Conveyed the dismal tidings when he frowned.'

Though the days of indiscriminate castigation are gone by, and dunces enjoy an exemption formerly unknown under the reign of terror, they are not yet treated with the rational consideration, and consequently with that *justice*, which their circumstances demand. Let us analyse the character of a dunce as he is too often impersonated. There are several species of dunces. There is first the *incapable*, to whom nature has been niggard in the power of observation, discrimination, reflection, and memory. An unfortunate of this class is sent to school, and yoked with class-fellows of his own age. His natural imperfections speedily appear; he falls astern at a fearful rate; he soon becomes powerless in contending with his gifted compeers, who look on him with indifference and contempt. He then becomes a dead weight on his class,

and provokes, too often, the ire of his master to punish him for what he is incompetent to perform. What consequences follow? The natural incapables are often quiet and patient, and very passive under discouragements and disgrace; they *feel* their case to be hopeless, and despairingly resign themselves to their fate.

Another section of dunces stand nearly on a level with the natural incapables with respect to scholastic progress, because they have not been trained to habits of attention, observation, application, order, and obedience. They have been spoiled by too much indulgence; or, it may be, have been entirely uncared for, and left to the government of their appetites and passions, a prey to the depraved propensities of human nature. At school they are the *moral* incapables. Though seen at the fag-end of a class, careless, unprepared, and unashamed, they are never at the fag-end of play and mischief; in fact, idleness and mischief are their element. As far as my experience goes, the *natural* incapables are not a numerous class, which is one of the many evidences of the beneficence of the Creator. But the *moral* incapables include a much larger proportion, which proves the lamentable irregularities in domestic training.

There is a third class of an intermediate character—*reputed* dunces—but falsely so called, who possess a delicate physical organisation, and a most sensitive mental constitution, whose faculties are paralysed by anxiety and fear, who tremble at the slightest difficulty, and sink under the slightest discouragement. They resemble those beautiful plants that bloom in the genial atmosphere of a greenhouse, but are blasted on being exposed to the mercy of the elements. Above a dozen years ago a case of this kind fell under my observation. The boy to whom I allude had the most sensitive feelings I ever knew. I was made aware of his very susceptible mental temperament, and treated him with kindness and care. The youth had excellent parts, and made satisfactory progress. Without reflecting on the probable consequences, his father placed him under the care of a master to learn a foreign language; the nerves of the poor youth were unequal to the excitement of competition—he fevered and died. There was no blame attachable to his teacher. The poor youth was too sensitive for the region of competition, unfit to struggle with robust and hardy boys. As we are to take an interest in dunces generally, or those who are reputed dunces, would it not be well, if we who are professional men, would carefully set ourselves to consider whether it is not possible to devise a more rational mode of treating these different classes? It is true we may be goaded and annoyed by ignorant parents, who expect all children to make equal progress. But there are considerations superior to temporary gain, of which we ought never to lose sight. Why does a skilful physician so carefully study the diagnostics of any disease as it may be exhibited in the cases of his patients? He does so to meet the case fairly, to maintain his professional skill and credit; and he is actuated by the higher motives of humanity and kindness. These principles and feelings should induce us to rise superior to temporary advantage, to be above the influence of unreasonable and ignorant parents, to study our profession, and make our duty the pole star to which our exertions should be directed. We will thereby be benefactors of our species, we will rise in our respective spheres, and we will enhance our profession in the estimation of society. Do not these reflections suggest that the classification of children labouring under natural and moral disqualifications is unadvisable and absurd? Is it not treating them cruelly and unjustly, to place them among competitors with whom they have no chance of success? What opinion would we entertain of a proposal to match cripples in a race with youths of sound limbs and strong sinews? It is impossible to calculate the extent of injury, physical and mental, thus inflicted. In the treatment of unfortunates—misnamed dunces—parents unhappily reverse the maxims they scrupulously adopt with the health of enervated and sickly children. A poor youth who cannot move beyond the speed of a tortoise, being encouraged for doing all that he is able to do, will exert his small energies to the utmost, and take a pleasure in his labour, when he is not taxed beyond his ability. What is it that renders the labour of a teacher so irksome, but the false position in which he is placed by such unnatural arrangements? Who can tell how many intellects have been marred by unskilful treatment? The error of the modern and improved system of education, is the enormous speed with which the youthful travellers are hurried forwards. We cannot make plants and trees grow faster than Nature intends, consistently with their health and vigour.

It is well known that precocious talents in youth disappear in manhood; like those beautiful but evanescent flowers which spring puts forth, and which perish in spring. A remarkable case of this sort is recorded in the fifth volume of the Journal of Education of the Society for the Diffusion of Useful Knowledge:—'We allude to Von Shonach's Memoir of Christian Henry Heinnecken, who was born at Lubeck on 6th February 1721, and died 27th June 1725. His life, therefore, did not reach beyond the brief span of four years and nearly five months; yet within so short a career as this, the child exhibited such marvellous proofs of intellect and memory, that we should be tempted to doubt their possibility altogether, were not every incident corroborated by the testimony of parties of the very highest respectability. At the age of ten months young Heinnecken began to speak; it was whilst he was looking at some prints, which he wished to have explained to him. Whilst the explanation was giving, it was casually observed that the child watched the motions of the speaker's lips with a singular degree of earnestness; and then, though not without great exertion, he succeeded in repeating what had been said syllable by syllable. From that day forward his progress was most extraordinary: at the age of one year he was conversant with all the leading events in the five books of Moses; at thirteen months he had mastered the history of the Old Testament; and at fourteen the history of the New. By the month of September 1723, he had acquired so perfect a knowledge of ancient and modern history, as well as geography, that he could answer any question put to him, on circumstances connected with either of them, without a blunder. He now stored his memory with a host of Latin words; and in a short time was able to express himself with tolerable fluency in the language. No great time elapsed before he mastered French; and ere he had reached his third year he made himself thoroughly acquainted with the genealogies of the principal families in Europe. A considerable portion of his fourth year was consumed in travelling through Denmark, where his rare precocity was a theme of admiration with the whole court, amongst whom were the king and his son; and with them he entered into conversation, without betraying the slightest shyness. On his return to Lubeck he learned to write, which with him was the operation of a few days: but his brief and meteor-like course was on the wane; he gradually declined, and became worse as month succeeded month; and was at length released from his sufferings. His fragile frame of body exhibited a remarkable contrast with the unprecedented strength of his mind; and strong, indeed, it must have been to have withstood the ravages of frequent and severe indisposition. Nor is it less remarkable, that the child was not weaned from his nurse until a few months before his death; for he had a violent antipathy against every species of nourishment but milk.'

Who can imagine that the life of this learned infant was not sacrificed to the vanity and mismanagement of his inconsiderate parents? If, by a more rational treatment, the *health* of this child had been the chief solicitude of his parents, and his life had been prolonged, his story would be less marvellous indeed; but he might have benefited society by the matured development of his rare endowments. The same false estimate of talents is not unfrequently seen in the angry and disappointed feelings of parents exhibited at public examinations. 'Why is my son not dux?' mutters a father, as he sees his son half-way down a class. He does not reflect that there can be only one dux at a time; and that a youth lower in station may carry away as much solid and useful learning as the highest scholar in the class. About sixty years ago, there were at the parish school of St Andrews two youths, who showed so little aptitude to learn, and who annoyed and irritated their master so much, that he dismissed them from school as incorrigible dunces. The boys were Thomas Chalmers and George Cook.* Will posterity award the unenviable honour of dunce to Dr Chalmers and Dr Cook, or to their teacher? When Sir Isaac Newton first went to school, he was a weakly child and a reputed dunce. Sir D. Brewster, in his Life of Newton, informs us that the dormant energies

* Dr George Cook died in 1845, Professor of Moral Philosophy in the University of St Andrews. He was author of two historical works, and for several years led one of the parties of the Scottish Church.

of the embryo philosopher were aroused into activity by one of his class-fellows giving him a violent blow in the stomach for sluggishness and inattention to his lessons. Newton determined to be revenged, and applied to his task with such diligence and success, that he speedily distanced his competitors. Instances of a similar kind might be plentifully gleaned from the biographies of eminent men, who in childhood were reputed dunces. Enough has been said to show that dunces are worthy of our special attention. Will my professional friends excuse me for suggesting that the offensive name Dunce should be discontinued? If we must mark this *status*, let us employ a more appropriate and scholastic epithet. I propose then to erase Dunce, and substitute *Under-graduate*.

MINUTENESS OF ANIMAL LIFE.

Take any drop of water from the stagnant pools around us, from our rivers, from our lakes, or from the vast ocean itself, and place it under your microscope; you will find therein countless living beings, moving in all directions with considerable swiftness, apparently gifted with sagacity, for they readily elude each other in the active dance they keep up; and since they never come into rude contact, obviously exercise volition and sensation in guiding their movements. Increase the power of your glasses, and you will soon perceive, inhabiting the same drop, other animals, compared to which the former were elephantine in their dimensions, equally vivacious and equally gifted. Exhaust the art of the optician, strain your eye to the utmost, until the aching sense refuses to perceive the little quivering movement that indicates the presence of life, and you will find that you have not exhausted nature in the descending scale. Perfect as our optical instruments now are, we need not be long in convincing ourselves that there are animals around us so small that, in all probability, human perseverance will fail in enabling us accurately to detect their forms, much less fully to understand their organisation! Vain, indeed, would it be to attempt by words to give anything like a definite notion of the minuteness of some of these multitudinous races. Let me ask the reader to divide an inch into 22,000 parts, and appreciate mentally the value of each division: having done so, and not till then, shall we have a standard sufficiently minute to enable us to measure microscopic beings. Neither is it easy to give the student of nature, who has not accurately investigated the subject for himself, adequate conceptions relative to the numbers in which the infusoria sometimes crowd the waters they frequent; but let him take his microscope, and the means of making a rough estimate at least are easily at his disposal. He will soon perceive that the animalcule inhabitants of a drop of putrid water, possessing, as many of them do, dimensions not larger than the 1·2000th part of a line, swim so close together, that the intervals separating them are not greater than their own bodies. The matter, therefore, becomes a question for arithmetic to solve, and we will pause to make the calculation. The *Monas termo*, for example—a creature that might be pardonably regarded as an embodiment of the mathematical point, almost literally without either length, or breadth, or thickness—has been calculated to measure about the 22,000th part of an inch in its transverse diameter; and in water taken from the surface of many putrid infusions, they are crowded as closely as we have stated above. We may therefore safely say, that, swimming at ordinary distances apart, 10,000 of them would be contained in a linear space one inch in length, and consequently a cubic inch of such water will thus contain more living and active organised beings than there are human inhabitants upon the whole surface of this globe!—*Rymer Jones.*

INFLUENCE OF PATERNAL FAME.

The son of a celebrated man enters upon his career crushed rather than supported by the name which he bears. His earliest efforts, which would be judged of with indulgence if they proceeded from a new man, are found unworthy of the brilliant renown of the name under which they are brought forward. Like a planet which is too near the sun, he cannot sufficiently divest himself of the rays of the paternal glory, to shine by his own light; he is discouraged, and too often contents himself with the borrowed splendour he derives from this source.—*Professor Macaire.*

'HATEFUL SPRING!'

[FROM THE 'CHANSONS' OF BERANGER.]

All the winter, from my window,
Have I watched a damsel fair;
Loving, though we both were strangers,
Sending kisses through the air.
Gazing through her leafless lattice,
Every day did pleasure bring:
Now green boughs the lattice shadow—
Why return'st thou, hateful spring?

In that thick and verdant cover
The sweet graceful form is lost
Which I daily saw there, throwing
Food to poor birds through the frost;
Those dear warblers were the signal
Of our love's awakening:
Snow of all things is most lovely—
Why return'st thou, hateful spring?

But for thee I still might see her
Rising fresh from sweet repose,
Rosy, as when young Aurora
Dawn's gray curtains does unclose;
And I still might say at even,
When her lamp is vanishing,
'Now my star has set—she slumbers'—
Why return'st thou, hateful spring?

How my fond heart prays for winter!
How I long to hear again
Sleet and hailstones lightly beating
Music on the window pane.
Flowers and zephyrs, summer evenings,
Unto me no joy can bring,
Since I see my love no longer—
Why return'st thou, hateful spring?

D. M. M.

ECONOMY IN KNOWLEDGE.

Old-fashioned economists will tell you never to pass an old nail, or an old horse-shoe, or buckle, or even a pin, without taking it up; because although you may not want it now, you will find a use for it some time or other. I say the same thing to you with regard to knowledge. However useless it may appear to you at the moment, seize upon all that is fairly within your reach; for there is not a fact within the whole circle of human observation, nor even a fugitive anecdote that you read in a newspaper or hear in conversation, that will not come in play some time or other: and occasions will arise when they will, involuntarily, present their dim shadows in the train of your thinking and reasoning, as belonging to that train, and you will regret that you cannot recall them more distinctly.—*William Wirt.*

PECULIARITY OF TALENT.

Every system of teaching must be defective which has no reference to the characteristic talent of the scholar, who, though he may be a dunse in classics, and slow of recollection, may possess a turn of mind which will one day lead him to great discoveries, and rank its possessor amongst the most eminent of mankind. Supposing Newton had neglected those pursuits for which he was so fitted, and had applied himself to poetry; instead of developing the law of gravitation, elucidating Optics, and composing the Principia, he might have been the writer of rhymes and verses unfit even for the public eye. He would have been acting in opposition to nature, and, not perceiving the source of his strength, might have exhausted his diligence ineffectually. Let your studies, then, be in relation to the mind, unless you would prefer irksome toil to pleasant labour, a scanty produce to a teeming harvest. Many are the instances of men of genius persisting in their favourite occupation, in spite of the opposition and censures of their friends: and they were right, for they well knew the seat of their power, and saw what no one could see besides them. The father of Pascal denied him Euclid, but he could not prevent him being a mathematician.—*W. F. Barlow.*

No. 111. New Series. SATURDAY, FEBRUARY 14, 1846. Price 1½d.

LLOYD'S.

The greater number of persons must have heard of 'Lloyd's,' but comparatively few, we believe, are aware of the precise meaning of the term. 'Lloyd's' is an institution nestling in the heart of London, and finding accommodation in certain apartments in the north and east sides of the Royal Exchange. In these apartments the greater part of the business of the entire mercantile navy of Great Britain is transacted. Lloyd's is known everywhere; for there is not a newspaper published in any part of the globe but has some allusion to it. It is a focus in which is collected every noticeable event concerning every ship that sails from British, and occasionally from continental ports. The establishment consists of a fraternity of ship-assurers, technically, 'underwriters;' in other words, subscribers to bonds which they enter into, to insure the proprietors of ships and freights from losses at sea.

A visit to this nucleus of shipping business and shipping news is full of interest. It is a spot whence branch out chains of communication to the 'uttermost ends of the earth.' Wherever civilisation has once set her foot, there some direct or indirect agent is ready to take note of any ship that may appear in sight, and to give help to any which may need it; and by his reports such circumstances, be they ever so trifling, find their way in due time to Lloyd's. But besides the abstract interest the place excites, the eye is filled with the grandeur and architectural beauty of the apartments; and nowhere are the sweeping changes to which the city of London is subject—now more perhaps than at any former period—so apparent as at Lloyd's. Formerly, one of the wonderments created in the eyes of visiting provincials, was the disproportion existing between the vastness of the operations of the mercantile world, and the mean, petty, and inconvenient places in which these were carried on. In dark, dingy, and scarcely wholesome chambers, millions of money changed hands, and transactions were completed the effects of which were sometimes felt by whole nations. Now, however, metropolitan improvement has changed those confined offices for others more worthy of the importance of the business transacted in them. The history of Lloyd's exemplifies the progress of this kind of change very aptly.

The man who gave his name to this great system of sea-insurance and maritime intelligence was a humble individual, the keeper of a coffee-house in Lombard Street; and here the underwriters used to assemble, as a convenient spot near the Royal Exchange, the centre of British commerce. At what period Lloyd died is unknown, and little can be told regarding him. Allusion is made to his coffee-house as a place for auctions, in a poem entitled *The Wealthy Shopkeeper*, published in 1700—

> 'Then to Lloyd's coffee-house he never fails,
> To read the letters, and attend the sales.'

In 1710, Sir Richard Steele dates from it (Tatler, No. 246) his Petition on Coffee-house Orators and Newsvenders: Addison also, in the Spectator for 23d April 1711, makes Lloyd's Coffee-house the scene where one of his papers of minutes was dropped, and the boy was ordered by the merry gentleman there to get up into the auction pulpit and read it to the whole room. The auction business then transacted at Lloyd's is now transferred to Garraway's Coffee-house. We know little more of the early history of the former, besides the fact, that the underwriters seem to have frequented it from a still earlier period. Their 'list' for June 7, 1745, a copy of which is still extant, is No. 996, and as it had hitherto been published once a-week, we may suppose the publication to have then been about eighteen years established. It would seem that the merchants meeting at Lloyd's had in time found their accommodation there inadequate, for on the 13th December 1771, there is an agreement, signed by seventy-nine underwriters, to pay L.100 each, in order to obtain a lease of two houses in Freeman's Court, Cornhill; and this arrangement not being effected, they actually took a lease of the British Herring Company's offices in the Royal Exchange, where, with subsequent additions, they remained till the whole building was destroyed by fire a few years ago. It was only for a time that the members of Lloyd's were driven from this well-known resort. On the renovation of the Exchange buildings, they took possession of handsome and commodious new premises; and it is these which, with this scanty historical information, we are now prepared to enter.

Proceeding to the north end of the eastern outer portico of the Royal Exchange, progress is stayed by two large glazed doors, which, yielding to a slight pressure, open at the foot of a handsome flight of stairs. Each step is formed of a single stone, fourteen feet long, brought from the Craigleith quarries near Edinburgh. At the top of this noble staircase you enter a spacious hall, whence ingress to the different departments is obtained.

The first room into which we were shown is a comparatively small one. Around the walls are reading desks, breast high, one of which occupies the middle of the room. Half way between the ceiling and the floor is a gallery, like that of a library, used for consulting the rollers of maps with which the walls are lined. This may perhaps be regarded as the most important room in the house, and is certainly the most exciting one to the parties concerned. It contains a number of indices, by means of which the registers of haps and mishaps, as they are daily reported, may be readily

consulted. When we entered, several persons were turning them over, and tracing, with careful finger, the columns in search of the name of the ship in which they were interested. Having been referred to the proper spot on one of the pages of two enormous ledgers, called 'Lloyd's books,' they there obtain the information they seek. If their ship has been merely met on the high seas by another, or 'spoken with,' or has touched or arrived at a particular port, the news is entered against the name of the ship in ordinary characters; but if any accident has happened—a wreck, a fire, a severe collision—it is recorded in large characters, occupying two lines; hence the technical phrase applied to such casualties—'double lines.' The moment the doors of the establishment are opened (at ten o'clock in the morning), there is a crowd of persons ready to rush to these ominous books, especially when the weather has been stormy; and many an insurer leaves them with the knowledge that he is by many thousands poorer than he had reason to expect before consulting them.

This apartment may be regarded as a small section of the larger and more important underwriters' room—as noble a place of business as exists anywhere. It is one hundred feet long and forty-eight feet wide; the roof, which is beautifully ornamented, is supported by two rows of scagliola columns. It is fitted up with mahogany tables and seats for the accommodation of the subscribers. These are of two classes: first, 'underwriters,' who are the actual insurers of ships; and second, insurance brokers. In all commercial transactions of a large and complicated kind, the broker, or middle-man, is indispensable. A merchant who wishes to insure a particular sort of goods going by sea, could not effect the transaction at once with an underwriter, from his not knowing the exact man whose connexions lie in his particular branch of commerce, or who is willing to purchase the risk. While he is hunting for such a person, his goods may have been shipped, and perhaps sunk to the bottom of the sea. But the broker obviates this. He is ready to deal both with insurers and insured at all times, and makes his profit by contracting for the risk from the latter, at a trifle higher rate than he effects it with the former. By his agency, in short, an open market is always kept, and in this respect no broker is so useful as the insurance broker.

It is not possible to conceive a more exciting life than that of the underwriter. A sudden change of weather, or the non-arrival of a ship at the time she is expected or is 'due,' sinks him from the highest hopes of profit down to the deepest dread of loss. Some branches of the business approach the verge of gambling; at all events, the risks of marine insurance are much less easily reckoned, and are of a far less precise kind, than those of life or fire insurance. Yet wonderful efforts are made to give it certainty: the age and soundness of the ship, the kind of cargo with which she is laden, the part of the world to which she is going, the time of year, and even the skill and character of the captain who commands her, are elements in the calculation. Sometimes insurances are increased, or new ones effected, while the ship is at sea: when she has not been met with by other vessels reported to have crossed her track, or when she has delayed her arrival into home-port, the rate is augmented, according as the chance of some accident is great. The steam-ship 'President,' which went down a few years ago, and has never since been heard of, was 'done,' or, in other words, risks were taken on her in the Underwriters' Room, at a very high premium, up to the latest minute of hope. Underwriters are found who do not object to speculate on the safety of ships in equally desperate circumstances, or, to use their own slang, 'to take a few thousands on them at a very long price;' and vast sums of money are daily won and lost in this way. This *is* gambling.

To assist the underwriters in their calculations, not only the earliest and most ample news of actual events is provided, but every means which science can suggest is employed to guide them as to probabilities. At the end of their room is a machine called an Anemometer, which registers the state of the wind during every hour of the day and night. Thus, when a subscriber arrives in the morning, he can see which way the wind has blown during any hour he has been asleep, and how hard it has been blowing, over and past the Royal Exchange. From data thus obtained, he can make his calculations respecting any other part of Europe in which the craft he may be interested in is floating; for a more weather-wise body than underwriters and insurance brokers does not exist. This ingenious and accurate instrument merits some notice in passing.

On the top of the Royal Exchange may be seen a sort of mast, at the top of which is a fan, precisely like that attached to a modern windmill, the object of which is to keep a plate of metal with its face presented to the wind. Attached to this plate are springs, which, joined to a rod, descend into the Underwriters' Room upon a large sheet of paper placed against the wall. To this end of the rod a lead pencil is attached, which slowly traverses the paper horizontally, by means of clock-work. When the wind blows very hard against the plate outside, the spring, being pressed, pushes down the rod, and the consequence is, that the pencil makes a long line down the paper vertically, which denotes a high wind. At the bottom of the sheet another pencil moves, guided by a vane on the outside, which so directs its course horizontally, that the direction of the wind is shown. The sheet of paper is divided into squares, numbered with the hours of night and day, and the clock-work so moves the pencils, that they take exactly an hour to traverse each square; hence the strength and direction of the wind at any hour of the twenty-four is easily seen. Attached to this machine is also a rain-gauge. By consulting it, therefore, the underwriter collects some facts which guide him in his operations during each hour of his business-day.

The number of subscribers to the Underwriters' Room has been estimated at from one thousand to eleven hundred. They include three descriptions of persons:—1st, Those who insure at their own risk, and with their own capital; 2d, Those who represent, at a salary, the various marine assurance companies: each of these classes pays twenty-five pounds as an entrance-fee, besides an annual subscription of four guineas; 3d, Brokers, who pay the yearly four guineas only. The sums thus collected and accumulated make the establishment exceedingly rich. As some proof of its wealth and liberality, we may mention that, when Napoleon threatened an invasion, Lloyd's opened a subscription, upon an extensive plan, for the encouragement and reward of sufferers, and the relief of their widows and orphans. They commenced themselves the subscription nobly, transferring to it the sum of L.20,000, 3 per cent. consols, under the name of the 'Patriotic Fund,' which subsequently amounted to L.700,000. During its progress, Lloyd's added to their former subscription, in 1809, L.5000, and in 1813, L.10,000; thus making L.35,000 in all. They have also contributed munificently to other public funds: for instance, L.5000 to the London Hospital, for the admission of seamen employed in the commerce of London; L.1000 for the suffering inhabitants of Russia in the year 1813; L.1000 for the relief of the militia in our North American colonies, 1813; L.10,000 for the Waterloo subscription in 1815; and L.2000 for the establishment of lifeboats on the coast. They have also done, and are annually doing, much for the relief of private distress occasioned by disasters at sea; and, waiving all considerations of political power, which they do not aspire to, are almost as efficient as the Foreign Office itself in defending our seamen from the abuse of distant and less civilised powers. The committee also vote medals and rewards to those who distinguish themselves in saving life from shipwreck.

The regularity and punctuality with which the subscribers to Lloyd's pay their losses is proverbial. So soon as the various documents required to substantiate

a loss are presented to the underwriter, the loss is, as they express it, 'written off;' that is, adjusted; and one month after, the amount is paid. Such is the regularity with which these payments are made at Lloyd's, that a merchant can calculate on receiving the amount of a loss 'one month' after its adjustment, with as much certainty as the payment of a bank bill.

The next department we were shown is called the Merchants' Room, which occupies part of the north front of this section of the Royal Exchange. It is eighty feet long, and of a proportionate width. Its name sufficiently indicates its purpose—that of affording accommodation to merchants who wish to do business with insurers, which they do through brokers, for they are not always allowed immediate access to the underwriters. Here strangers are admitted, and captains meet the owners of the ships they command—although they have a special room, which we shall presently advert to. The Merchants' Room is placed under the immediate superintendence of a 'master,' who can speak several languages, a qualification essential to a place where people from all maritime nations occasionally meet to transact business, and which could not well be got through without the aid of an interpreter. This apartment is supplied with every newspaper of any note that is published throughout the globe, files of which are kept and preserved. One of the greatest misfortunes attending the burning of the old Royal Exchange, was the destruction of these files, some of which extended back to the earliest era of newspaper publications. Duplicates of 'Lloyd's books' are also kept in this room, the entries in which are made by two clerks, who have also the duty of filing and assorting the numerous journals. The subscription to the Merchants' Room is two guineas per annum, and about five hundred of the most influential firms in the city of London are on the list of subscriptions.

In point of appearance, it equals the Underwriters' Room. Both ceilings are gorgeously though classically wrought, and suspended from each are four or five immense lamps reflecting the Bude light.

The Captains' Room presents a contrast to the other two in every respect. It occupies a rounded corner of the Exchange, and is small and ill-shaped—a kind of coffee-room, where refreshments are served, we believe, to all comers. In it the merchants and owners of vessels meet the captains engaged in their various branches of trade. It is not, however, very largely resorted to, because there are other coffee-rooms frequented for the same purpose. Merchants and captains engaged in commerce with the East Indies, resort to the Jerusalem Coffee-house in Cowper's Court, Cornhill. The Jamaica Coffee-house affords accommodation to the West India shipping trade. In the North and South American, in Throgmorton Street, persons interested in the commerce with the Americas congregate; whilst those engaged in trade with the north of Europe go to 'The Baltic.' Thus the Captains' Room at Lloyd's is extensively superseded. The subscription to it is one guinea a-year.

This completes what may be termed the public part of Lloyd's. To keep it in order, to supply the subscribers with abstracts of the information which arrives by every post, and to keep the accounts, no more than twenty-five persons are employed; a singularly small number, when we compare it with the magnificent notions we imbibe of the power, extent, and importance of Lloyd's, from seeing that name in every newspaper we take up. So well ordered, however, is every arrangement, that this apparently small number of officials is found quite adequate to the demands of the establishment. Sometimes, it is true, they are hard-worked; for the very necessary rule is rigidly enforced, of each day's work being finished on the day on which it arises. By eight o'clock the clerks are at their desks, to receive the letters from the post-office—for Lloyd's letters are delivered before any others. By ten, abstracts, duplicates (written on 'manifold' paper), and entries into the huge books and indices, are expected to be completed. Each post during the rest of the day brings its additional work; and when India mails arrive, the duties are very severe; for though the nominal hour of leaving off is five o'clock, the indefatigable secretary and his clerks and subordinates are obliged to continue their labours far into the night, so that no single stroke of the pen relating to that day shall be left over to the next.

Above the Underwriters' Room are various minor accommodations. The lavatory is on a scale approaching to luxury. The elegant soap-dishes, the spotless napkins, the china basins, the ivory-tipped cocks for the supply of hot and cold water, the lower walls lined with the whitest English porcelain, and the extensive mirrors, present a striking contrast to the washing apparatus of the old London counting-houses. This mostly consisted of a cracked basin and ewer, placed in a dark corner, a jack-towel hung up behind a cupboard-door, under a small looking-glass removable from the nail on which it hung, to be brought out for use to the 'light' as the half-dark spot near the window was called. A room near to the lavatory is a more complete evidence of modern improvement; which is a snug little apartment; on its door is labelled 'Soup Room.' It is elegantly furnished, and its walls are lined with several fine engravings, chiefly portraying shipwrecks—the very last things, one should think, underwriters would choose to be put in mind of.

Opening from the Soup Room is one used for the sitting of the committee of Lloyd's, which consists of a selection of the underwriters, who act as managers of its affairs. On the same floor is a depository for charts, one of the most complete sets of which existing is the property of Lloyd's. Neat and commodious mahogany cases are destined for their reception. To render their usefulness sufficiently extensive, they are open, to be consulted by any person who may apply for that purpose.

With this apartment our survey of Lloyd's was completed—a survey which few could make without being impressed with its vast utility and admirable management. Not a ship can sail but it is noted down at this 'given point.' Upon this small spot rests the commercial intellect, or rather the knowledge, wandering or scattered elsewhere over the globe: here reposes the shipping activity of the world. It is an oracle whereby merchants know when it is the time to send silks, grain, and other commodities to the antipodes: by its mysterious direction the shipowner despatches ship upon ship, and float upon float, with the commodities of his own country, to bring back the needed produce of every nation under heaven.

THE TILE-BURNER AND HIS FAMILY.

BY MRS. CROWE.

In the early part of last century, there lived near the town of Pont de l'Ain, in the south of France, a brick and tile-burner, named Joseph Vallet. Joseph was an industrious man, skilful in his profession, and his bricks and tiles were in great request in the neighbourhood. No man does well in life without exciting the envy and the enmity of mean-spirited persons about him, and Joseph was not exempted from the common fate. He had a few evil wishers, and among these was M. Frillet, who had no other reason for hating Vallet than that he was a rival in trade. Vallet's bricks and tiles commanded a better market than those of Frillet, and that was enough. This hostility of Frillet might have been of little consequence in ordinary circumstances. He possessed, however, the power as well as the inclination to torment his rival; for he was the king's attorney-general for the district, a function which rendered him a dangerous enemy to a poor man.

Some time in 1707, a peasant named Dupler, a neighbour of Vallet's, died in what were alleged to be suspicious

circumstances. He had been seen one night somewhat intoxicated in the company of Vallet, who, it was said, had given him a blow, which led to his illness and death. How this rumour arose no one could tell; but having become public, the attorney-general made a rigorous investigation into the subject. He failed, however, to criminate Vallet in the affair; and it finally appeared that Dupler had died a natural death. Vallet fortunately suffered nothing in character from this attempt to injure him; nobody doubted his innocence. He married, and had a family, and his trade flourished as before.

Nineteen years had elapsed, and the story of Dupler had been long forgotten, when Joseph Sevos and Antoine Pin, two persons of loose character and intemperate habits, disappeared, after having been seen the previous evening—February 19, 1724—in a state of inebriety. They were nowhere to be found; and when a week elapsed without their making their appearance, the question arose, what had become of them?

After some inquiry, it was found that Pin had gone to Dombes and enlisted—a thing he had often threatened to do. But of Sevos there were no traces. This was the more strange, seeing he was in good circumstances, and was the possessor of a small property. Some thought Pin must have made away with his companion; but others combated this idea, under the impression that if Pin had committed murder, he would have fled no one knew whither, instead of enlisting as a soldier.

While public curiosity was on the stretch to discover what had become of Sevos, a rumour was propagated that all was not right with the family of Vallet the tile-burner. It was said they were very much discomposed, as if conscious of having committed a grievous crime. The report spread rapidly through the country, and the attorney-general, Frillet, lost no time in inquiring into the facts. The result of his investigations was, that on the 19th of August 1724 he filed an information to the effect that, 'On Sunday evening, the 19th of February, Joseph Sevos, after eating and drinking in Vallet's house, had suddenly disappeared, and has never since been heard of. That further, according to general belief, he had been murdered in the tiler's house, and buried under the stove; but that afterwards the body had been raised, and consumed in the kiln.'

Upon this information proceedings were commenced by the authorities at Pont de l'Ain, and witnesses summoned. The first person was a man called Vaudan. He averred that, on the night of the 19th of February, having been to Mastalion, he was returning by Vallet's house, about three hours before daylight, when he heard a great noise, and clearly distinguished the words, 'Help! help! I will confess everything! Forgive me this once, and spare my life!' Whereupon a voice, which he knew to be Joseph Vallet's, answered, 'We want no more confessing; you must die!' This sort of dialogue continuing some time, the witness became alarmed; but, anxious to hear the end of it, he hid himself behind a bush, whence he distinctly heard the blows that were given to the victim. Suddenly, however, all became still; and presently afterwards the door of the house opened, and Vallet, accompanied by his wife and two sons, came out, bearing a dead body, which they carried to the brick kiln, and there buried, heaping a quantity of wood over the spot to conceal it. He added, that three or four days afterwards he made a pretext to call on Vallet at the brick kiln, in order to see if he could recognise the place; but, from what he observed, he concluded that the body had been removed; and he had since learned that the murdered person was Joseph Sevos; and that on Good-Friday the Vallets had consumed the body in the furnace.

There were several other witnesses examined; but on close inquiry, it appeared that they had received their information from Vaudan. However, the presumption appeared so strong against the Vallets, that their arrest was decreed, and executed with all the aggravated circumstances that so unnatural a crime seemed to justify. A brigade of mounted police, followed by a mob of the lowest class, proceeded to the tile-burner's house, and, amidst hooting and howling, dragged away the whole family to Pont de l'Ain, and shut them up in prison.

It happened that at this time Vallet was ill. He was suffering from a violent fever, accompanied by ague fits. Nevertheless, he was placed in a miserable dungeon, and loaded with irons; and his wife and sons were exposed to equally harsh and unjustifiable treatment. With not less injustice, his house was given up to pillage; the authorities neither took an inventory of his goods nor set a seal upon them. For eleven days the doors stood open, and the neighbours, quite willing to second the law, helped themselves to what they liked. On the twelfth, it occurred to the attorney-general that the premises should be searched for the clothes of the murdered man; but by this time it was useless to search for anything. The chests were broken open; the clothes, linen, &c. carried away, and doubtless the clothes of Sevos with them. Francisca, Vallet's sister, owned to having removed two bundles of her brother's property, in order to save them from the plunderers; but she declared that nothing belonging to Sevos or any other stranger was in them. She was, however, forced to produce them; and though nothing was found in them but what she had said, she was cast in the costs of the proceedings against herself, and fined twelve livres.

Whilst these things were going on, there was a party who looked on the whole affair with dissatisfaction. They ventured to express doubts of the guilt of the Vallets, and protested against treating them with so much severity; whilst Antoine Pin, who was assuredly not free from suspicion, was allowed to range the world at pleasure. At last the matter got so public, that it reached Paris; it was talked of at court, and furnished a subject for the salons; and as the fine ladies and gentlemen became curious to learn the truth of the business, orders were forwarded to Dombes to arrest Antoine Pin, and send him forthwith to Pont de l'Ain.

No sooner did the fugitive find himself in prison, than he volunteered a full confession. He said that nobody knew better than he the particulars of poor Sevos's murder; and that he was resolved, be the consequences what they might, that he would disclose the whole truth.

'On the evening of the 19th of February,' said he, 'I and Sevos were drinking in Vallet's house, when Sevos took it into his head, being drunk, to reproach Vallet with being the cause of Dupler's death; whereupon, in a rage, Vallet took up a heavy tin can that stood upon the table, and struck Sevos such a blow on the head with it, that he fell backwards to the earth, crying "Mercy, mercy! Take all my money, but spare my life!" But Vallet saying, "Don't talk to me of mercy!" continued to strike him, whilst his wife, with a fire shovel, also lent her assistance. Even Philippe, the eldest boy, joined in the murderous work; and amongst them, they soon put an end to poor Joseph Sevos: young Pierre the while standing sentinel at the door to keep off intruders. Vallet, when he saw that he had killed Sevos, wanted me to strike him too,' continued Pin, 'lest I should be a witness against him; but I would not. When Sevos was dead, they carried him to the kiln, and there buried him, covering the place with a heap of wood; and on Good-Friday they dug up the body and burned it. I know this, because on that day I called at the kiln, and not only smelt the burning, but saw the burnt bones in the furnace. Vallet told me

that if ever I said a word about the matter, he would serve me as he had served Sevos; but, at the same time, I must own he behaved very handsomely to me in the business, paying my silence liberally both with wine and money.'

This testimony chimed in wonderfully with that of Vaudan; and although the dead body was not forthcoming, that circumstance had little weight, when its disappearance was so well accounted for, and when the story was confirmed by the utter impossibility of finding any traces of Joseph Sevos as a living person. The Vallets, however, persisted in denying the whole affair; they declared themselves innocent, and founded their defence on two circumstances. The first was, that, as they asserted, on the day after the disappearance of Sevos, blood was found in his bed, upon his pillow, on the bedclothes, and on the floor of his room, proving decisively that he had been murdered in his own house, and affording a strong presumption that Antoine Pin was the murderer. The second was, that on the night in question Pierre Vallet, who, according to the evidence admitted, had been so useful a coadjutor in the business, had in fact been absent from home, having slept at the house of his schoolmaster at Poncin, in the same bed with two other boys.

Strange to say, the authorities refused to investigate the truth of these allegations. On the contrary, they maintained that, being accused by two persons of the crime, the strongest suspicion attached to Joseph Vallet, and that his guilt was rather aggravated than otherwise by his attempt to shift the load from his own shoulders to those of Antoine Pin—an attempt in which he had entirely failed; and the attorney-general holding, therefore, the crime proved against him, demanded that sentence of death should be passed against the father, whilst confession should be wrung from the mother and sons by the rack. The jurisdiction of Pont de l'Ain, instead of complying with his request, condemned the whole family to the rack; whereupon Frillet, dissatisfied with a decision which gave the tile-burner a chance for his life, appealed to the parliament or high court of Dijon; who forthwith issued an order, transferring the prisoners to their own fortress; whither they were removed, followed by the hootings and execrations of the excited multitude.

It was soon perceived that the authorities of Dijon meant to treat the matter with more earnestness and impartiality than those of Pont de l'Ain had done. They began by admitting the guilt of Vallet and his family, which they considered established beyond a doubt; but they looked upon Antoine Pin as in all probability equally guilty, and therefore to be treated as a criminal, and not as a witness, as had been hitherto the case. They alleged, in support of this opinion, his bad character, his suspicious flight, his avowed presence at the murder, which he not only made no attempt to prevent, but had since concealed; and they also dwelt on certain conditions he had made when he entered the regiment at Dombes, all tending to his own security in case of being pursued. In hopes of eliciting the truth, he was put to the rack; but the torture he endured did not alter his testimony; it only recalled one additional circumstance; namely, that Vallet had given him a louis-d'or to entice Sevos to his house on the day in question.

The fate of the Vallet family seemed now decided; and their case was the more hopeless, that by this last avowal Pin had brought himself under the arm of the law; but now, when least expected, conscience, that irrepressible witness, awoke and spoke for them. No sooner had he returned to his cell, than the thoughts of destroying a whole family by his perjury overpowered him. He passed a night of sleepless anguish, and when the morning dawned, he requested that some person qualified to receive his confession might be sent to him. One of the barristers engaged in the cause was immediately despatched to the prison, and Antoine Pin made the following narration:—

He confessed that his life had been a series of crimes, and that at length, in 1722, he had fallen upon young Philippe Vallet on the high road, and, without being recognised by the boy, had robbed him of his money and clothes. Sevos, however, hidden behind a bush, had witnessed the crime, and had frequently reminded him that he had it in his power to bring him to the scaffold any day he pleased. He had shown no signs of an intention to do it, but nevertheless the threat disturbed Pin, and he never ceased wishing to get rid of so troublesome an acquaintance.

On the 19th February they had gone together to Vallet's house, where they drank and chatted for some time. Sevos, he said, liked idling and drinking as well as he did: they repaired to various wine-houses after leaving Vallet's, in the last of which they sat till past midnight. There it was that, in a state of maudlin intoxication, Sevos pulled a bag out of his pocket, containing about forty dollars in silver, and exhibited the money to Pin, who was immediately seized with a desire to get possession of the booty, and at the same time relieve himself of a dangerous witness, who might turn against him some day when he least expected it. With this view he accompanied Sevos home, and when they got to the door, he represented that although they had drunk a great deal, they had had nothing to eat, and proposed getting something for supper. Sevos said he was hungry too; whereupon Pin went to the house of Michel Morel, whom he knocked up, and from whom he procured a loaf, which he carried back to Sevos's, having on the way slipped into the house of his own father, and armed himself with a hatchet, which he hid under his coat.

Meanwhile Sevos, overcome by liquor, had lost sight of his hunger, and declared his intention of going immediately to sleep, requesting Pin to pass the night with him, to which the latter consented; and just as the unfortunate host was stepping into bed, Pin, who was standing behind him, brought down the hatchet with tremendous force upon his head. 'Oh God! I'm killed!' were the only words that passed the lips of the victim before he sunk to the earth, bathed in his blood. 'After rifling his pockets, I carried the body on my back to the stable,' continued he, 'where I covered it with manure; and then feeling that Bresse was no safe nest for me, I started for Dombes, and enlisted as a soldier.' He added that, before he quitted the house, he tried, without much effect, to efface the traces of his crime. 'This is the truth,' said he, 'and the whole truth. I had neither aiders nor abettors; no one living was in my confidence; and the Vallets, father, mother, and sons, are innocent of the whole affair.'

On being asked why, if this were the case, he had persisted in accusing the Vallets, he answered that his first intention when he was arrested was to confess the truth, but he had changed his mind; adding that Vaudan, the first witness against the Vallets, was a good-for-nothing scoundrel, on whose testimony no reliance whatever could be placed; and that if they secured him, they would learn what weighty reasons he had for giving false evidence.

As Pin persisted in this story, without waiting to investigate the matter further, he was at once condemned, on his own confession, to be broken on the wheel. He fully admitted the justice of his sentence; and the only request he made was, to be permitted to see the Vallets before he died, which being granted, he threw himself at their feet, reiterating his assertions of their innocence, and intreating their pardon. He seemed really penitent; and great as were his crimes, the earnest desire he evinced in the midst of his tortures to vindicate the guiltless and promote the ends of justice, won him the pardon and pity even of the injured Vallets.

Thus died Antoine Pin: and when he was dead, the authorities bethought themselves of searching the stable for the body, and of verifying his story by ascertaining what traces of the crime had been found about the

sum, and I do the same; therefore I wish to take advantage of every opportunity of adding to our earnings. At first I thought to be able to liberate him by taking his place; but my mother (who suspected my plan) assured me that my design was useless; and fearing, not without some reason, that I still might venture, forbade all the captains to take me on board.'

'Have you not heard anything of him since? Do you know whom he serves, and in what way he is treated?' asked the nobleman.

'He is the superintendent of the royal gardens, and is treated humanely. But, alas! this is small comfort for him; he is a slave, and far from all those most dear to him.'

'What is his name and age?

'Robert; and he is nearly fifty-five years of age.'

'You have my best wishes, and certainly are deserving of better fortune. From your good conduct, I think I may promise it to you.'

Night coming on, the nobleman desired him to land him, and, jumping out of the boat, would not allow the youth time to thank him for the purse of money which he left in it as a reward. The young man, surprised at such generosity, for many days sought the nobleman to express his gratitude; but in vain. Two months afterwards, while this poor but honest family were at their scanty dinner, to their utter amazement Robert arrived. A scream of joy and surprise escaped them: they even doubted the reality of their vision. He tenderly embraced each one: 'My wife and my children,' he exclaimed, 'how deeply indebted I am to you; but tell me, how have you been enabled to release me? The sum required for my ransom was enormous: these clothes, and my passage paid beforehand, all astonish me. Alas! to what a state of misery do I see you have reduced yourselves for me.'

The sudden joy quite overpowered his wife, who had not strength to answer, until relieved by a flood of tears. She again embraced her husband, and pointing to her son, said, 'You see in him your liberator; we never could have collected the immense sum required, were it not for his indefatigable exertions, aided by those of a charitable nobleman who was struck by his amiability. To that boy you certainly owe your freedom: he even secretly arranged to exchange with you.'

A shriek from her daughter interrupted her, and on turning round she perceived her son had fainted. The first symptom of returning consciousness was a vacant gaze at his father. Making a vain effort to speak, the poor father was struck dumb by the sudden transition from joy to grief, and turning to his son in an angry manner, he exclaimed, 'Alas! unfortunate youth, what have you done? I cannot feel myself indebted to you for this liberty without shuddering. If my ransom had not caused you to commit some crime, you would not have dared to conceal it from your mother. The son of a miserable slave, and in these wretched times, it is not likely that by honest means you could have procured such assistance. I tremble at the thought of your filial love leading you into crime. Relieve me from this uncertainty; if it is true, I would rather——'

'No, no; compose yourself, father; embrace your son: I am not yet unworthy of that name; for it is neither to me nor one of us that you are indebted. Our benefactor is quite another person. Indeed, mother, it is to that stranger who gave me the purse in such a generous manner that we owe our happiness. Oh, if I could meet him! If I could—— But I will leave no stone unturned to discover him.' He then related to his father how he had met the stranger, and thus eased his mind of all uncertainty.

After two years of useless inquiry, one morning the youth chanced accidentally to meet the object of his search.

'Ah! my lord, my benefactor!' He could say no more, but threw himself at his feet.

'What do you want? What is all this?' said the stranger.

'My lord, do you not know me? Have you forgotten the son of the unfortunate Robert whom you so generously saved?'

'You mistake, my friend; I am a stranger only just arrived.'

'That may be; but do you not recollect being here about two years and a half since? Let me remind you of the few turns you took on the river; the purse that you gave me; the compassion you felt for my father's misfortunes; the numerous questions you asked on whatever could throw light on the means for his liberation. You have thus formed the happiness of an entire family, who desire nothing now but your presence, to heap it with a thousand blessings. Alas! do not deny us our wishes.'

'Softly, my friend; you are too easily deceived; you perhaps——'

'No; I am not deceived; your features are too deeply impressed on my mind ever to forget them. Receive our thanks.' He then seized him by the arm, and tried to induce him to return with him to his home, and witness the happiness which he had been the means of restoring. The contrast between the two attracted a crowd round them. The unknown person was in the height of his glory; but instead of showing his astonishment, he had the courage to repress it, and still to remain in concealment.

This fact would have remained for ever a mystery, if, on the death of a Marseilles merchant, his relations had not found among his papers a note for 7500 francs, 'sent to Robert Meryn à Cadice,' and for which there was no receipt. A famous English banker said he had made use of this money, by the orders of Signor Charles, second Baron de Montesquieu, president of the parliament of Bourdeaux, for the ransom of an inhabitant of Marseilles, called Robert, enslaved at Tetuan. This celebrated man was in the habit of occasionally visiting his sister, Madame d'Hericourt, who was married at Marseilles.

The generous action which he performed, and which we have now related, does not merit less commendation than his literary labours, by which he has rendered his name immortal.

DUNCES.

We find the following humorous and judicious remarks on this ill-understood class of school-boys, in a speech delivered by Mr Macintosh, at a late meeting of the Forfar, Fife, and Perthshire Educational Association:—

We all know what great bores dunces are in schools, and how readily the master's choler is awakened by their laggard motions. They, however, often serve a purpose. Without dunces, our classes would not present the striking contrast which they often exhibit; the dunces are the dark shades in the picture, which throw the talented youth more prominently into view. They, moreover, offer an opportune occasion for the wit, the sapient counsel, and thundering reproof of the master; and should he enforce his argument by 'suiting the action to the word'—

> 'Full well the boding tremblers learned to trace
> The day's disasters in his morning face;
> Full well the busy circle, whispering round,
> Conveyed the dismal tidings when he frowned.'

Though the days of indiscriminate castigation are gone by, and dunces enjoy an exemption formerly unknown under the reign of terror, they are not yet treated with the rational consideration, and consequently with that *justice*, which their circumstances demand. Let us analyse the character of a dunce as he is too often impersonated. There are several species of dunces. There is first the *incapable*, to whom nature has been niggard in the power of observation, discrimination, reflection, and memory. An unfortunate of this class is sent to school, and yoked with class-fellows of his own age. His natural imperfections speedily appear; he falls astern at a fearful rate; he soon becomes powerless in contending with his gifted compeers, who look on him with indifference and contempt. He then becomes a dead weight on his class,

and provokes, too often, the ire of his master to punish him for what he is incompetent to perform. What consequences follow? The natural incapables are often quiet and patient, and very passive under discouragements and disgrace; they *feel* their case to be hopeless, and despairingly resign themselves to their fate.

Another section of dunces stand nearly on a level with the natural incapables with respect to scholastic progress, because they have not been trained to habits of attention, observation, application, order, and obedience. They have been spoiled by too much indulgence; or, it may be, have been entirely uncared for, and left to the government of their appetites and passions, a prey to the depraved propensities of human nature. At school they are the *moral* incapables. Though seen at the fag-end of a class, careless, unprepared, and unashamed, they are never at the fag-end of play and mischief; in fact, idleness and mischief are their element. As far as my experience goes, the *natural* incapables are not a numerous class, which is one of the many evidences of the beneficence of the Creator. But the *moral* incapables include a much larger proportion, which proves the lamentable irregularities in domestic training.

There is a third class of an intermediate character—*reputed* dunces—but falsely so called, who possess a delicate physical organisation, and a most sensitive mental constitution, whose faculties are paralysed by anxiety and fear, who tremble at the slightest difficulty, and sink under the slightest discouragement. They resemble those beautiful plants that bloom in the genial atmosphere of a greenhouse, but are blasted on being exposed to the mercy of the elements. Above a dozen years ago a case of this kind fell under my observation. The boy to whom I allude had the most sensitive feelings I ever knew. I was made aware of his very susceptible mental temperament, and treated him with kindness and care. The youth had excellent parts, and made satisfactory progress. Without reflecting on the probable consequences, his father placed him under the care of a master to learn a foreign language; the nerves of the poor youth were unequal to the excitement of competition—he fevered and died. There was no blame attachable to his teacher. The poor youth was too sensitive for the region of competition, unfit to struggle with robust and hardy boys. As we are to take an interest in dunces generally, or those who are reputed dunces, would it not be well, if we who are professional men, would carefully set ourselves to consider whether it is not possible to devise a more rational mode of treating these different classes? It is true we may be goaded and annoyed by ignorant parents, who expect all children to make equal progress. But there are considerations superior to temporary gain, of which we ought never to lose sight. Why does a skilful physician so carefully study the diagnostics of any disease as it may be exhibited in the cases of his patients? He does so to meet the case fairly, to maintain his professional skill and credit; and he is actuated by the higher motives of humanity and kindness. These principles and feelings should induce us to rise superior to temporary advantage, to be above the influence of unreasonable and ignorant parents, to study our profession, and make our duty the pole star to which our exertions should be directed. We will thereby be benefactors of our species, we will rise in our respective spheres, and we will enhance our profession in the estimation of society. Do not these reflections suggest that the classification of children labouring under natural and moral disqualifications is unadvisable and absurd? Is it not treating them cruelly and unjustly, to place them among competitors with whom they have no chance of success? What opinion would we entertain of a proposal to match cripples in a race with youths of sound limbs and strong sinews? It is impossible to calculate the extent of injury, physical and mental, thus inflicted. In the treatment of unfortunates—misnamed dunces—parents unhappily reverse the maxims they scrupulously adopt with the health of enervated and sickly children. A poor youth who cannot move beyond the speed of a tortoise, being encouraged for doing all that he is able to do, will exert his small energies to the utmost, and take a pleasure in his labour, when he is not taxed beyond his ability. What is it that renders the labour of a teacher so irksome, but the false position in which he is placed by such unnatural arrangements? Who can tell how many intellects have been marred by unskilful treatment? The error of the modern and improved system of education, is the enormous speed with which the youthful travellers are hurried forwards. We cannot make plants and trees grow faster than Nature intends, consistently with their health and vigour.

It is well known that precocious talents in youth disappear in manhood; like those beautiful but evanescent flowers which spring puts forth, and which perish in spring. A remarkable case of this sort is recorded in the fifth volume of the Journal of Education of the Society for the Diffusion of Useful Knowledge:—'We allude to Von Shonach's Memoir of Christian Henry Heinnecken, who was born at Lubeck on 6th February 1721, and died 27th June 1725. His life, therefore, did not reach beyond the brief span of four years and nearly five months; yet within so short a career as this, the child exhibited such marvellous proofs of intellect and memory, that we should be tempted to doubt their possibility altogether, were not every incident corroborated by the testimony of parties of the very highest respectability. At the age of ten months young Heinnecken began to speak; it was whilst he was looking at some prints, which he wished to have explained to him. Whilst the explanation was giving, it was casually observed that the child watched the motions of the speaker's lips with a singular degree of earnestness; and then, though not without great exertion, he succeeded in repeating what had been said syllable by syllable. From that day forward his progress was most extraordinary: at the age of one year he was conversant with all the leading events in the five books of Moses; at thirteen months he had mastered the history of the Old Testament; and at fourteen the history of the New. By the month of September 1723, he had acquired so perfect a knowledge of ancient and modern history, as well as geography, that he could answer any question put to him, on circumstances connected with either of them, without a blunder. He now stored his memory with a host of Latin words; and in a short time was able to express himself with tolerable fluency in the language. No great time elapsed before he mastered French: and ere he had reached his third year he made himself thoroughly acquainted with the genealogies of the principal families in Europe. A considerable portion of his fourth year was consumed in travelling through Denmark, where his rare precocity was a theme of admiration with the whole court, amongst whom were the king and his son; and with them he entered into conversation, without betraying the slightest shyness. On his return to Lubeck he learned to write, which with him was the operation of a few days: but his brief and meteor-like course was on the wane; he gradually declined, and became worse as month succeeded month; and was at length released from his sufferings. His fragile frame of body exhibited a remarkable contrast with the unprecedented strength of his mind; and strong, indeed, it must have been to have withstood the ravages of frequent and severe indisposition. Nor is it less remarkable, that the child was not weaned from his nurse until a few months before his death; for he had a violent antipathy against every species of nourishment but milk.'

Who can imagine that the life of this learned infant was not sacrificed to the vanity and mismanagement of his inconsiderate parents? If, by a more rational treatment, the *health* of this child had been the chief solicitude of his parents, and his life had been prolonged, his story would be less marvellous indeed; but he might have benefited society by the matured development of his rare endowments. The same false estimate of talents is not unfrequently seen in the angry and disappointed feelings of parents exhibited at public examinations. 'Why is my son not dux?' mutters a father, as he sees his son half-way down a class. He does not reflect that there can be only one dux at a time; and that a youth lower in station may carry away as much solid and useful learning as the highest scholar in the class. About sixty years ago, there were at the parish school of St Andrews two youths, who showed so little aptitude to learn, and who annoyed and irritated their master so much, that he dismissed them from school as incorrigible dunces. The boys were Thomas Chalmers and George Cook.* Will posterity award the unenviable honour of dunce to Dr Chalmers and Dr Cook, or to their teacher? When Sir Isaac Newton first went to school, he was a weakly child and a reputed dunce. Sir D. Brewster, in his Life of Newton, informs us that the dormant energies

* Dr George Cook died in 1845, Professor of Moral Philosophy in the University of St Andrews. He was author of two historical works, and for several years led one of the parties of the Scottish Church.

of the embryo philosopher were aroused into activity by one of his class-fellows giving him a violent blow in the stomach for sluggishness and inattention to his lessons. Newton determined to be revenged, and applied to his task with such diligence and success, that he speedily distanced his competitors. Instances of a similar kind might be plentifully gleaned from the biographies of eminent men, who in childhood were reputed dunces. Enough has been said to show that dunces are worthy of our special attention. Will my professional friends excuse me for suggesting that the offensive name Dunce should be discontinued? If we must mark this *status*, let us employ a more appropriate and scholastic epithet. I propose then to erase Dunce, and substitute *Under-graduate*.

MINUTENESS OF ANIMAL LIFE.

Take any drop of water from the stagnant pools around us, from our rivers, from our lakes, or from the vast ocean itself, and place it under your microscope; you will find therein countless living beings, moving in all directions with considerable swiftness, apparently gifted with sagacity, for they readily elude each other in the active dance they keep up; and since they never come into rude contact, obviously exercise volition and sensation in guiding their movements. Increase the power of your glasses, and you will soon perceive, inhabiting the same drop, other animals, compared to which the former were elephantine in their dimensions, equally vivacious and equally gifted. Exhaust the art of the optician, strain your eye to the utmost, until the aching sense refuses to perceive the little quivering movement that indicates the presence of life, and you will find that you have not exhausted nature in the descending scale. Perfect as our optical instruments now are, we need not be long in convincing ourselves that there are animals around us so small that, in all probability, human perseverance will fail in enabling us accurately to detect their forms, much less fully to understand their organisation! Vain, indeed, would it be to attempt by words to give anything like a definite notion of the minuteness of some of these multitudinous races. Let me ask the reader to divide an inch into 22,000 parts, and appreciate mentally the value of each division: having done so, and not till then, shall we have a standard sufficiently minute to enable us to measure microscopic beings. Neither is it easy to give the student of nature, who has not accurately investigated the subject for himself, adequate conceptions relative to the numbers in which the infusoria sometimes crowd the waters they frequent; but let him take his microscope, and the means of making a rough estimate at least are easily at his disposal. He will soon perceive that the animalcule inhabitants of a drop of putrid water, possessing, as many of them do, dimensions not larger than the 1·2000th part of a line, swim so close together, that the intervals separating them are not greater than their own bodies. The matter, therefore, becomes a question for arithmetic to solve, and we will pause to make the calculation. The *Monas termo*, for example—a creature that might be pardonably regarded as an embodiment of the mathematical point, almost literally without either length, or breadth, or thickness—has been calculated to measure about the 22,000th part of an inch in its transverse diameter; and in water taken from the surface of many patrid infusions, they are crowded as closely as we have stated above. We may therefore safely say, that, swimming at ordinary distances apart, 10,000 of them would be contained in a linear space one inch in length, and consequently a cubic inch of such water will thus contain more living and active organised beings than there are human inhabitants upon the whole surface of this globe!—*Rymer Jones*.

INFLUENCE OF PATERNAL FAME.

The son of a celebrated man enters upon his career crushed rather than supported by the name which he bears. His earliest efforts, which would be judged of with indulgence if they proceeded from a new man, are found unworthy of the brilliant renown of the name under which they are brought forward. Like a planet which is too near the sun, he cannot sufficiently divest himself of the rays of the paternal glory, to shine by his own light; he is discouraged, and too often contents himself with the borrowed splendour he derives from this source.—*Professor Macaire*.

'HATEFUL SPRING!'

[FROM THE 'CHANSONS' OF BERANGER.]

All the winter, from my window,
Have I watched a damsel fair;
Loving, though we both were strangers,
Sending kisses through the air.
Gazing through her leafless lattice,
Every day did pleasure bring:
Now green boughs the lattice shadow—
Why return'st thou, hateful spring?

In that thick and verdant cover
The sweet graceful form is lost
Which I daily saw there, throwing
Food to poor birds through the frost;
Those dear warblers were the signal
Of our love's awakening:
Snow of all things is most lovely—
Why return'st thou, hateful spring?

But for thee I still might see her
Rising fresh from sweet repose,
Rosy, as when young Aurora
Dawn's gray curtains does unclose;
And I still might say at even,
When her lamp is vanishing,
'Now my star has set—she slumbers'—
Why return'st thou, hateful spring?

How my fond heart prays for winter!
How I long to hear again
Sleet and hailstones lightly beating
Music on the window pane.
Flowers and zephyrs, summer evenings,
Unto me no joy can bring,
Since I see my love no longer—
Why return'st thou, hateful spring?

D. M. M.

ECONOMY IN KNOWLEDGE.

Old-fashioned economists will tell you never to pass an old nail, or an old horse-shoe, or buckle, or even a pin, without taking it up; because although you may not want it now, you will find a use for it some time or other. I say the same thing to you with regard to knowledge. However useless it may appear to you at the moment, seize upon all that is fairly within your reach; for there is not a fact within the whole circle of human observation, nor even a fugitive anecdote that you read in a newspaper or hear in conversation, that will not come in play some time or other: and occasions will arise when they will, involuntarily, present their dim shadows in the train of your thinking and reasoning, as belonging to that train, and you will regret that you cannot recall them more distinctly.—*William Wirt*.

PECULIARITY OF TALENT.

Every system of teaching must be defective which has no reference to the characteristic talent of the scholar, who, though he may be a dunse in classics, and slow of recollection, may possess a turn of mind which will one day lead him to great discoveries, and rank its possessor amongst the most eminent of mankind. Supposing Newton had neglected those pursuits for which he was so fitted, and had applied himself to poetry; instead of developing the law of gravitation, elucidating Optics, and composing the Principia, he might have been the writer of rhymes and verses unfit even for the public eye. He would have been acting in opposition to nature, and, not perceiving the source of his strength, might have exhausted his diligence ineffectually. Let your studies, then, be in relation to the mind, unless you would prefer irksome toil to pleasant labour, a scanty produce to a teeming harvest. Many are the instances of men of genius persisting in their favourite occupation, in spite of the opposition and censures of their friends: and they were right, for they well knew the seat of their power, and saw what no one could see besides them. The father of Pascal denied him Euclid, but he could not prevent him being a mathematician.—*W. F. Barlow*.

LLOYD'S.

The greater number of persons must have heard of 'Lloyd's,' but comparatively few, we believe, are aware of the precise meaning of the term. 'Lloyd's' is an institution nestling in the heart of London, and finding accommodation in certain apartments in the north and east sides of the Royal Exchange. In these apartments the greater part of the business of the entire mercantile navy of Great Britain is transacted. Lloyd's is known everywhere; for there is not a newspaper published in any part of the globe but has some allusion to it. It is a focus in which is collected every noticeable event concerning every ship that sails from British, and occasionally from continental ports. The establishment consists of a fraternity of ship-assurers, technically, 'underwriters;' in other words, subscribers to bonds which they enter into, to insure the proprietors of ships and freights from losses at sea.

A visit to this nucleus of shipping business and shipping news is full of interest. It is a spot whence branch out chains of communication to the 'uttermost ends of the earth.' Wherever civilisation has once set her foot, there some direct or indirect agent is ready to take note of any ship that may appear in sight, and to give help to any which may need it; and by his reports such circumstances, be they ever so trifling, find their way in due time to Lloyd's. But besides the abstract interest the place excites, the eye is filled with the grandeur and architectural beauty of the apartments; and nowhere are the sweeping changes to which the city of London is subject—now more perhaps than at any former period—so apparent as at Lloyd's. Formerly, one of the wonderments created in the eyes of visiting provincials, was the disproportion existing between the vastness of the operations of the mercantile world, and the mean, petty, and inconvenient places in which these were carried on. In dark, dingy, and scarcely wholesome chambers, millions of money changed hands, and transactions were completed the effects of which were sometimes felt by whole nations. Now, however, metropolitan improvement has changed those confined offices for others more worthy of the importance of the business transacted in them. The history of Lloyd's exemplifies the progress of this kind of change very aptly.

The man who gave his name to this great system of sea-insurance and maritime intelligence was a humble individual, the keeper of a coffee-house in Lombard Street; and here the underwriters used to assemble, as a convenient spot near the Royal Exchange, the centre of British commerce. At what period Lloyd died is unknown, and little can be told regarding him. Allusion is made to his coffee-house as a place for auctions, in a poem entitled *The Wealthy Shopkeeper*, published in 1700—

> 'Then to Lloyd's coffee-house he never fails,
> To read the letters, and attend the sales.'

In 1710, Sir Richard Steele dates from it (Tatler, No. 246) his Petition on Coffee-house Orators and Newsvenders: Addison also, in the Spectator for 23d April 1711, makes Lloyd's Coffee-house the scene where one of his papers of minutes was dropped, and the boy was ordered by the merry gentleman there to get up into the auction pulpit and read it to the whole room. The auction business then transacted at Lloyd's is now transferred to Garraway's Coffee-house. We know little more of the early history of the former, besides the fact, that the underwriters seem to have frequented it from a still earlier period. Their 'list' for June 7, 1745, a copy of which is still extant, is No. 996, and as it had hitherto been published once a-week, we may suppose the publication to have then been about eighteen years established. It would seem that the merchants meeting at Lloyd's had in time found their accommodation there inadequate, for on the 13th December 1771, there is an agreement, signed by seventy-nine underwriters, to pay L.100 each, in order to obtain a lease of two houses in Freeman's Court, Cornhill; and this arrangement not being effected, they actually took a lease of the British Herring Company's offices in the Royal Exchange, where, with subsequent additions, they remained till the whole building was destroyed by fire a few years ago. It was only for a time that the members of Lloyd's were driven from this well-known resort. On the renovation of the Exchange buildings, they took possession of handsome and commodious new premises; and it is these which, with this scanty historical information, we are now prepared to enter.

Proceeding to the north end of the eastern outer portico of the Royal Exchange, progress is stayed by two large glazed doors, which, yielding to a slight pressure, open at the foot of a handsome flight of stairs. Each step is formed of a single stone, fourteen feet long, brought from the Craigleith quarries near Edinburgh. At the top of this noble staircase you enter a spacious hall, whence ingress to the different departments is obtained.

The first room into which we were shown is a comparatively small one. Around the walls are reading desks, breast high, one of which occupies the middle of the room. Half way between the ceiling and the floor is a gallery, like that of a library, used for consulting the rollers of maps with which the walls are lined. This may perhaps be regarded as the most important room in the house, and is certainly the most exciting one to the parties concerned. It contains a number of indices, by means of which the registers of haps and mishaps, as they are daily reported, may be readily

consulted. When we entered, several persons were turning them over, and tracing, with careful finger, the columns in search of the name of the ship in which they were interested. Having been referred to the proper spot on one of the pages of two enormous ledgers, called 'Lloyd's books,' they there obtain the information they seek. If their ship has been merely met on the high seas by another, or 'spoken with,' or has touched or arrived at a particular port, the news is entered against the name of the ship in ordinary characters; but if any accident has happened—a wreck, a fire, a severe collision—it is recorded in large characters, occupying two lines; hence the technical phrase applied to such casualties—'double lines.' The moment the doors of the establishment are opened (at ten o'clock in the morning), there is a crowd of persons ready to rush to these ominous books, especially when the weather has been stormy; and many an insurer leaves them with the knowledge that he is by many thousands poorer than he had reason to expect before consulting them.

This apartment may be regarded as a small section of the larger and more important underwriters' room—as noble a place of business as exists anywhere. It is one hundred feet long and forty-eight feet wide; the roof, which is beautifully ornamented, is supported by two rows of scagliola columns. It is fitted up with mahogany tables and seats for the accommodation of the subscribers. These are of two classes: first, 'underwriters,' who are the actual insurers of ships; and second, insurance brokers. In all commercial transactions of a large and complicated kind, the broker, or middle-man, is indispensable. A merchant who wishes to insure a particular sort of goods going by sea, could not effect the transaction at once with an underwriter, from his not knowing the exact man whose connexions lie in his particular branch of commerce, or who is willing to purchase the risk. While he is hunting for such a person, his goods may have been shipped, and perhaps sunk to the bottom of the sea. But the broker obviates this. He is ready to deal both with insurers and insured at all times, and makes his profit by contracting for the risk from the latter, at a trifle higher rate than he effects it with the former. By his agency, in short, an open market is always kept, and in this respect no broker is so useful as the insurance broker.

It is not possible to conceive a more exciting life than that of the underwriter. A sudden change of weather, or the non-arrival of a ship at the time she is expected or is 'due,' sinks him from the highest hopes of profit down to the deepest dread of loss. Some branches of the business approach the verge of gambling; at all events, the risks of marine insurance are much less easily reckoned, and are of a far less precise kind, than those of life or fire insurance. Yet wonderful efforts are made to give it certainty: the age and soundness of the ship, the kind of cargo with which she is laden, the part of the world to which she is going, the time of year, and even the skill and character of the captain who commands her, are elements in the calculation. Sometimes insurances are increased, or new ones effected, while the ship is at sea: when she has not been met with by other vessels reported to have crossed her track, or when she has delayed her arrival into home-port, the rate is augmented, according as the chance of some accident is great. The steam-ship 'President,' which went down a few years ago, and has never since been heard of, was 'done,' or, in other words, risks were taken on her in the Underwriters' Room, at a very high premium, up to the latest minute of hope. Underwriters are found who do not object to speculate on the safety of ships in equally desperate circumstances, or, to use their own slang, 'to take a few thousands on them at a very long price;' and vast sums of money are daily won and lost in this way. This *is* gambling.

To assist the underwriters in their calculations, not only the earliest and most ample news of actual events is provided, but every means which science can suggest is employed to guide them as to probabilities. At the end of their room is a machine called an Anemometer, which registers the state of the wind during every hour of the day and night. Thus, when a subscriber arrives in the morning, he can see which way the wind has blown during any hour he has been asleep, and how hard it has been blowing, over and past the Royal Exchange. From data thus obtained, he can make his calculations respecting any other part of Europe in which the craft he may be interested in is floating; for a more weather-wise body than underwriters and insurance brokers does not exist. This ingenious and accurate instrument merits some notice in passing.

On the top of the Royal Exchange may be seen a sort of mast, at the top of which is a fan, precisely like that attached to a modern windmill, the object of which is to keep a plate of metal with its face presented to the wind. Attached to this plate are springs, which, joined to a rod, descend into the Underwriters' Room upon a large sheet of paper placed against the wall. To this end of the rod a lead pencil is attached, which slowly traverses the paper horizontally, by means of clock-work. When the wind blows very hard against the plate outside, the spring, being pressed, pushes down the rod, and the consequence is, that the pencil makes a long line down the paper vertically, which denotes a high wind. At the bottom of the sheet another pencil moves, guided by a vane on the outside, which so directs its course horizontally, that the direction of the wind is shown. The sheet of paper is divided into squares, numbered with the hours of night and day, and the clock-work so moves the pencils, that they take exactly an hour to traverse each square; hence the strength and direction of the wind at any hour of the twenty-four is easily seen. Attached to this machine is also a rain-gauge. By consulting it, therefore, the underwriter collects some facts which guide him in his operations during each hour of his business-day.

The number of subscribers to the Underwriters' Room has been estimated at from one thousand to eleven hundred. They include three descriptions of persons:—1st, Those who insure at their own risk, and with their own capital; 2d, Those who represent, at a salary, the various marine assurance companies: each of these classes pays twenty-five pounds as an entrance-fee, besides an annual subscription of four guineas; 3d, Brokers, who pay the yearly four guineas only. The sums thus collected and accumulated make the establishment exceedingly rich. As some proof of its wealth and liberality, we may mention that, when Napoleon threatened an invasion, Lloyd's opened a subscription, upon an extensive plan, for the encouragement and reward of sufferers, and the relief of their widows and orphans. They commenced themselves the subscription nobly, transferring to it the sum of L.20,000, 3 per cent. consols, under the name of the 'Patriotic Fund,' which subsequently amounted to L.700,000. During its progress, Lloyd's added to their former subscription, in 1809, L.5000, and in 1813, L.10,000; thus making L.35,000 in all. They have also contributed munificently to other public funds: for instance, L.5000 to the London Hospital, for the admission of seamen employed in the commerce of London; L.1000 for the suffering inhabitants of Russia in the year 1813; L.1000 for the relief of the militia in our North American colonies, 1813; L.10,000 for the Waterloo subscription in 1815; and L.2000 for the establishment of lifeboats on the coast. They have also done, and are annually doing, much for the relief of private distress occasioned by disasters at sea; and, waiving all considerations of political power, which they do not aspire to, are almost as efficient as the Foreign Office itself in defending our seamen from the abuse of distant and less civilised powers. The committee also vote medals and rewards to those who distinguish themselves in saving life from shipwreck.

The regularity and punctuality with which the subscribers to Lloyd's pay their losses is proverbial. So soon as the various documents required to substantiate

a loss are presented to the underwriter, the loss is, as they express it, 'written off;' that is, adjusted; and one month after, the amount is paid. Such is the regularity with which these payments are made at Lloyd's, that a merchant can calculate on receiving the amount of a loss 'one month' after its adjustment, with as much certainty as the payment of a bank bill.

The next department we were shown is called the Merchants' Room, which occupies part of the north front of this section of the Royal Exchange. It is eighty feet long, and of a proportionate width. Its name sufficiently indicates its purpose—that of affording accommodation to merchants who wish to do business with insurers, which they do through brokers, for they are not always allowed immediate access to the underwriters. Here strangers are admitted, and captains meet the owners of the ships they command—although they have a special room, which we shall presently advert to. The Merchants' Room is placed under the immediate superintendence of a 'master,' who can speak several languages, a qualification essential to a place where people from all maritime nations occasionally meet to transact business, and which could not well be got through without the aid of an interpreter. This apartment is supplied with every newspaper of any note that is published throughout the globe, files of which are kept and preserved. One of the greatest misfortunes attending the burning of the old Royal Exchange, was the destruction of these files, some of which extended back to the earliest era of newspaper publications. Duplicates of 'Lloyd's books' are also kept in this room, the entries in which are made by two clerks, who have also the duty of filing and assorting the numerous journals. The subscription to the Merchants' Room is two guineas per annum, and about five hundred of the most influential firms in the city of London are on the list of subscriptions.

In point of appearance, it equals the Underwriters' Room. Both ceilings are gorgeously though classically wrought, and suspended from each are four or five immense lamps reflecting the Bude light.

The Captains' Room presents a contrast to the other two in every respect. It occupies a rounded corner of the Exchange, and is small and ill-shaped—a kind of coffee-room, where refreshments are served, we believe, to all comers. In it the merchants and owners of vessels meet the captains engaged in their various branches of trade. It is not, however, very largely resorted to, because there are other coffee-rooms frequented for the same purpose. Merchants and captains engaged in commerce with the East Indies, resort to the Jerusalem Coffee-house in Cowper's Court, Cornhill. The Jamaica Coffee-house affords accommodation to the West India shipping trade. In the North and South American, in Throgmorton Street, persons interested in the commerce with the Americas congregate; whilst those engaged in trade with the north of Europe go to 'The Baltic.' Thus the Captains' Room at Lloyd's is extensively superseded. The subscription to it is one guinea a-year.

This completes what may be termed the public part of Lloyd's. To keep it in order, to supply the subscribers with abstracts of the information which arrives by every post, and to keep the accounts, no more than twenty-five persons are employed; a singularly small number, when we compare it with the magnificent notions we imbibe of the power, extent, and importance of Lloyd's, from seeing that name in every newspaper we take up. So well ordered, however, is every arrangement, that this apparently small number of officials is found quite adequate to the demands of the establishment. Sometimes, it is true, they are hard-worked; for the very necessary rule is rigidly enforced, of each day's work being finished on the day on which it arises. By eight o'clock the clerks are at their desks, to receive the letters from the post-office—for Lloyd's letters are delivered before any others. By ten, abstracts, duplicates (written on 'manifold' paper), and entries into the huge books and indices, are expected to be completed. Each post during the rest of the day brings its additional work; and when India mails arrive, the duties are very severe; for though the nominal hour of leaving off is five o'clock, the indefatigable secretary and his clerks and subordinates are obliged to continue their labours far into the night, so that no single stroke of the pen relating to that day shall be left over to the next.

Above the Underwriters' Room are various minor accommodations. The lavatory is on a scale approaching to luxury. The elegant soap-dishes, the spotless napkins, the china basins, the ivory-tipped cocks for the supply of hot and cold water, the lower walls lined with the whitest English porcelain, and the extensive mirrors, present a striking contrast to the washing apparatus of the old London counting-houses. This mostly consisted of a cracked basin and ewer, placed in a dark corner, a jack-towel hung up behind a cupboard-door, under a small looking-glass removable from the nail on which it hung, to be brought out for use to the 'light' as the half-dark spot near the window was called. A room near to the lavatory is a more complete evidence of modern improvement; which is a snug little apartment; on its door is labelled 'Soup Room.' It is elegantly furnished, and its walls are lined with several fine engravings, chiefly portraying shipwrecks—the very last things, one should think, underwriters would choose to be put in mind of.

Opening from the Soup Room is one used for the sitting of the committee of Lloyd's, which consists of a selection of the underwriters, who act as managers of its affairs. On the same floor is a depository for charts, one of the most complete sets of which existing is the property of Lloyd's. Neat and commodious mahogany cases are destined for their reception. To render their usefulness sufficiently extensive, they are open, to be consulted by any person who may apply for that purpose.

With this apartment our survey of Lloyd's was completed—a survey which few could make without being impressed with its vast utility and admirable management. Not a ship can sail but it is noted down at this 'given point.' Upon this small spot rests the commercial intellect, or rather the knowledge, wandering or scattered elsewhere over the globe: here reposes the shipping activity of the world. It is an oracle whereby merchants know when it is the time to send silks, grain, and other commodities to the antipodes: by its mysterious direction the shipowner despatches ship upon ship, and float upon float, with the commodities of his own country, to bring back the needed produce of every nation under heaven.

THE TILE-BURNER AND HIS FAMILY.

BY MRS. CROWE.

In the early part of last century, there lived near the town of Pont de l'Ain, in the south of France, a brick and tile-burner, named Joseph Vallet. Joseph was an industrious man, skilful in his profession, and his bricks and tiles were in great request in the neighbourhood. No man does well in life without exciting the envy and the enmity of mean-spirited persons about him, and Joseph was not exempted from the common fate. He had a few evil wishers, and among these was M. Frillet, who had no other reason for hating Vallet than that he was a rival in trade. Vallet's bricks and tiles commanded a better market than those of Frillet, and that was enough. This hostility of Frillet might have been of little consequence in ordinary circumstances. He possessed, however, the power as well as the inclination to torment his rival; for he was the king's attorney-general for the district, a function which rendered him a dangerous enemy to a poor man.

Some time in 1707, a peasant named Dupler, a neighbour of Vallet's, died in what were alleged to be suspicious

circumstances. He had been seen one night somewhat intoxicated in the company of Vallet, who, it was said, had given him a blow, which led to his illness and death. How this rumour arose no one could tell; but having become public, the attorney-general made a rigorous investigation into the subject. He failed, however, to criminate Vallet in the affair; and it finally appeared that Dupler had died a natural death. Vallet fortunately suffered nothing in character from this attempt to injure him; nobody doubted his innocence. He married, and had a family, and his trade flourished as before.

Nineteen years had elapsed, and the story of Dupler had been long forgotten, when Joseph Sevos and Antoine Pin, two persons of loose character and intemperate habits, disappeared, after having been seen the previous evening—February 19, 1724—in a state of inebriety. They were nowhere to be found; and when a week elapsed without their making their appearance, the question arose, what had become of them?

After some inquiry, it was found that Pin had gone to Dombes and enlisted—a thing he had often threatened to do. But of Sevos there were no traces. This was the more strange, seeing he was in good circumstances, and was the possessor of a small property. Some thought Pin must have made away with his companion; but others combated this idea, under the impression that if Pin had committed murder, he would have fled no one knew whither, instead of enlisting as a soldier.

While public curiosity was on the stretch to discover what had become of Sevos, a rumour was propagated that all was not right with the family of Vallet the tile-burner. It was said they were very much discomposed, as if conscious of having committed a grievous crime. The report spread rapidly through the country, and the attorney-general, Frillet, lost no time in inquiring into the facts. The result of his investigations was, that on the 19th of August 1724 he filed an information to the effect that, 'On Sunday evening, the 19th of February, Joseph Sevos, after eating and drinking in Vallet's house, had suddenly disappeared, and has never since been heard of. That further, according to general belief, he had been murdered in the tiler's house, and buried under the stove; but that afterwards the body had been raised, and consumed in the kiln.'

Upon this information proceedings were commenced by the authorities at Pont de l'Ain, and witnesses summoned. The first person was a man called Vaudan. He averred that, on the night of the 19th of February, having been to Mastalion, he was returning by Vallet's house, about three hours before daylight, when he heard a great noise, and clearly distinguished the words, 'Help! help! I will confess everything! Forgive me this once, and spare my life!' Whereupon a voice, which he knew to be Joseph Vallet's, answered, 'We want no more confessing; you must die!' This sort of dialogue continuing some time, the witness became alarmed; but, anxious to hear the end of it, he hid himself behind a bush, whence he distinctly heard the blows that were given to the victim. Suddenly, however, all became still; and presently afterwards the door of the house opened, and Vallet, accompanied by his wife and two sons, came out, bearing a dead body, which they carried to the brick kiln, and there buried, heaping a quantity of wood over the spot to conceal it. He added, that three or four days afterwards he made a pretext to call on Vallet at the brick kiln, in order to see if he could recognise the place; but, from what he observed, he concluded that the body had been removed; and he had since learned that the murdered person was Joseph Sevos; and that on Good-Friday the Vallets had consumed the body in the furnace.

There were several other witnesses examined; but on close inquiry, it appeared that they had received their information from Vaudan. However, the presumption appeared so strong against the Vallets, that their arrest was decreed, and executed with all the aggravated circumstances that so unnatural a crime seemed to justify. A brigade of mounted police, followed by a mob of the lowest class, proceeded to the tile-burner's house, and, amidst hooting and howling, dragged away the whole family to Pont de l'Ain, and shut them up in prison.

It happened that at this time Vallet was ill. He was suffering from a violent fever, accompanied by ague fits. Nevertheless, he was placed in a miserable dungeon, and loaded with irons; and his wife and sons were exposed to equally harsh and unjustifiable treatment. With not less injustice, his house was given up to pillage; the authorities neither took an inventory of his goods nor set a seal upon them. For eleven days the doors stood open, and the neighbours, quite willing to second the law, helped themselves to what they liked. On the twelfth, it occurred to the attorney-general that the premises should be searched for the clothes of the murdered man; but by this time it was useless to search for anything. The chests were broken open; the clothes, linen, &c. carried away, and doubtless the clothes of Sevos with them. Francisca, Vallet's sister, owned to having removed two bundles of her brother's property, in order to save them from the plunderers; but she declared that nothing belonging to Sevos or any other stranger was in them. She was, however, forced to produce them; and though nothing was found in them but what she had said, she was cast in the costs of the proceedings against herself, and fined twelve livres.

Whilst these things were going on, there was a party who looked on the whole affair with dissatisfaction. They ventured to express doubts of the guilt of the Vallets, and protested against treating them with so much severity; whilst Antoine Pin, who was assuredly not free from suspicion, was allowed to range the world at pleasure. At last the matter got so public, that it reached Paris; it was talked of at court, and furnished a subject for the salons; and as the fine ladies and gentlemen became curious to learn the truth of the business, orders were forwarded to Dombes to arrest Antoine Pin, and send him forthwith to Pont de l'Ain.

No sooner did the fugitive find himself in prison, than he volunteered a full confession. He said that nobody knew better than he the particulars of poor Sevos's murder; and that he was resolved, be the consequences what they might, that he would disclose the whole truth.

'On the evening of the 19th of February,' said he, 'I and Sevos were drinking in Vallet's house, when Sevos took it into his head, being drunk, to reproach Vallet with being the cause of Dupler's death; whereupon, in a rage, Vallet took up a heavy tin can that stood upon the table, and struck Sevos such a blow on the head with it, that he fell backwards to the earth, crying "Mercy, mercy! Take all my money, but spare my life!" But Vallet saying, "Don't talk to me of mercy!" continued to strike him, whilst his wife, with a fire shovel, also lent her assistance. Even Philippe, the eldest boy, joined in the murderous work; and amongst them, they soon put an end to poor Joseph Sevos: young Pierre the while standing sentinel at the door to keep off intruders. Vallet, when he saw that he had killed Sevos, wanted me to strike him too,' continued Pin, 'lest I should be a witness against him; but I would not. When Sevos was dead, they carried him to the kiln, and there buried him, covering the place with a heap of wood; and on Good-Friday they dug up the body and burned it. I know this, because on that day I called at the kiln, and not only smelt the burning, but saw the burnt bones in the furnace. Vallet told me

that if ever I said a word about the matter, he would serve me as he had served Sevos: but, at the same time, I must own he behaved very handsomely to me in the business, paying my silence liberally both with wine and money.'

This testimony chimed in wonderfully with that of Vaudan; and although the dead body was not forthcoming, that circumstance had little weight, when its disappearance was so well accounted for, and when the story was confirmed by the utter impossibility of finding any traces of Joseph Sevos as a living person. The Vallets, however, persisted in denying the whole affair; they declared themselves innocent, and founded their defence on two circumstances. The first was, that, as they asserted, on the day after the disappearance of Sevos, blood was found in his bed, upon his pillow, on the bedclothes, and on the floor of his room, proving decisively that he had been murdered in his own house, and affording a strong presumption that Antoine Pin was the murderer. The second was, that on the night in question Pierre Vallet, who, according to the evidence admitted, had been so useful a coadjutor in the business, had in fact been absent from home, having slept at the house of his schoolmaster at Poncin, in the same bed with two other boys.

Strange to say, the authorities refused to investigate the truth of these allegations. On the contrary, they maintained that, being accused by two persons of the crime, the strongest suspicion attached to Joseph Vallet, and that his guilt was rather aggravated than otherwise by his attempt to shift the load from his own shoulders to those of Antoine Pin—an attempt in which he had entirely failed; and the attorney-general holding, therefore, the crime proved against him, demanded that sentence of death should be passed against the father, whilst confession should be wrung from the mother and sons by the rack. The jurisdiction of Pont de l'Ain, instead of complying with his request, condemned the whole family to the rack; whereupon Frillet, dissatisfied with a decision which gave the tile-burner a chance for his life, appealed to the parliament or high court of Dijon; who forthwith issued an order, transferring the prisoners to their own fortress; whither they were removed, followed by the hootings and execrations of the excited multitude.

It was soon perceived that the authorities of Dijon meant to treat the matter with more earnestness and impartiality than those of Pont de l'Ain had done. They began by admitting the guilt of Vallet and his family, which they considered established beyond a doubt; but they looked upon Antoine Pin as in all probability equally guilty, and therefore to be treated as a criminal, and not as a witness, as had been hitherto the case. They alleged, in support of this opinion, his bad character, his suspicious flight, his avowed presence at the murder, which he not only made no attempt to prevent, but had since concealed; and they also dwelt on certain conditions he had made when he entered the regiment at Dombes, all tending to his own security in case of being pursued. In hopes of eliciting the truth, he was put to the rack; but the torture he endured did not alter his testimony; it only recalled one additional circumstance; namely, that Vallet had given him a louis-d'or to entice Sevos to his house on the day in question.

The fate of the Vallet family seemed now decided; and their case was the more hopeless, that by this last avowal Pin had brought himself under the arm of the law; but now, when least expected, conscience, that irrepressible witness, awoke and spoke for them. No sooner had he returned to his cell, than the thoughts of destroying a whole family by his perjury overpowered him. He passed a night of sleepless anguish, and when the morning dawned, he requested that some person qualified to receive his confession might be sent to him. One of the barristers engaged in the cause was immediately despatched to the prison, and Antoine Pin made the following narration:—

He confessed that his life had been a series of crimes, and that at length, in 1782, he had fallen upon young Philippe Vallet on the high road, and, without being recognised by the boy, had robbed him of his money and clothes. Sevos, however, hidden behind a bush, had witnessed the crime, and had frequently reminded him that he had it in his power to bring him to the scaffold any day he pleased. He had shown no signs of an intention to do it, but nevertheless the threat disturbed Pin, and he never ceased wishing to get rid of so troublesome an acquaintance.

On the 19th February they had gone together to Vallet's house, where they drank and chatted for some time. Sevos, he said, liked idling and drinking as well as he did: they repaired to various wine-houses after leaving Vallet's, in the last of which they sat till past midnight. There it was that, in a state of maudlin intoxication, Sevos pulled a bag out of his pocket, containing about forty dollars in silver, and exhibited the money to Pin, who was immediately seized with a desire to get possession of the booty, and at the same time relieve himself of a dangerous witness, who might turn against him some day when he least expected it. With this view he accompanied Sevos home, and when they got to the door, he represented that although they had drunk a great deal, they had had nothing to eat, and proposed getting something for supper. Sevos said he was hungry too; whereupon Pin went to the house of Michel Morel, whom he knocked up, and from whom he procured a loaf, which he carried back to Sevos's, having on the way slipped into the house of his own father, and armed himself with a hatchet, which he hid under his coat.

Meanwhile Sevos, overcome by liquor, had lost sight of his hunger, and declared his intention of going immediately to sleep, requesting Pin to pass the night with him, to which the latter consented; and just as the unfortunate host was stepping into bed, Pin, who was standing behind him, brought down the hatchet with tremendous force upon his head. 'Oh God! I'm killed!' were the only words that passed the lips of the victim before he sunk to the earth, bathed in his blood. 'After rifling his pockets, I carried the body on my back to the stable,' continued he, 'where I covered it with manure; and then feeling that Bresse was no safe nest for me, I started for Dombes, and enlisted as a soldier.' He added that, before he quitted the house, he tried, without much effect, to efface the traces of his crime. 'This is the truth,' said he, 'and the whole truth. I had neither aiders nor abettors; no one living was in my confidence; and the Vallets, father, mother, and sons, are innocent of the whole affair.'

On being asked why, if this were the case, he had persisted in accusing the Vallets, he answered that his first intention when he was arrested was to confess the truth, but he had changed his mind; adding that Vaudan, the first witness against the Vallets, was a good-for-nothing scoundrel, on whose testimony no reliance whatever could be placed; and that if they secured him, they would learn what weighty reasons he had for giving false evidence.

As Pin persisted in this story, without waiting to investigate the matter further, he was at once condemned, on his own confession, to be broken on the wheel. He fully admitted the justice of his sentence; and the only request he made was, to be permitted to see the Vallets before he died, which being granted, he threw himself at their feet, reiterating his assertions of their innocence, and intreating their pardon. He seemed really penitent; and great as were his crimes, the earnest desire he evinced in the midst of his tortures to vindicate the guiltless and promote the ends of justice, won him the pardon and pity even of the injured Vallets.

Thus died Antoine Pin: and when he was dead, the authorities bethought themselves of searching the stable for the body, and of verifying his story by ascertaining what traces of the crime had been found about the

house by those who first entered it after the disappearance of Joseph Sevos. But with respect to the house, the bed was gone, the place had been scoured, and nobody seemed able or willing to give any accurate account of what had been observed. Then with regard to the body, which Pin said he had hidden in the stable under a heap of manure, there was not only no body, but not a single bone to be found, nor any appearance to justify the suspicion that a body had ever been there.

Here was a puzzle! But Antoine Pin was silenced for ever, and who was to unravel the mystery? Perhaps Vaudan, whom he had arraigned: but as Pin was gone, if he did not choose to tell the truth, there was nobody to confront him. However, not knowing what else to do, they arrested Vaudan. He persisted in what he had said; 'what he had heard he had heard;' and his evidence was true to a tittle. He felt it his duty to confess to the judge that his character was not unstained; he had *once* in his life committed a dishonest act—stolen three oxen and a filly from his master. The ingenuousness of this needless avowal told much in his favour. Well-nigh at its wits' end, the court was at length induced to call for the records of the whole case as it had been tried at Pont de l'Ain. On looking over the papers, they found such strange informalities, so many unaccountable erasures, and so many equally unaccountable interpolations, that the affair took quite a new turn; and that which nobody had yet dared to suggest, began to be shrewdly suspected; namely, that the attorney-general, Frillet, had been playing a part in the drama, which as little comported with his reputation as with his office. A scrutiny ensued; and the result was, the complete justification of the Vallet family. Not only had every witness against them been either deceivers, or themselves deceived, but the evidences in their favour had been kept back or suppressed. It even came out, and was satisfactorily proved, that distinct traces of the murder had been found in Sevos's room; and that several persons had sworn to the facts before Frillet himself. Nay, not only so, but even traces of blood were still distinctly visible on the floor; and the very instrument with which Antoine Pin said he had committed the murder was discovered in the house.

Considering how very inexpert these officials appear to have been in extricating truth from falsehood, it is fortunate that there seems to have been something in the air of their dungeons that disposed people to confession. No sooner did Vaudan find himself alone in prison, than he declared his intention of clearing up the whole affair. He avowed that his testimony was false from beginning to end; adding that the officer who had summoned him as a witness, had desired him to wait upon the attorney-general as soon as the examination was over, and relate to him all that had passed.

The parliament of Dijon, who, when they had got a criminal, seem to have proceeded with uncompromising diligence, lost no time in passing sentence on Vaudan, who was forthwith conducted to the scaffold, and died asserting the innocence of the Vallets. The real motive of this injudicious haste, which in this case and many others rendered the discovery of truth so difficult, was the fulness of the prisons. No sooner were they satisfied of a man's guilt, than they put him out of the way, to make room for the next comer; frequently thereby not only committing great injustice, but depriving themselves of the most important testimony.

Vaudan was executed on the 5th of October, and on the 12th an order was issued for placing another prisoner on the rack. This was a man called Maurice, who had made himself exceedingly busy in the whole affair, in the case of Sevos as well as of Dupler, and on whom suspicion had at length rested. The moment Maurice felt the thumb-screws, he avowed himself a false witness, in the pay of the attorney-general, who was the originator of the whole cabal against the Vallets. He had desired him to revive the story of Dupler. Maurice declared that he had at first resisted, but that the threats *and promises of Frillet* had at length prevailed. He added that the attorney had two other assistants in the affair; namely, Torrillon, and a forester called Mallet, who had given themselves extraordinary trouble to bring in such witnesses as suited the great man's purpose.

On the 13th, the day after he had made this confession, Maurice was executed; and he also died maintaining the innocence of the Vallets.

They had now put three persons out of the world on account of this affair: one for the murder, and two for perjury. But where was the greatest criminal of all? Where was the attorney-general Frillet? He, the suborner, the worse than murderer, the persecutor of the innocent, the betrayer of his office and his oath, the ten times guilty—he was at large, 'going to and fro upon the earth, and walking up and down on it,' like his great prototype! And where were the Vallets? They were still in prison! Three persons had died declaring their innocence; every witness against them had been convicted of perjury or delusion; not a single circumstance remained uncontradicted that could in anyway connect them with the deaths of either Dupler or Sevos; their justification was indisputable, clear, and triumphant; the whole accusation was proved to be the fruits of a cabal, the offspring of envy and malice: at least if it were not, what had Vaudan and Maurice died for? And yet, on the 13th of October, Frillet was at large, and the Vallets were in prison!

However, they were at length restored to liberty, with a recompense of 500 francs (about L.20), which Maurice had been made to pay as an expiation: at the same time measures were taken for arresting Frillet and his two abettors, Torrillon and the forester; but the attorney-general was too well informed of what was going on to allow himself to be taken. He fled into Savoy, and found refuge in a cloister, where the arm of the law could not reach him.

In the meantime the prosperity of the Vallets was destroyed. Their healths had been injured, their money had gone to the lawyers, their house had been plundered, and everything belonging to them, except the bare walls, had either disappeared or been knocked to pieces. The old man had to begin the world again. It was up-hill work; but he did his best, and in time partially recovered his former position.

Several years had thus elapsed, and the Vallets had fought through the worst of their difficulties, when one day Pierre, the youngest son, being on business at a town called Bourg, met, as he was walking through the market-place, JOSEPH SEVOS! At first he thought it was a phantom of the imagination; but it proved to be no other than the living Sevos, whose disappearance had caused so much trouble. Perceiving himself to be recognised, Sevos attempted to escape in the crowd; Pierre promptly followed, and had the satisfaction of seizing him, and bringing him before a magistrate, of whom he demanded that both himself and the resuscitated man should be held in custody till the mystery could be investigated. The reserve and equivocations with which Sevos sought to baffle inquiry, suggesting a suspicion that he was not altogether innocent; he was accordingly removed to Dijon; but even there, it was not till he was threatened with the rack that the truth was elicited from him.

'On the 19th of February 1724,' said he, 'Antoine Pin and I went out for a day's drinking; and when the wine-houses were all closed, we went together to my house, where I invited him to sleep. I undressed, and was about to step into bed, when I received a violent blow upon the head. I fell to the ground, exclaiming that I was killed; and as I did not stir again, no doubt Pin thought I was. However, I was only stunned. He then rifled my pockets, in which I had about forty dollars, and afterwards dragged me to the stable, and covered me with manure. There I lay and listened till I heard Pin go away; then I went back to the house, and fastening the door, I stanched the blood that flowed from my head as well as I could with old rags. In the morning I bound it up, and bethought me what I

should do; but the fear of Antoine so entirely overcame me, that I durst not leave the house, nor even open the door; and for two whole days and nights I sat there, listening for his return, which I momentarily expected. However, he came no more; and on the third I ventured, before the day had well broken, to slip out; and I managed, without being seen by anybody, to reach the attorney-general's, and to him I related what had happened. He listened to my story with attention, and, after some consideration, he advised me to quit the place. "Pin," said he, "is a villain, who will stick at nothing; and if he finds out you are alive, he will never stop till he has completed his work. Take my advice, and leave this as fast as your legs can carry you, and the farther you go the better."'

Sevos was a timid and weak man: to be once murdered he thought was enough. The advice of so influential a person as Frillet, a man who must necessarily understand the case so well, was not to be neglected. He fled, and never stopped till he thought himself far out of the reach of his enemy. Accident had at length brought him to the market of Bourg, where Pierre Vallet met him.

The agreement between this story and that of Antoine Pin was sufficient to insure its acceptance as far as it went; but it was generally believed that Joseph Sevos, timid as he was, had been influenced by something more than fear to abandon his native place and his little property. The attorney-general's empty-handed recommendation was not likely to have induced a man to condemn himself to exile for such a length of time. However, whether from the apprehension of suffering the legal penalty, as a party in the plot, or from the dread of the great man's vengeance, Sevos could not be brought to any further confession. On this occasion the rack was spared, the desire for a further revelation not being sufficiently strong on the part of the authorities to induce them to have recourse to it.

As soon as the news of Sevos's reappearance reached Frillet, he quitted his sanctuary, and loudly arraigned the parliament of Dijon, not only for their proceedings against himself, but also for having broken Antoine Pin upon the wheel for the murder of a man who was proved never to have been murdered at all. In spite of this, however, they arrested him, and instituted investigations, which led to the conviction of several other persons as parties in the conspiracy of which he had been the contriver: and now that the tide was apparently turning against him, there is no telling how far the tongue of Joseph Sevos might have been loosed, had he not, just at this juncture, most unexpectedly died in prison. Nevertheless, so strong was the evidence against Frillet, that he was condemned to death, and his property mulcted to the amount of 8000 livres, for the benefit of the Vallet family.

Great was the joy of the people. Nine hours had the parliament of Dijon sat before they could agree upon the sentence. The whole town had been in commotion for days; and all seemed anxious for the execution of a man who had proved himself such an oppressor. This vengeful feeling was doomed to be disappointed. The sentence of death against Frillet was commuted by the king into banishment for ten years. He received the intimation with an affectation of pious gratitude; for he seems to have been as great a hypocrite as a sinner. But it was the will of God, whose justice and mercy he had outraged, that he should not profit by the corruption that had spared his life. On the day appointed for his quitting the prison, that life was required of him by a Judge incorruptible—he expired suddenly as they were throwing open the gates to set him free. His coadjutors in crime suffered various degrees of punishment, and the injured Vallets received the 8000 livres.

Perhaps a more extraordinary case of criminal jurisprudence than this is not on record, nor one that exhibits a more frightful picture of the effrontery with which the strong dared to oppress the weak, or of the carelessness, precipitance, and contempt for the most ordinary principles of justice with which, at one period, the judicial proceedings of France were conducted.

LEIGH HUNT'S STORIES FROM THE ITALIAN POETS.

Mr Hunt's remarkable powers as a transfuser of the spirit and grace of the classic and Italian poets into our own tongue, disposed us to hope much from this work; and we have not been disappointed. Although wholly, or all but wholly in prose, it is calculated to convey perhaps as correct a view of the great poets of Italy—Dante, Pulci, Boiardo, Ariosto, and Tasso—and of their celebrated epics, as is attainable through the medium of a foreign language. It will therefore suit a vast class of readers who, with no reason to hope that they will ever become acquainted with these authors in the original, may yet desire to obtain some knowledge of their works, both on account of the works themselves, and that they may not be entirely at a loss when the Italian poets are a subject of allusion in conversation.

No literary name is, we believe, more worshipped in Italy than that of Dante, who is the first in time also, a predecessor by about sixty years of our Chaucer. His *Divina Comedia* (called comedy with a regard merely to its literary style) is certainly a wonderful work; yet, as far as we can judge, Mr Hunt draws a just discrimination between the literary excellences for which one would wish it to be preserved, and the abominable spirit in which much of it is written. This poet seems to have been partly a victim of the political dissensions of his country (Florence, from which he was banished), and partly of his own fierce and self-concentrated nature. A stern, swarthy, hook-nosed, bilious little man he was, with thousands of enmities always on his hands, and a terrific theological creed in his brain. The two first parts of his great poem—descriptions of hell and purgatory—are accordingly little more than vents of personal wrath and malignity. Whoever had at any time offended Dante, that man must take his place in some situation of torment horrible to think of. The worthiest and best are represented as undergoing awful punishments, if they had chanced to come to a sudden death, leaving no opportunity of certain religious rites being performed by them on their deathbeds. One cannot sufficiently marvel at a great poet, for such he really was, going about Italy almost in a mendicant state for about sixteen years, secretly employed all the time in gratifying his destructiveness by thus pillorying friend and foe to all time. As might be expected, the work did not appear till after his death.

Mr Hunt's remarks on the character of Dante appear to us just and true; he speaks with becoming horror of the evil passions which vein the Divina Comedia as with streaks of fire, and also of the justifications which they have met with at the hands of partial critics. From this part of the work we select a few scattered passages, which are worth treasuring in the memory:—

'Genius and worldly power, unless for worldly purposes, find it difficult to accord, especially in tempers like his [Dante's]. There must be great wisdom and amiableness on both sides, to save them from jealousy of one another's pretensions.'

'The tragical as well as fantastic tricks which

> Man, proud man,
> Dressed in a little brief authority,

plays with his energy and bad passions, under the guise of duty, is amongst the most perplexing of those spectacles which, according to a greater understanding than Dante's, "make the angels weep."'

'All gentle and considerate hearts must dislike the rage and bigotry in Dante, even were it true that Italy will never be regenerated till one half of it is baptised in the blood of the other. Such men [as Ugo Foscolo,

who thought so], with all their acuteness, are incapable of seeing what can be effected by nobler and serener times, and the progress of civilisation. One calm discovery of science may do away with all the boasted necessities of the angry and self-idolatrous.'

'Luckily, assent is not belief; and mankind's feelings are for the most part superior to their opinions; otherwise the world would have been in a bad way indeed, and nature not been vindicated of her children.'

But of the poem itself, let us, if possible, present some specimen—something which our readers may find neither beyond their comprehension nor their sympathies. Of all parts of it, none seem to have made a greater impression on all classes of persons than the two stories of Paulo and Francesca, and the Count Ugolino. The former has often been pronounced faultless, and is, says Mr Hunt, 'unquestionably one of the most beautiful pieces of writing in the world.' Strange to say, considering what sort of person was its author, its chief beauty is that of tenderness. It comes in as the breath of Araby would amidst a circumpolar winter. The whole thing is rather an exquisite hint than a story. We give a portion of it from Mr Hunt's poetical version, in the triplet stanzas of the original:—

'Scarce had I learnt the names of all that press
Of knights and dames, than I beheld a sight
Nigh reft my wits for very tenderness.

"O guide!" I said, "fain would I, if I might,
Have speech with yonder pair, that hand in hand
Seem borne before the dreadful wind so light."

"Wait," said my guide, "until thou seest their band
Sweep round. Then beg them, by that love, to stay;
And they will come, and hover where we stand."

Anon the whirlwind flung them round that way;
And then I cried, "Oh, if I ask nought ill,
Poor weary souls, have speech with me I pray."

As doves, that leave some bevy circling still,
Set firm their open wings, and through the air
Sweep homewards, wafted by their pure good will;

So broke from Dido's flock that gentle pair,
Cleaving, to where we stood, the air malign;
Such strength to bring them had a loving prayer.

The female spoke. "O living soul benign!"
She said, "thus, in this lost air, visiting
Us who with blood stained the sweet earth divine;

Had we a friend in heaven's eternal King,
We would beseech him keep thy conscience clear,
Since to our anguish thou dost pity bring.

Of what it pleaseth thee to speak and hear,
To that we also, till this lull be o'er
That falleth now, will speak and will give ear.

The place where I was born is on the shore,
Where Po brings all his rivers to depart
In peace, and fuse them with the ocean floor.

Love, that soon kindleth in a gentle heart,
Seized him thou look'st on for the form and face,
Whose end still haunts me like a rankling dart.

Love, which by love will be denied no grace,
Gave me a transport in my turn so true,
That lo! 'tis with me, even in this place.

Love brought us to one grave. The hand that slew
Is doomed to mourn us in the pit of Cain."
Such were the words that told me of those two.

Downcast I stood, looking so full of pain
To think how hard and sad a case it was,
That my guide asked what held me in that vein.

His voice aroused me; and I said, "Alas!
All their sweet thoughts then, all the steps that led
To love, but brought them to this dolorous pass."

Then turning my sad eyes to theirs, I said,
"Francesca, see, these human cheeks are wet—
Truer and sadder tears were never shed."'

In answer to the poet's request, the lady relates some particulars of her story, and then he adds:—

'While thus one spoke, the other spirit mourned
With wail so woful, that at his remorse
I felt as though I should have died.' * *

The story of Ugolino is well known, from its having been so often painted. Our own Sir Joshua tried it. The real fact here was, that the count betrayed the castle of Pisa to the Florentines, and, as a punishment, was starved with some of his relations in a tower. Dante represents him in the infernal regions as revenging himself on the Archbishop Ruggieri, who, however, is believed to have been innocent in the case.

'The pilgrims went on, and beheld two other spirits so closely locked up together in one hole of the ice, that the head of one was right over the other's, like a cowl; and Dante, to his horror, saw that the upper head was devouring the lower with all the eagerness of a man who is famished. The poet asked what could possibly make him show a hate so brutal; adding, that if there were any ground for it, he would tell the story to the world.

'The sinner raised his head from the dire repast, and after wiping his jaws with the hair of it, said, "You ask a thing which it shakes me to the heart to think of. It is a story to renew all my misery. But since it will produce this wretch his due infamy, hear it, and you shall see me speak and weep at the same time. How thou camest hither I know not; but I perceive by thy speech that thou art Florentine.

"Learn, then, that I was the Count Ugolino, and this man was Ruggieri the archbishop. How I trusted him, and was betrayed into prison, there is no need to relate; but of his treatment of me there, and how cruel a death I underwent, hear; and then judge if he has offended me.

"I had been imprisoned with my children a long time in the tower, which has since been called from me the Tower of Famine; and many a new moon had I seen through the hole that served us for a window, when I dreamt a dream that foreshadowed to me what was coming. Methought that this man headed a great chase against the wolf, in the mountains between Pisa and Lucca. Among the foremost in his party were Gualandi, Sismondi, and Lanfranchi, and the hounds were thin and eager, and high-bred; and in a little while I saw the hounds fasten on the flanks of the wolf and the wolf's children, and tear them. At that moment I awoke with the voices of my own children in my ears asking for bread. Truly cruel must thou be, if thy heart does not ache to think of what I thought then. If thou feel not for a pang like that, what is it for which thou art accustomed to feel? We were now all awake; and the time was at hand when they brought us bread, and we had all dreamt dreams which made us anxious. At that moment I heard the key of the horrible tower turn in the lock of the door below, and fasten it. I looked at my children, and said not a word. I did not weep. I made a strong effort upon the soul within me. But my little Anselm said, 'Father, why do you look so? Is anything the matter?' Nevertheless, I did not weep, nor say a word all the day, nor the night that followed. In the morning a ray of light fell upon us through the window of our sad prison, and I beheld in those four little faces the likeness of my own face, and then I began to gnaw my hands for misery. My children, thinking I did it for hunger, raised themselves on the floor, and said, 'Father, we should be less miserable if you would eat our own flesh. It was you that gave it us. Take it again.' Then I sat still, in order not to make them unhappier: and that day and the next we all remained without speaking. On the fourth day, Gaddo stretched himself at my feet, and said, 'Father, why wont you help me?' and there he died. And as surely as thou lookest on me, so surely I beheld the whole three die in the same manner. So I began in my misery to grope about in the dark for them, for I had become blind; and three days I kept calling on them by name, though they were dead; till famine did for me what grief had been unable to do."

'With these words the miserable man, his eyes starting from his head, seized that other wretch again with his teeth, and ground them against the skull as a dog does with a bone.

'O Pisa! scandal of the nations! since thy neighbours are so slow to punish thee, may the very islands tear themselves up from their roots in the sea, and come and block up the mouth of thy river, and drown every soul within thee! What if this Count Ugolino did, as report says he did, betray thy castles to the enemy? his children had not betrayed them; nor ought they to have been put to an agony like this. Their age was their innocence; and their deaths have given thee the infamy of a second Thebes.'

Our space forbids us to enter upon the consideration of any of the other stories from the Italian poets; but we may point out a few more remarkable passages in the biographical and critical matter of these volumes. Treating of Astolpho's Journey to the Moon, a poem of Ariosto, Mr Hunt observes that the moon of that poet, as well as of Milton, is a finer thing than that of the modern astronomer—with its no-atmosphere, and its no-water, and its tremendous precipices. 'It is to be hoped (and believed),' he adds, 'that knowledge will be best for us all in the end; for it is not always so by the way. It displaces beautiful ignorances.' We thoroughly believe that, for whatever of beautiful or romantic it removes, it tends to supply matter for a far higher gratification to the same or other faculties. For one instance as all-sufficient, how much grander—how much more suited for all the noblest purposes of poetry—is the universe of the modern astronomer than that of the ignorant man!

With regard to the supposition of some authors, that Pulci, being a comic poet, received the speculations on matters of opinion in his *Morgante* from other writers, his friends, Mr Hunt pertinently says—'as if a man of genius, however lively, did not go through the gravest reflections in the course of his life, or could not enter into any theological or metaphysical question to which he chose to direct his attention. Animal spirits themselves are too often but a counterbalance to the most thoughtful melancholy.' One cause, too, for this kind of error is, that the public have always a difficulty in regarding a man in any but one point of view.

Of Ariosto's *Orlando Furioso* Mr Hunt says—'Like all originals, it was obliged to wait for the death of the envious and the self-loving, before it acquired a popularity which surpassed all precedent. Foscolo says, that Macchiavelli and Ariosto, "the two writers of that age who really possessed most excellence, were the least praised during their lives. Bembo [now neglected] was approached in a posture of adoration and fear; the infamous Aretino extorted a fulsome letter of praises from the great and learned." He might have added, that the writer most in request "in the circles" was a gentleman of the name of Bernardo Accolti, then called the *Unique*, now never heard of. Ariosto himself eulogised him among a shoal of writers, half of whose names have perished, and who most likely included in that half the men who thought he did not praise them enough. For such was the fact! I allude to the charming invention in his last canto, in which he supposes himself welcomed home after a long voyage. Some of the persons thus honoured by Ariosto were vexed, it is said, at not being praised highly enough; others at seeing so many praised in their company; some at being left out of the list; and some others at not being mentioned at all! * * Happily for them, the names of most of these mighty personages are not known. One or two, however, took care to make posterity laugh. Trissino, a very great man in his day, and the would-be restorer of the ancient epic, had the face, in return for the poet's too-honourable mention of him, to speak in his own verses of "Ariosto, with that Furioso of his, which pleases the vulgar." "*His* poem," adds Panizzi, "has had the merit of not having pleased anybody." A sullen critic, Sperone, was so disappointed at being left out, that he became the poet's bitter enemy. He talked of Ariosto taking himself for a swan, and "dying like a goose" (the allusion was to the fragment he left, called the *Five Cantos*). What has become of the swan Sperone?'

How difficult, however, amongst any set of contemporary authors, to say which are to be the forgotten and which the remembered! The great bulk of those at first neglected, undoubtedly continue to be so; and on the other hand, it often happens that the man most appreciated by posterity, was the man most appreciated also in his own time.

THE TOLLMAN.

STRETCH my philanthropy as I may, it will in nowise embrace him. There is something so annoying and vexatious about the whole status and functions of this official, that 'twere more than is to be expected of mortal patience to look upon him complacently. See the cold-hearted wretch planted in his vile little cot, like a spider in his den, ready to pounce out upon every passenger from whom he is entitled to exact his odious dues. No compunction or sympathy has he for any fellow-mortal. It may be a wedding party rolling gaily and merrily along to church; it may be a funeral train; the parson; the country surgeon; a set of ladies and gentlemen caracoling forth for pleasure; a chain of dull patient carriers' wagons heaving slowly forward on their laborious mission—the Alexandrine of the road. No matter who it be, what it be, or how or whence it be, this atrocious tollman is sure to present his harsh passively-compelling visage, uncharged with any feeling whatever, save the stern resolve to withstand passage until a certain sum has been paid. No thanks, no relentings of a humane courtesy from the tollman. He approaches and he takes his leave as a declared enemy. The victim, once forced to render his dues, becomes the husk of an idea, and may go where he pleases. Surely this is an amazing image of individual atrocity to be kept up in an age remarkable, upon the whole, for its exemption from downright barbarisms. The only personage with whom he can be at all compared is the tower-pent baron of the fourteenth century, who obliged all travellers passing his residence to stop and yield him at once reverence and tribute; but the romance is here wanting, and we feel how different was the armed barbarian who, in robbing, took his chance of thwacks and cuts, from the base mechanical varlet who plunders you in regulated sums (giving back with disgusting accuracy coppers in change), secure under the banner of some mean-featured act of parliament which he has got inscribed upon a board beside his door in letters of statutory magnitude. Oh profane not the middle ages with any such reference! Surely the veriest, vilest wretch that now breathes, or ever did breathe, is—the Tollman!

I don't know either. Human life is a blotted page. Men are often the victims of infelicitous circumstances. Possibly even tollmen, if you could get to the bottom of them, might in some instances be found to possess respectable and amiable qualities, only overlaid and disgraced by the sad necessities of their lot. Perhaps Cromwells and Miltons might be discovered amongst them—hands that the rod of empire might have swayed, or waked to ecstacy the living lyre. Even in that ill-favoured corduroyed form there may be faculties that, in better circumstances, could have melted at the tale of wo, or struggled to help forward the cause of suffering humanity. Coarse, insolent, dogged, 'not to be done,' as he now looks, he doubtless once lay a babe upon his mother's gentle bosom—innocent, smiling, and loveable; undreaming of ever having to assert his title to twopences over contumacious carters. Lovely was he at his christening in the old parish kirk; pleasant to look upon in his first breeks. Wandered he oft with his flaxen-headed companions to muse and sport through innocent hours amongst the gowans and rushes by green

burn-sides, while as yet he knew not what grown men have to do for bread. Since then, the strong necessity of a subsistence has driven him, as it drives us all; and, behold, it has been his lot to keep a toll! Perhaps this has been less the poor man's fault than his misfortune—and what a misfortune to have been forced to take to the road even in this modified form of the destiny! There he is, the universal enemy! cut off and dissociated from all of his own kind, as one with whom none have any sympathies—the man whom they may not be quarrelling with to-day, but with whom they may have to quarrel to-morrow, and whom it is therefore necessary to keep ever at arm's length. Backing and countenance he never gets from a single human being, except as a cold official matter from road trustees, and even that by compulsion. It is not wonderful, in such circumstances, that tollmen are all unhappy. How can it be otherwise with men who have no friends? Thus regarded, and not as the insolent tyrants that look in at coach windows to extort our money, tollmen become objects of pity. We ought perhaps only to condemn the system which tempts poor men into such unhallowed situations. To this, doubtless, must be attributed much of the harshness which we complain of in tollmen. Their suspicious looks are induced by liability to be bilked, and they stand upon their twopences rather in a transport of misanthropy, resulting from their unsocial position, than from any immediate love of the lucre.

But what a base and absurd system is this of tolling, taken altogether! Not only for its betraying simple rustics into miserable lives would I anathematise it, but as a wholly rude and clumsy expedient for its purpose, and one entailing equally endless and needless vexation upon us poor members of that generally ill-used compound personality—the public. Let any one recall for a moment the annoyances to which he has been subjected throughout life by tolls. Say you have been travelling by night in your own vehicle, and desiderate a little sleep. After much coaxing, Morpheus gently lights upon your prostrate senses; but lo! ere ten minutes have elapsed, the horses are pulled up abruptly, and the coachman commences bawling for the turnpike-man to arouse himself. You start up in alarm, and for hours can sleep no more. Say you are setting out on a party of pleasure, full of joyful anticipations—nice friends, capital cold turkey, with some sherry, in a basket under the seat—pleasant sunny morning: a joke already established, which is to be the key-note for all the gay nonsense of the day: behold, in the midst of your enjoyments, a halt is called, and a hard hirsute hand is presented—THE TOLL! You have to stop short in perhaps one of your drollest whimsies, to twitch out one or two shillings to the horrid intruder. The coachman drives on; you try to resume the suspended joke; but no—your mind has been disturbed by an alien idea; and the rest of the matter is as flat as fifty flounders. Or it may be that you have obtained from her 'mamma' the privilege of driving your fair one out. Conversation has reached a most interesting point. The next gentle accents of the adorable are likely to be those which are to make you blest. When lo! a turnpike. At sight of the tollman love claps his soft wings, and in a moment flies. Once thus broken, it is impossible to bring the discourse exactly to the same point again, and so you are for that time, perhaps for ever, disappointed. On a thousand such interesting occasions may the dire Gorgon of a tollman come in to mar your happiness, taxing your purse much, but your patience a hundred times more. Is taxation so agreeable a thing that we should have it thus intruded upon us at the most critical times, and distributed, as it were, over the hours of our existence? What worse, I would ask, was the introduction of the skeleton at the Egyptian banquets? Though Englishmen wished to have something disagreeable presented to their thoughts at regular intervals, could they hit upon a better plan for the purpose than to have their roads beset with tolls?

Surely, when nice and convenient regulations are making in all departments of our social economy, it is time that this enginery, worthy only of the fourteenth century, or of a country in the condition of Spain at this day, were replaced by something more smooth in its working, and involving less expense for its support. Were our letters still carried each by private couriers, or were the poor left to beg each for his own support by wandering throughout the country, it would be in perfect analogy with this plan for keeping up roads. Not wonderful is it to find, as Mr Pagan assures us,* that of the money raised for the roads of the county of Fife, seventy or eighty per cent. goes to the expense of collection, not to speak of continual litigation occasioned by collisions between those unhappy beings, the tollmen and their victims. Surely it is most desirable that this expense were reduced, that tollmen were set free from a life so wretched, and that less exercise for the Hampden spirit were called for in our carmen and postilions.

Oh, my countrymen, for a Rowland Hill of tolls!

THE YOUNG PHILOSOPHER.

'TELL me, father, what is meant by geometry?' Such were the words of a child of nine years old one summer evening in the year 1632. They were uttered in a large room in a house in Paris, and addressed to a pale, intelligent-looking man in the prime of life. He was seated at a table covered with books, maps, &c. and the shade which deep thought and incessant study had cast over his brow, was dissipated by the well-pleased smile with which he gazed on the upturned face of his little son. It was no common countenance he looked on: childish as were the features, mind had stamped them, and a fervent soul looked through those bright young eyes, as the boy anxiously awaited his father's reply.

'Geometry, my child, is the science which considers the extent of bodies; that is to say, their three dimensions—length, breadth, and depth; it teaches how to form figures in a just, precise manner, and to compare them one with another.'

'Father,' said the child, 'I will learn geometry!'

'Nay, my boy, you are too young and sickly for such a study; you have been all day poring over your books. Go now into the garden with your cousin Charles, and have a pleasant game of play this fine evening.'

'I don't care for the playthings that amuse Charles, and he does not like my books. Do, father, let me stay here with you; and tell me if the straight and round lines you often draw are part of geometry?'

The father sighed as he looked at the slight delicate form and flushed cheek of his son, and taking the little burning hand in his, and putting aside his books, 'Well, Blaise,' he answered, 'I will take a walk with you myself, and we will breathe the fresh air, and smell the sweet flowers; but you must ask me no more questions about geometry.'

Such was one of the first manifestations of Blaise Pascal's intellect: the early dawning of that mathematical genius destined in a few years to astonish Europe, and which would probably have achieved wonders in science, rivalling the subsequent discoveries of Newton and La Place, had he not, while still young, abandoned the pursuit of earthly knowledge, and dedicated all his powers of mind and body to the service of religion and the good of his fellow-men.

His father, Etienne Pascal, was a man of talent, well known and much esteemed by the literati of his day. He felt a parent's pride in watching the opening powers of his son's mind, but he also felt a parent's fears for the fragile form which enshrined it, and he wisely sought to draw the little Blaise from his darling sedentary studies, and induce him to share in the out-door amusements which boys of his age in general love. Having himself experienced the absorbing nature of

* See Journal for April 19, 1845.

mathematical pursuits, he did not wish his son to engage in them until his mind should be matured and his body in greater vigour; and as Blaise did not again mention the word geometry, and ceased to linger so long in the study, his father hoped that balls and hoops had at length chased circles and triangles from his brain. At the end of a long corridor in M. Pascal's house there was an apartment which was used only as a lumber-room, and consequently seldom opened. He one day entered it in search of some article, and what was his surprise to see little Blaise kneeling on the floor, and, with a piece of charcoal in his hand, busily occupied in drawing triangles, circles, and parallelograms. The child was so much absorbed in his employment that he heeded not the opening of the door, and it was not till his father spoke that he raised his head. 'What are you doing, child?'

'Oh father, don't be angry; indeed I could not put geometry out of my mind; every night I used to lie awake thinking of it, and so I came here to work away at these lines.'

M. Pascal looked, and with delighted astonishment perceived that his child, without instruction, without knowing the name of a single geometrical figure, had demonstrated that the three angles of every triangle, taken together, are equal to two right angles—a truth established by the thirty-second proposition of the first book of Euclid. The father now saw that it was in vain to repress his son's thirst for knowledge: he gave him every assistance in the study of mathematics, while at the same time he watched over his health. Arrived at the age of eleven years, this wonderful boy composed a treatise on the nature of sound; in which he sought to explain why a glass, when struck by a knife, gives a sound that ceases as soon as the hand is applied to it. Five years afterwards appeared his celebrated 'Treatise on Conic Sections,' admired by the great mathematicians of the time. The famous Descartes could not be persuaded that a work displaying so profound an acquaintance with science, was the production of a youth of sixteen. Yet it is quite certain that Blaise Pascal was its sole and unaided author.

He had often observed that the science of numbers is, like the thoughts of men, subject to error: he had seen that, in the every-day use of calculation, it is very difficult to preserve exactness for any considerable time; because memory becomes weary still sooner than patience; and when the first of these faculties fails, it follows, as a matter of course, that mistakes escape notice. In order, then, to remedy this defect, he constructed the well-known and singular arithmetical machine by which, without a pen, without counters, and without understanding arithmetic, all kinds of computation may be readily performed. 'By other methods,' said he, in writing to Christina, queen of Sweden, 'all the operations are troublesome, complicated, long, and uncertain; by mine they become easy, simple, quick, and certain.'

Le Père Mersenne, a Parisian monk, about this time proposed to the world of science a famous and difficult problem. It was required to determine the curve line described in the air by a nail attached to the circumference of a carriage-wheel revolving and progressing at an ordinary speed. It would not be interesting, nor perhaps intelligible, to general readers, were we to attempt explaining the difficulties which, in the then state of mathematical science, attended the solution of this problem. It will suffice to state that, after having baffled the efforts of all the great men of the day, it was solved by Pascal, when not twenty years old, and while lying on a bed of sickness. More than this: he defied all the mathematicians of Europe to resolve in detail the difficulties of the problem, offering four hundred francs (equal to two thousand in the present day) to him who should succeed. All having failed, Pascal gave his own solution to the world, and from that moment took his place in the first rank of science.

Torricelli, an eminent Italian mathematician, taught by Galileo that air is a ponderable fluid, tried several experiments by producing a vacuum. These induced Pascal to try some others, which he caused to be made by his brother-in-law, M. Perier, on the mountain of Puy de Dome, in the province of Auvergne, and which were crowned with brilliant success. Galileo had discovered the weight of the air; Torricelli, measuring the pressure of the atmosphere, had found it equal to a column of water of the same base, and thirty-two feet in height, or to one of quicksilver of twenty-eight inches. The experiments of Pascal confirmed the others, because they established the fact, that the column of mercury becomes low in the same proportion that the one of air diminishes in height. He was the first who proved clearly, in a 'Treatise on the Weight and Density of the Air,' that the effects—until then attributed to nature's abhorring a vacuum—are derived from the weight of the atmospheric air: and reversing this point in the physics of the ancients, he established, as a principle thenceforth incontestable, that the mass of this fluid has a limited and determinable weight; that it weighs more at one time than at another, as in thick fogs; in certain places than in others, as in valleys and on low ground; that, pressing on all the bodies which it surrounds, it acts more powerfully in proportion to its increase of weight. From these facts he deduced several consequences, such as ascertaining whether two places are on the same level; that is to say, equally distant from the centre of the earth; or which of the two is most elevated, however distant from each other they may be. It remained for him to show that a small quantity of water may keep a great weight balanced; that two weights of different materials, adjusted, while the air is dry, to the most perfect equilibrium, lose their equality when the air becomes damp; that bodies floating in water weigh precisely as much as the liquid they displace; because the water touching them from beneath, and not from above, serves only to raise them. Having established these preliminary facts, he published a 'Treatise on the Equilibrium of Fluids.'

In the present day, when immense progress has been made both in physics and geometry, the writings of Pascal on these subjects are not of much practical utility; but when we reflect that from them we derive our first knowledge, we shall always regard them with the respect due to monuments of a genius, which has left its immortal impress on even the most trifling details.

Having passed some years in these studies and recreations, he suddenly resolved to devote the remainder of his life to an exposition of the Christian religion. For this purpose he returned to Paris, where, amid the interruptions caused by frequent attacks of illness, he conceived and partly executed a comprehensive work on Christianity, its nature and evidences. This he did not live to complete; but some of its detached fragments, found after his death, were published as his 'Thoughts.' They contain the germ of many a noble sentiment and profound view of human nature, which, had they been wrought out, and the rough outline filled up by a master's hand, would have formed a work fit for immortality. About this period of his life he published the 'Provincial Letters,' which have been characterised by competent judges as the most perfect prose work in the French language. They treat of the points in dispute between the Jansenists, whose cause Pascal espoused, and the company of Jesuits. We find in them the pointed wit and dramatic powers of Molière, mingled with the sublime eloquence of Bossuet. When the latter was asked which book in the world he would choose to have been the author of, he immediately replied, 'the Provincial Letters.'

Pascal in his thirtieth year already exhibited the symptoms of premature decay. He was an old man at that period when it is generally considered that both the physical and mental powers are most fully developed. But his health had sustained a severe shock from his intense application to study, no less than from the ever-stirring activity of his genius. He had been for many

years under the care of medical men. Perceiving that the cure of their patient could not be effected so long as he persisted in the indulgence of his sedentary and studious habits, the physicians advised him to take as much exercise as possible, which would at once strengthen his enfeebled frame and divert him from his mental fatigue. In pursuance of this advice, Pascal used to go out in a carriage every day to the bridge of Neuilli. His only surviving and fondly-loved sister, Madame Perier, who with her husband and family resided in the country, frequently visited him, and left nothing undone that affection could suggest to support and cheer him. One morning in the month of October 1654, she accompanied him in his accustomed drive. The day was lovely, and Pascal's enfeebled frame seemed to receive strength from the balmy air, while he conversed with ease and pleasure. He spoke of the folly of national antipathies, and the sin of war. 'Fancy,' he said, 'a Frenchman addressing an Englishman, and asking him, "Why do you want to kill me?" "What!" the other answers, "don't you live at the other side of the water? My friend, if you lived on this side, I should be an assassin, and it would be most unjust to kill you; but as you live at the other side, I'm a brave fellow, and feel quite justified in taking your life." Persons of great and little minds,' he afterwards remarked, 'are subject to the same accidents and annoyances; but the latter are on the circumference of the wheel, and the former near the centre, and thus are they less agitated by the same movements. Yet even in his loftiest state, what is man, fettered as he is by a frail body! The mind of the greatest man in the world is not so independent as to remain undisturbed by the noise around him. It does not require the sound of a cannon to impede his train of thought; the winding of a pulley, or the shutting of a door, is sufficient. Don't be astonished that the philosopher reasons badly now; a fly is buzzing about his ears; that's enough to render him incapable of deep reflection. If you want him to discover truth, drive away the insect which keeps his reason in check, and troubles the powerful intelligence that governs cities and kingdoms. Yet is the study of the human mind, in all its greatness and littleness, the noblest of pursuits.'

'I have often regretted, dear brother,' said Madame Perier, 'your relinquishing the grand career of science you had entered on, and changing so completely your course of thought.'

'Dear sister,' said Pascal, 'I had passed much time in the study of abstract sciences; but it disheartened me to find how few persons there were with whom I could hold communion about them. When I commenced the study of man, I saw that these abstract sciences are not fitted for him, and that I wandered farther from my path in diving into them, than did others in avoiding them; and I forgave them their ignorance. I believed that I should find companions, at least in the study of man, because it is the knowledge which best befits him. I was deceived: there are yet fewer who study man than geometry.'

While thus speaking they came to the bridge; and the horses taking fright, and refusing all control, plunged headlong into the river Seine. Fortunately, however, the strong concussion broke their harness, and the carriage remained on the border of the precipice, while the horses were hurled below. By this means the life of Pascal was saved from instantaneous destruction; but his health received, nevertheless, a severe shock. One may easily imagine what effect this sudden fright and violent motion must have produced in the weakened state of his constitution. He fell into a fit, from which he was with great difficulty recovered. A severe illness followed, the effects of which he never got quite over. Yet the gentle and fervent charity of his nature shone forth all the more brilliantly for his bodily sufferings. He gave alms to an extent which appeared folly to his acquaintances. One of them lectured him one day on his imprudent expenditure, which, he affirmed, would speedily bring him to poverty. Pascal smiled, and quietly replied, 'I have often remarked, that however poor a man may be when dying, he always leaves something behind him.'

He denied himself the comforts, and even the necessaries of life, in order to minister more abundantly to the wants of the poor. He always preserved the utmost purity of mind and manners; and he would never suffer the pleasures of the table to be extolled in his presence, remarking, that food was simply intended to satisfy the appetite and nourish the body, not to pamper the senses. The unfortunate ever found in him a brother. One day, as he was returning from the church of St Sulpice, he was accosted by a young and beautiful peasant girl. 'Oh, sir,' she said, 'for the love of God give me a few sous!'

Pascal stopped, touched at the danger to which her youth and beauty would expose her, if suffered to wander unprotected through the streets of Paris. He inquired into her history. 'My father,' she said, 'was a mason, and lived some leagues from the city. A short time since he fell from some scaffolding, and was killed on the spot, leaving my mother and me alone and friend less in the world. We managed for a time to support ourselves, till my mother's health failed; and after struggling in vain against her illness, she this morning entered the hospital, where, though I can visit her, I am not permitted to live, so that, to avoid starvation, I am forced to beg.'

'My poor child,' said Pascal, 'yours is a hard lot; I will try what can be done for you.'

He immediately conducted her to the house of a venerable ecclesiastic, to whom, without making himself known, he gave a sum of money sufficient for her food and clothing, promising to send next day a charitable lady to take charge of her. This was Madame Perier, who entered warmly into her brother's benevolent feelings, and took care of the grateful young girl until a respectable situation was provided for her. Who can describe the feelings of the poor sick mother when she heard of the kindness that had been shown her daughter! She longed to bless her benefactor, her guardian angel, who had saved her child from misery, perhaps from ruin. Yet Pascal would not suffer his name to be disclosed, and it was not till after his death that he was known to have performed this good action. Truly might it be said that he

> 'Did good by stealth, and blushed to find it fame.'

Notwithstanding his habitual gravity, he had a fund of natural wit, and keen penetration into character; and could have been sarcastic, but the overflowing kindliness of his temperament forbade it. He one day remarked, 'The authors who are incessantly announcing *my* book, *my* history, *my* commentary, would they not do better to say, *our* book, *our* commentary, *our* history? for, generally speaking, there is more in their works that belongs to others than to themselves.'

One of his maxims was, 'If you wish others to speak well of you, do not speak well of yourself.' Another just remark was this—'In proportion as we have our minds enlarged, we discover in the world a greater number of original characters—commonplace people do not perceive any distinguishing difference between men.'

It may not be out of place to cite a remark of Pascal's, alluding to the strange political revolutions of Europe, and the casting down of crowned heads, which took place in his day. He says, 'Who would ever have supposed that an individual possessing the friendship of the king of England, the king of Poland, and the queen of Sweden, might be left destitute in the world, without an asylum or retreat?'

This refers to three revolutions which had occurred in Europe nearly at the same time.

We will now set down, somewhat at random, a few of his remarks breathing a spirit of true philosophy.

'There is nothing more common than good things; all we require is to discern them; and it is certain they

are all natural, and within our reach. Yet it is universally the case that we do not know how to distinguish them. It is not among strange and extraordinary things that we are to look for excellence. In rising to attain it, we but leave it behind us. We must stoop. The best books are those which each reader thinks he could have written himself. Nature, which is alone good, is common and familiar to all.'

'Curiosity is often but vanity. Most frequently we wish for knowledge, only in order to speak of it. We would not undertake a long sea voyage, if we were never to talk about it; and for the simple pleasure of seeing, without the hope of conversing with any one about our travels.'

'A horse does not seek to be admired by his companion. We see indeed a sort of emulation between them in the race, but it is not followed up; for when in the stable, the most clumsy and worst-made horse will not yield his oats to another. It is not so with men: they rest not satisfied with their perfections, unless they are made the means of asserting their superiority over others.'

'The virtue of a man ought not to be measured by one or two unusual efforts, but by his habitual course of life.'

'Nature has perfections, to show that she is the image of God; and defects, to show that she is only his image.'

Many of his most valuable remarks have been lost, from his neglecting to write them down; intrusting them to his memory, which was indeed so great, that he was never known to forget anything which he had once imprinted on his mind.

The enemies of Pascal thought to diminish his glory by suppressing his eulogium in the 'Lives of Illustrious Men,' by Perrault; but this only served to enhance it the more, for every one applied to them the words of Tacitus—'Cassius and Brutus shone more brightly because their images were not seen.'

The life of Blaise Pascal drew near its termination. A fatal disease was preying upon him, brought on by the intense working of a mighty soul, enshrined in a feeble body—'Its shell the spirit wore.' A deep shade of gloom and despondency, arising from physical causes, often clouded his mind. But his sufferings were soothed by the fond attentions of his sister. She brought her family to Paris, and having taken a house near his, devoted herself to him with anxious affection. One day, while still able to walk out, he was accosted in the street by a wretched-looking man holding a little boy by the hand. His countenance showed marks of suffering, and his tale was a sad one. He had been a journeyman shoemaker, and lived happily with his wife and little ones, inhabiting a small house in the outskirts of Paris. A fire broke out one night; his little dwelling, with all that it contained, was consumed. He and his family escaped with their lives; but, from exposure to cold and anxiety, his wife and two children fell victims to fever; and he, only just recovered from the same disease, was forced, with his remaining child, to beg a morsel of bread. Pascal's heart was touched by his tale, and, not satisfied with relieving his immediate wants, he took him to his own house, and desired him to make it his home until his health should be re-established, and he should be able to procure work. Some days passed on, and Pascal became rapidly worse: he could with difficulty leave his room, and was forced to discontinue his accustomed walks. His sister's fond cares were now indispensable to his comfort: every day she passed in his chamber, ministering to his wants, and learning holy lessons of patience and resignation, springing from love to God, and submission to His holy will. The poor shoemaker also tried, by every means in his power, to serve his benefactor; and the pleasant laugh and winning ways of his little son George often soothed and cheered Pascal, who dearly loved children.

He had an old female servant, who had lived in his house and served him faithfully for many years. One morning she entered his room before the hour when Madame Perier generally came, and withdrawing the curtains, she gazed sorrowfully on the wasted form and hectic cheek of her beloved master.

'How do you feel to-day, sir?'

'Not well, Cecile; I passed a sleepless night; but I had sweet thoughts, which comforted me.'

The old woman proceeded to arrange the room, and her master said—'Where is little George, Cecile? I have not heard his merry voice this morning.'

'Oh, sir, I wanted to tell you about him, and still, seeing you so poorly, I did not know how to do it; for I'm afraid it will flurry you so.'

'Speak, speak, Cecile! What has happened the child?'

'Oh nothing, sir; but all yesterday he was very dull and heavy, and would not eat: his father watched him all night, and early this morning brought the doctor to see him, and he says the child has got the small-pox; and when I asked him if he could not be removed to another house, he said it would risk the boy's life to do so. However, I'm sure I don't know what we're to do; for we could not endanger Madame Perier and her darling children for the sake of a beggar's brat.'

Pascal thought for a moment. 'No, Cecile,' he said, 'their health must not be risked, nor shall poor little George be removed. I will go to my sister's: I know her rooms are all occupied, but I am sure she will spare a small one, good enough for me during the short time I shall want it.'

Madame Perier soon came, and the arrangement was made according to his wishes. After providing amply for the comfort of the sick boy and his father, he left his quiet house and airy apartment, never to return thither again. With much pain, and suffering greatly from exhaustion, he was borne to his sister's house. There, on the 19th of August 1662, at the age of thirty-nine years, the gentle and holy spirit of Blaise Pascal returned to Him who gave it, leaving to the world a name which will live as the representative of splendid talents, united to self-denying benevolence and ardent piety.

AN ECCENTRIC LADY OF THE LAST CENTURY.

The Literary Gazette gives a memoir of a very extraordinary person, whom we do not remember to have before seen noticed in print—Mrs Jane Luson, who died at her house, No. 9 Cold Bath Square, Clerkenwell, in 1816, aged 116 years. The husband of this ancient dame was a relation of Oliver Cromwell: he died in 1766, leaving her in possession of a large fortune, upon which she afterwards lived in a liberal, but highly eccentric manner. It appears that she was of kind dispositions, yet extremely self-willed and imperious. Except one or two old friends, who were admitted at stated times, she saw no company, but spent her time partly in walking (confining herself to her garden) and reading, and partly in attending to the wants of a number of cats and other pet animals. Her single servant, who grew old in her service, sat in the same room with her, but always at a separate table, and under strong injunctions to treat her with strict etiquette, and address her as your ladyship. Her house was furnished in an antique style, and was full of old china. Although nominally a member of the church of England, and thought to be not deficient in religious feelings, it was part of her eccentricity never to go to church.

On evenings, this quaint specimen of a former age 'was always dressed in her most elegant attire, and would say that company were coming: though it was with the greatest reluctance that she admitted even her most intimate friend to the brilliant apartment. The fact is, that all this was done in order to assist imagination and memory in recalling those times which she loved chiefly to contemplate, when she was in reality in the midst of splendid assemblies, with all the votaries of rank and fashion around her. Action was not wanting to suit the scenery in the drama thus represented. For a while she would sit down musing in her chair, and then begin a conversation, answering herself in a feigned voice. Her questions were often addressed, or her salutations given, to persons once of the first emi-

nence in the political and fashionable world, but who had been long dead, and their names recorded in history for the good or evil they had done while living; and as they belonged to another generation, the present never imagined that one still existed who had been among them personally. All the famous toasts and beauties of the past age were likewise summoned round her, many, nay most, of whom and whose celebrity were forgotten by all but her. She and her sister had been famous in their day amongst these, and were frequently acknowledged leaders in the realms of taste and fashion. These imaginary conversations would sometimes last a long time.'

Mrs Luson was fond of dress, and possessed a large collection of old apparel. One of her favourite dresses had belonged to Cromwell's wife; another to his daughter, Lady Falconberg, being the dress in which that lady had walked at the coronation of James II. Mrs Luson 'had also those which Cromwell's daughters wore on a day of particular rejoicing, when the articles of peace were signed between the states of England and Holland in 1655-6. One of these dresses was valued at nearly 500 guineas. Added to all these, were the costly and splendid specimens that comprised her own particular wardrobe; these she often reviewed with particular pleasure, and has been known to boast that they once exceeded in number the days of the year. Many of the most expensive she had not worn for years; but they were regularly once a month, or oftener, taken out of the large mahogany coffers in which she kept them, aired, and carefully enclosed again in flannel wrappers. In the middle of the night she would sometimes call up her servant to give directions about the alteration in a gown, or the padding of a pair of stays: her favourite pair had been altered, quilted, and padded so often, that they were nearly three inches thick, and actually weighed more than a dozen pounds! Over these, in the afternoon, she would put on a single gown; but in the morning she sometimes wore three or four gowns at once. When indisposed (which indeed was not often), she would give orders respecting alterations in some particular dress; and, sitting up in her bed, she would put it on, dress her hair, and ordering the glass to be brought, admire herself for hours in that situation. Her head-gear was in the same style of antiquity as her other habiliments; it was a *tete* (such as had once been fashionable, and which she never laid aside) formed of dark hair, and nearly sixteen inches high; she wore it regularly powdered, and her friends have affirmed that it became her admirably. She had the greatest antipathy to soap and water, never washing herself, but using a cosmetic, the composition of her mother, from whom she learned to prepare it, and which was composed of the finest mutton suet clarified, with the addition of some emollients and perfumes, the particulars of which were her own secret. As the colour of her cheek decayed, she sought to supply its faded bloom with a more injurious composition, using an immoderate quantity of paint, which, destroying her complexion entirely, left her at length a singular spectacle, erasing from the placid dignity of age every line of its venerable beauty.'

For the last seven or eight years of her life, this venerable gentlewoman commonly rose at two o'clock in the morning. 'If she happened to lie later, she would observe to her servant, "I have been a very idle girl this morning." Large fires were generally kept burning day and night throughout the year; and some of the ancient stoves were so large, that they contained a bushel and a half of coal each. Soon after she rose, she had her breakfast of tea; and between it and dinner-time she would have four or five other breakfasts served, partaking moderately of each, and drinking nothing but tea; for during the whole course of her long life she only partook of coffee once, and frequently afterwards declared that had she only drank it for one week together, it would have occasioned her death. As regarded more substantial fare, she had a most extraordinary choice of dishes, one of which was sausages and boiled and stewed turnips. On the 30th of January she always adhered to Mr Luson's political custom of having a calf's head, in ridicule of the royal decapitation: in her case, however, it was nothing more than a cherished memorial of the habits of her deceased husband. She was undoubtedly the last who practised this long popular custom. She had also other particular dishes on certain days; and in the course of her diurnal repasts, she used each apartment of her house alternately. The entrance-doors of her residence were plated with iron, and further secured by nearly twenty bolts and bars, so fearful was she of being attacked by thieves—an occurrence which her numerous precautions rendered almost impossible.'

She was one of those rare and marvellous persons who never have a day's bad health, and whether as a cause or effect thereof, it is equally remarkable that she never took medicine nor required a doctor. She at last died gently, and without pain, from mere decay of nature.

[While referring to the *Literary Gazette* for the complete paper on Mrs Luson, we have much pleasure in adverting to the promising change which this publication has undergone at the beginning of the present year—being now one-half larger at one-half the price. This is a right concession to the spirit of the time; and we earnestly trust it will be successful to the end contemplated by the proprietors.]

SILICIFIED FOREST IN THE DESERT.

Dr Buist, of Bombay, lately laid before the Literary and Philosophical Association of St Andrews an account of that extraordinary and little known wonder, the petrified forest near Cairo. Proceeding from that city in a south-east direction, the traveller passes for five miles 'along an arid valley, through which a river torrent appeared to have flowed, skirted on both sides by low, brown, rocky ridges. He then turns suddenly off to the right, and beyond the first range of sand-hills, finds, spreading far as the eye can reach, a vast expanse of rolling hillocks, covered with prostrate trees. At first sight, these wear exactly the aspect of rotten wood dug out from a Scottish or Irish peat-bog. The colour and the amount of decay seem the same. They are lying in all positions and directions on the surface of the burning sand—some forty or fifty feet in length, and one or two feet in thickness; not continuous or entire, but in a line broken across, left in their places like sawn trunks. On touching them, instead of proving mouldering and decayed, they turn out to be hard, and sharp as flints. They ring like cast-iron, strike fire with steel, and scratch glass. The sap-vessels and medullary rays, the very bark and marks of worms and insects, and even the spiral vessels, remain entire; the minutest fibres of the vegetable structure are discernible by the microscope. By what chemical process has this transformation been brought around? Here you have the carbon—the most indestructible matter known to us—entirely withdrawn, and substituted in its place a mass of silica, a matter insoluble by any ordinary agent, and at any common heat. Yet so tranquilly has the exchange been accomplished, that not one atom has been disturbed; the finest tissues remain entire—the most delicate arrangements uninterfered with. The limits of the petrified forest are unknown; it probably extends over an area of many hundreds, perhaps thousands of miles. It has never been described with any care; and, extraordinary as it is, has excited very little attention. The trees are scattered loosely and at intervals over the desert all the way from Cairo to Suez, a distance of eighty-six miles. No theory of their silicification or appearance where they are found has ever been attempted. The trees seemed to have been petrified as they lay; they looked "like a forest felled by mighty winds." A further mystery was this: they lay on the surface of bare drift sand and gravel, and reposing on limestone rocks of the most recent tertiary formation—the texture and colour of the imbedded oyster-shells were as fresh and pure as if brought not six weeks from the sea.' Along with his paper, Dr Buist presented specimens of the silicified wood—roots, knots, and branches, from three inches to three feet in length. Some were exhibited sliced and transparent, showing the sap-vessels and medullary rays; some cut into bracelets and brooches. It appears there are similar prostrated and petrified forests in Scinde, resting on the same (tertiary) formation, on the coast of Coromandel, in all parts of Australia, in Antigua, in Ireland, and in numberless places up and down the world.

Dr Buist, on the same occasion, adverted to the nummulite limestone formation, which extends through a large portion of Northern Africa and Southern Asia, including Arabia. 'In the desert,' he said, 'it has the appearance of having been perforated everywhere by the pholades, or some other variety of marine borers. That this was no fanciful theory, was proved by a specimen struck off the rock at the citadel of Grand Cairo, where the borings were protected by an infiltration of siliceous matter, presenting, when this was cleared away, exactly the appearance of the recent perforations of the pholades on our shores. The

whole desert is manifestly one of the most recent of our upheavals. The cliffs, eminences, and mountains along the Arabian shore present the appearance of very recent elevation—the flat or sloping sea-beach, sands, &c. having risen along with the prominences, at the base of which it was deposited at the depths of the sea. These sweeping expanses of flat sea-sand, where there is little or no discernible tide, and no loose material to furnish drift, strike the spectator at once as ascribable only to submarine elevation. Near Suez, the gravel is full of shells identical with those now existing in the Red Sea.'

PLEASANTRIES.

A QUIZ UPON YOUNG IRELAND.

'Returned from Salisbury?' cried Moore to Mac Morris, as the latter stalked into Mr Bompas's chambers on the third day after the dinner party in Bryanstone Square, every detail of his dress exhibiting a true Jacobinical contempt for order. 'This moment returned,' answered Mac Morris, shaking the Saxon dust from his Celtic curls. 'Seen Stonehenge?' asked Moore at random. 'I went down for that purpose.' 'Oh!—a sudden paroxysm of antiquarian curiosity?—*Curius* incomptis capillis. The pun is irresistible, seeing the disorganised state of your tresses. But Stonehenge, I believe, is interesting?' 'Intensely!' 'I am happy that at length you have found something English to admire.' 'Stonehenge is not English,' said Mac Morris drily, arranging his hair as he spoke in a triangular fragment of looking-glass, which had the advantage over a common mirror of possessing the property of refracting light in as high a degree as the power of reflecting it. 'Stonehenge not English!' repeated Moore. 'What do you mean?' 'It is ours!' said Mac Morris, in his coolest way of advancing the most daring propositions. 'Ours! I don't understand you—the work of Irish Druids, I suppose?' 'Not at all. Ours, I mean, as the Round Towers are ours—as St Patrick's purgatory is ours—as much as the Hill of Howth or the Rock of Cashel is ours.' Dominick looked at his Celtic friend with a twinkling eye and a gentle biting of his under lip; as men look at their companions mounting their hobbies or hippogrifs. Tigernach continued—'You know, Moore, I am fearless of ridicule: it is the test of truth.' 'From which you infer, I presume,' answered Moore, 'that the more a proposition is ridiculous, the more it should command my respectful attention? But tell me your tale of Stonehenge—I shall listen with becoming gravity.' 'There is nothing new in the tale of Stonehenge; you will find it in Campion's Historie, and more in detail in Dr Hanmer's Chronicle. Aurelius Ambrosius, king of Britain, at the head of a gang of English adventurers, stole the monument from the Curragh of Kildare, and pitched it in Salisbury Plain.' 'They were lusty robbers. What was the king of Leinster about? Why did not the Lagenians defend their monuments?' 'The English were aided by enchantment; the expedition was advised by Merlin, the famous wizard.' 'No wonder they stole our parliament, Mac Morris, when we could not even keep our Stonehenge. The stones are enormous, are they not?' 'They are.' 'Really, Mac Morris, I should think that the less we say about the loss of Stonehenge the better for our reputation: people will not believe in magic in these days; so the story, if true, will only prove what thews and sinews King Ambrosius had, and what poltroons our countrymen were at the period of the great larceny in question—far greater than that of the church bells of Notre Dame by Gargantua the Great. You must have felt mortified and ashamed as you surveyed the huge memorials of our national pusillanimity?' 'True! I felt as I feel when I contemplate the Union.' 'Yes, but you say the Union can be repealed?' 'Ay!—and I say, too, that Stonehenge can be and shall be retaken.' 'Stonehenge retaken! What if the Saxons defend their spoil better than the Irish defended their property? Do you depend upon magic?' 'On the magic of youth and determination.' 'But you will first make your demand?' 'It shall be my first step in the Hall of Clamour.' 'And a *pas de geant* it will be: you will be considered as great a wizard as Merlin himself. How fortunate that O'Connell never thought of the Stonehenge question! He fancies that he has left no stone unturned, and he has left the biggest of all for you—the stones of Salisbury Plain.' 'If the thought had occurred to O'Connell, he would have taken it by instalments, at the rate of a stone in a century. Young Ireland repudiates the base principle.'—*The Falcon Family.*

A FINE OLD ENGLISH YEOMAN.

Old Richard Gubbins lived in the west country, and very much relies the opinion of a learned sergeant, that the further you go west, the more you are persuaded that wise men come from the east. Some years ago he married his only daughter to a rich tradesman, living in Milsom Street, Bath, to which city he frequently went; and happening once to meet each other on the coach, we went together, and were much pleased with the journey. Richard was particularly pleased with black horses, with their tuckled-up tails; and frequently expressed his conviction that the old four-wheel was the best possible conveyance that could or ever would be had. I remember how he admired the pulling-up at Dunkerton Hill, myself sitting on the box, and he just behind me, with his knees on each side of me, forming a not very comfortable sort of arm-chair. Last fall I called on Richard; and, after talking to him of the hardness of the times, and the distress of the farmers and other classes, I complained to him that we had never met on the road lately. Richard drew rather a heavy respiration, and said, 'The road, sir? It was a very pleasant thing, but there's no coaching to Bath now; and I cannot stand a private conveyance, nor anything of that sort, not being a very rich man.' I said it was true there were no coaches, and ventured to suggest the railway. I told him that not only might he get to Bath, but that, by leaving in the morning, he would be up there in time to have dinner with his daughter, instead of being seven hours on the road. That moment I saw I had suggested an unfortunate topic. 'Sir,' said he, 'do you suppose that, after having lived like an honest man for seventy-five years, and after having been upon the coach so often, I would submit to be drawn behind a smoke-box?' He asked also what sort of company I had kept, to talk of such a subject in his house; and concluded by saying—'Remember, there is no politics here; it is the rule of the house. Suggestions for travelling on railways may do very well for manufacturers and radicals, but not for Richard Gubbins, nor any of his kin.'—*Speech of Mr Bickham Escott, at Taunton.*

MELTING MOMENTS.

One winter evening a country storekeeper, in the Mountain state, was about closing his doors for the night; and while standing in the snow outside, putting up his window-shutters, he saw through the glass a lounging worthless fellow within take a pound of fresh butter from the shelf, and hastily conceal it in his hat. 'Stay, Seth,' said the storekeeper, coming in and closing the door after him, slapping his hands over his shoulders, and stamping the snow off his shoes. Seth had his hand upon the door, and his hat upon his head, and the roll of new butter in his hat, anxious to make his exit as soon as possible. 'I say, Seth, sit down: I reckon now, on such a night, a little something warm wouldn't hurt a fellow. Come, sit down.' Seth felt very uncertain; he had the butter, and was exceedingly anxious to be off, but the temptation of 'something warm' sadly interfered with his resolution to go. This hesitation, however, was soon settled by the rightful owner of the butter taking Seth by the shoulders and planting him upon a seat close to the stove, where he was in such a manner cornered in by barrels and boxes, that while the country grocer sat before him, there was no possibility of his getting out; and right in this place sure enough the storekeeper sat down. 'Seth, we'll have a little warm Santa Cruz,' said the Green Mountain grocer, as he opened the stove door, and stuffed in as many sticks as the space would admit. 'Without it you'd freeze going home such a night as this.' Seth already felt the butter settling down closer to his hair, and jumped up, declaring he must go. 'Not till you have something warm, Seth. Come, I've got a story to tell you; sit down now;' and Seth was again put into his seat by his cunning tormentor. 'Oh, it's confounded hot here,' said the thief, again attempting to rise. 'Sit down; don't be in such a plaguy hurry,' retorted the grocer, pushing him back into the chair. 'But I've got the cows to fodder, and some wood to split, and I must be agoing,' continued the persecuted chap. 'But you mustn't tear yourself away in this manner. Sit down; let the cows take care of themselves, and keep yourself cool. you appear to be fidgetty,' said the roguish grocer with a wicked leer. The next thing was the production of two smoking glasses of hot rum-toddy, the very sight of which, in Seth's present situation, would have made the hair stand erect on his head, had it not been well oiled and kept down by the butter. 'Seth, I'll give you a toast now, and you can butter it yourself,' said the grocer; yet with an air of such consummate simplicity, that poor Seth still believed himself unsuspected. 'Seth, here's a Christmas goose (it was about Christmas time)—here's a Christmas goose well roasted and basted, eh? I tell you, Seth, it's the greatest eating in creation. And, Seth, don't you never use common cooking butter to baste with? Fresh pound butter, just the same as you see on that shelf yonder, is the only proper thing in nature to baste a goose with. Come, take your butter; I mean, Seth, take your toddy.' Poor Seth now began to smoke as well as to melt, and his mouth was as hermetically sealed up as though he had been born dumb. Streak after streak of the butter came pouring from under his hat, and his handkerchief was already soaked with the overflow. 'Dreadful cold night this!' said the grocer. 'Why, Seth, you seem warm. Why don't you take your hat off? Here, let me put your hat away.' 'No,' exclaimed poor Seth at last, with a spasmodic effort to get his tongue loose, and clapping both hands upon his hat—'No, I must go; let me out. I ain't well; let me go.' A cataract was now pouring down the fellow's face, soaking his clothes, and sliding down his body into his very boots, so that he was literally in a perfect bath of oil. 'Well, good night, Seth, if you will go,' said the humorous Vermonter; adding, as Seth got into the road, 'Neighbour, I reckon the fun I have had out of you is worth ninepence, so I shan't charge you for that pound of butter.—*New Orleans Picayenna.*

PLEASURES OF RAILWAY TRAVELLING.

Let us fancy a man timid, and unused to locomotion, who has perhaps been diverting his morning with newspaper accounts of railway accidents, arriving in the evening at the great terminus at Euston Square, bound on a nocturnal trip to Birmingham or Liverpool. Passing under an entrance as colossal and imposing as an Egyptian temple, he is hurried through the darkness to a spot which almost realises the description of the hall of Eblis. Long colonnades of iron pillars support an iron roof, the intricate tracery

of which fades away in gloom, while below rows of brilliant gas-lamps bewilder his suddenly-expanded vision. Passengers more accustomed to the voyage than himself knock him about in their anxiety to secure their own places. Anon, porters pushing huge trucks come rattling down, and it requires all his activity to attend to the polite 'Make way, if you please, sir,' which attacks him on every side. When sufficiently acquainted with the place to find out an undisturbed spot for observation, he timidly glances out into the gloomy abyss which stretches away from the platform, and then his terrors will surely reach their climax. Great huge things, like fiery dragons, prowl about—growling, blowing, panting, vomiting smoke and flame, and looking as if they had the will and the power to swallow up the train in which he is about to trust himself, passengers and all. Suddenly the bell rings, and our timid friend rushes to his carriage, thinking all the while of Mr Huskisson's fate, and tumbles affrighted into a most commodious receptacle, where he finds, to his surprise, gentle young ladies composedly reading novels, and knowing ones of the rougher sex elaborately arranging their nightcaps. He has selected the middle carriage for safety, and now, if possible, he secures the middle seat in *that*. If he has a fat fellow-passenger on each side, and another in front, he feels somewhat reassured, and commences some ingenious mental calculations as to what extent his fat lateral friends may act as cushions should the train go off the rails, or in how far the elasticity of his portly *vis-à-vis* stomach might constitute it an effectual 'buffer' for his head in the awful event of a collision. Another bell rings, and away they go at a pace which would leave the wild huntsman 'nowhere;' and our timid traveller clings to his seat as comfortable as if perched on a cask of gunpowder with a lighted cigar in his mouth. But a man can sleep even on the night before he is hanged. Our friend slumbers off, lulled by the placid, contented snoring of one of his *compagnons de voyage*, when suddenly a wild unearthly scream breaks upon his ear; he starts up, convulsively exclaiming, 'What's that?' and narrowly escapes a cut nose in his hurry to poke his head out of the window. The scream is repeated louder and shriller, and his fears throw off all restraint. He shakes the arm of one of the sleepers, wonders how he *can* sleep under such circumstances, and repeats his 'What's that?' in eager and fear-impressed accents. The sleeper—some old commercial traveller, who can sleep anywhere—slowly rubs his eyes, gazes mechanically at the questioner, takes his guide-book out of his pocket, and having referred to it, mutters the cabalistic word 'Tring,' or 'Watford,' or 'Wolverton,' and composes himself again to sleep. If it be the last-named place, our timid traveller has a gleam of comfort. He is allowed five minutes on *terra firma*, and quickly descending from his prison, he rushes into the refreshment-room, where, to save time, the coffee is kept boiling hot for the accommodation of mail and express train visitors. He has had hardly time to scald his lips with the first mouthful, when another bell rings, and he runs away to look for his carriage. Of course he has not taken notice of the number, and therefore runs about in wild dismay, at every door he looks in seeing strange faces and unrecognisable greatcoats, and at last finds his own seat, just as the leviathan begins slowly to move away from the station. Then comes the dark tunnel with all its horrors. The merry rumble of the train in the open air is changed for a sullen subterranean roar; the timid traveller looks out, and sees close to his face a slimy brick wall, while his memory reverts to the catacombs of Paris, and the skeleton which was found sitting bolt upright in the main sewer of Fleet Street. He wonders how he should feel if the whole superincumbent mass of earth were suddenly to settle down upon him and his fellow-passengers; and when he again emerges into upper air, he feels as if he had just escaped a most dreadful peril. His fellow-travellers, who have by this time slept enough, brighten up, and beginning to find out their man, are most obliging in providing pabulum for his terrors. One describes a 'smash' in which he was himself nearly killed; while another innocently says that they are just then approaching a most dangerous curve or steep embankment. Thus the timid traveller is kept continually on the tenter-hooks as he drives through tunnels, or flies over embankments or viaducts, until at last he arrives, sound in body, but much distracted in mind, at the place of his ultimate destination.—*Railway Record.*

STEADINESS OF MEAN TEMPERATURE.

The climate of the same place, notwithstanding perpetual and apparently irregular changes, possesses remarkable steadiness; as, for instance, the mean annual temperature of London is about 50·4 degrees. In the year 1788, the cold was so unusually severe, that the Thames was passable on the ice, and yet the mean temperature of that year was 50·6 degrees; within a small fraction of a degree of the standard. In 1796, when, it is said, the greatest cold ever observed in London occurred, the mean annual temperature was 50·1 degrees. In the severe winter of 1813–1814, when the Thames and other large rivers of England were completely frozen over, the mean temperature of the two years was 49 degrees, being little more than one degree below the standard. And in the year 1808, when the summer was so hot that the temperature in London was as high as 93·5 degrees, the mean temperature of the year was 50·5 degrees.—*Daniell's Meteorology.*

IMITATIONS OF THE OLD POETS.

NO. I.

THE CROPPED FLOWER.

Go, lovely flower!
Tell her who fills my every thought,
That from the hour
When first across my path was brought
That gentle form,
My soul no other idol sought
From night till morn.

Go quickly, go,
And let thy modest blushes speak;
Though now you blow,
Too soon thou'rt doomed by winter bleak
To fade and perish;
Thus vanisheth all hope would make
Me love and cherish.

And tell her too,
As morning's beam doth kiss away
The tears of dew
Which thou hast wept since yesterday,
When thy god set—
So doth her smile send forth a ray
To cheer me yet.

But go, fair flower!
No longer by the winding lee,
In mossy bower,
At early dawn thy god thou'lt see;
He's set for ever,
As is my deity to me,
To rise, oh never!

Then droop and fade;
Thy god still shines as warm and bright
O'er lawn and mead;
And other flowers shall woo his light
In sunny hour,
But none so true from morn till night
As thou, poor flower!

J. O. B.

MATERNAL TUITION.

No man can sympathise with a child's feelings so truly, so intimately, as woman; he is deficient in the kindness which in her overflows: from her heart she pours out nourishment to the infant mind, which man's intellect in vain attempts to supply. No education, from which the mother virtually or actually is excluded, can suffice and satisfy; no education can be normal in which woman has no part; for without her, though the understanding may be brought out, the will which yields not to hard and harsh motives, but to soft and inviting spontaneities—which does not and cannot respond to mere intellectual teaching, but answers only to sympathetic persuasions—must remain comparatively dormant. Christian morals taught by female lips cease to be syllogistic disputations, and become at once living principles, receiving illustration not only in the pictures of fancy, and the moving shapes of strong imagination, but in the affectionate reality, true loving-kindness, good-will and wellbeing, which live in woman.—*Herauld's Essay on Education.*

VALUE OF CONVERSATION.

Conversation is the most delightful method of gaining knowledge. What is more invaluable than an accomplished companion, a living volume reading its own pages? What an intellectual treat it is to talk with one 'with whom conversing we forget all time!' It is worth much to read the lessons of a philosopher, but to hear him impart them is worth much more. It is agreeable to read the narration of a traveller, but far more so to hear him describe what he has seen. Besides, there is the opportunity of asking questions, and skill in interrogation is one of the chief excellences of an apt converser. Lord Bacon has truly said, 'He that questioneth much shall learn much, and content much; but especially if he apply his questions to the skill of the person whom he asketh; for he shall give them occasion to please themselves in speaking, and himself shall continually gather knowledge.'—*Lecture on Self-Culture.*

AN ESSAY ON ADVERSITY, WITH INTERJECTIONS BY A READER.

Adversity!—daughter of Jove—relentless Power—tamer of the human breast—companion and nurse of Virtue—such are the terms in which a philosophical poet has spoken of it. In similar language have almost all the poets and philosophers of all ages eulogised adversity; without which, some of them say, it is impossible for any one to know what sterling qualities he may possess, or what great things he may accomplish. [A very good thing for all people besides ourselves, I suppose.] To see a brave man, says Seneca, struggling against evil fortune—

'Still buoyant 'midst the waves of adverse fate'—

is the finest sight the world can show. The gods might be expected to look down with satisfaction on such a spectacle. [All very true perhaps; but this is apparently a drama which would expire for want of actors, if men had their own choice.]

The corrupting tendency of prosperity has always been fully acknowledged. Men are then apt to be extremely puffed up and forgetful of themselves. They begin to look on their fellow-creatures as beings of an inferior nature, whom they are at liberty to use for their own purposes. Old friends are forgotten; nay, even those who may have conferred benefits upon them in their less fortunate days. Often, in the wantonness of prosperity, men will trample the most sacred principles under foot. In short, it has ever been regarded as a most dangerous thing for a frail mortal to be exposed to the demoralising influences which attend a large measure of the good things of this life. [All nonsense. I know many good fellows who have feathered their nests by railway speculations. They never used to give dinners, because they said they could not afford it. Now, they ask you every fortnight. Forget old friends! They never could remember them till now. And as for trampling sacred principles under foot—why, you will see their names opposite good sums in all the charity books that go about—fellows that never gave a halfpenny to a beggar before. I would like to be exposed to similar danger—that I know.]

The enervating effect of prosperity is perhaps its most remarkable result. Under this sickly influence, all the hardy virtues languish and die. Adversity, on the contrary, developes the native vigour of human character. [Well, I know that Jasper Thoroughpace was a clever active fellow while things were going well with him; but now that he is in the background, one would think he had lost all spirit, and had resolved to allow the world to take its own course with him—like a Turk. I called upon him the other morning, and showed him how he might make thirty pounds in a couple of days if he would only look sharp. But he told me it was of no use—he had not heart to try anything.] Yield not to evils, said the Sybil, but go the more daringly against them. You vanquish fortune by bearing her spite with fortitude. How nobly did the ancients practise these admirable maxims of theirs, and what a noble example have they thus left to us! [A set of ninnies, that fell on their swords whenever anything went wrong. No, no, my friend; depend on it, it's all talk about the invigorating effect of adversity. As well tell me that crocuses thrive because of the snow they grow amongst, when we know it is only by reason of such sunshine as there is at that season that they can get up their heads at all.]

Perhaps, however, the most blessed result of adversity is in its softening effects upon our nature. From my own, I learn to melt at others' wo, saith the poet not more beautifully than truly. Amidst the luxuries and blandishments which prosperity brings us, we unavoidably become selfish and egotistical. The spirit grows upon us, till we become thoroughly hardened. But let us experience the frowns of adversity, and we feel at once that we are men. Our vexations and griefs teach us what human life really is to the great bulk of our fellow-creatures, and we then begin to open our ears to the cry of the poor and the anguish-laden. Thus it has happened to many a man to be converted into humanity by adversity, who would otherwise have gone on to the close of life in impenetrable selfishness—selfishness all the greater, that he was totally unconscious of there being any such thing about him. [Now, such nonsense is here! Why, the very contrary is the case. There is Mrs Craik, the nicest creature in the world as long as her husband was in easy circumstances—felt for everybody, and helped all she could—never seemed to have a selfish thought. But now that Craik has fallen back so much, why, she is no longer endurable. Last time I went to see her, she talked of nothing but the slights she meets with from old acquaintances, and what she suffers from her husband's bad temper. She is now bitter at everything. Call you this egotism or not? And she really is a good creature too. It is only that she has so much to annoy her own mind, that she can think of nothing else, much less feel for any other body's troubles. And is this an uncommon case? Have you never heard of people being soured by misfortune, getting spited at the world when it goes against them, and so forth? Men are hardened, my dear friend, not by prosperity, but by adversity.]

While thus serviceable in disciplining the feelings, adversity has a scarcely less important power as an instructor of the judgment. In prosperity, we see everything through a false medium. The world smiles upon us, because fortune does. We never learn the real

thoughts of those around us. Men have an interest in deceiving us, and we can hardly miss being deceived accordingly. But, while abiding the storms of adversity, we have all things presented to us in the unflattering reality. We see the selfishness, if not heartlessness of men, and how little even genuine merit affects them, if they do not think they can make something by it. We learn to avoid taking things at their first fair seeming; to pause, look narrowly, and approve late. We learn to cope with the most astute in all worldly matters. From these considerations it is that the diplomas of those reared in the school of adversity have ever borne so much higher a value than those of persons brought up in pleasanter academies. Indeed, as an English poet has well expressed it, 'So many great illustrious spirits have conversed with Wo, and been taught in her school, as are enough to consecrate distress, and make ambition wish for the frown rather than the smile of fortune.' [Stuff, stuff—nothing but stuff! Adversity only twists people's judgments. In that school they do not see things in their true character, but in a very false one. Everything appears harsh and disagreeable to the man suffering adversity. If a merchant, in struggling circumstances, and refused a little credit, he thinks there is no faith in human probity, and goes home as sulky as a bear. If a commander, who has failed in an enterprise, he conceives every allusion in his presence to military failures a symptom of the ungenerous spirit of detraction in his fellow-creatures, and is like to fall into a duelling business every day of his life. Who has the justest opinion of critics—the author whose works get a fair share of the praise which they deserve, or he who, writing bad books, is continually cut up in the reviews? Oh, my friend, look a little amongst those who are called the suffering classes, and say if actual observation makes good these dreams of yours about the stern schoolmistress. Tell us if you there find juster views of life and its complicated interests, than among the quiet well-off people of the middle ranks, or even those who have suffered a little too much of prosperity. Tell us whether demagogues find their best subjects amongst those who have empty, or those who have full bellies. But I have lost all patience with this twaddle about the beauties of adversity, and can listen to no more of it.] *Exit reader in a huff, after throwing the book from him with contempt.*

Gentle readers of my own, this is a representation of the spirit of ancient writers in contrast with that of modern readers. Adversity is one of the respectabilities of past literature. It was the fashion for twenty centuries to expatiate upon the useful effects it had upon human character, and no one ever thought of challenging this philosophy, although then, perhaps, adversity's own patients were as uneasy under her surgery as now. But it is no longer possible to pass off plausible commonplaces in this way. Men make no allowance for the solemnities of authorcraft. They look at things in a practical light only, and if they find literature attempting to impose anything upon them contrary to what they may see in the next street they pass through, or the next house they enter, they abide it not.

Addressing myself to the immediate question, I would say (were I asked my opinion) that there is a measure of truth on both sides, though mostly on one. The effects of both prosperity and adversity depend much on the particular character of the person exposed to their influence. Some are naturally liable to be corrupted by prosperity, and to be corrected by reverses; and this gives countenance to that laudation of adversity which poets and philosophers have good-naturedly proclaimed as a kind of consolation for suffering mortals in all ages. But it would be belying nearly the whole system of human desires and motives, if we could not say that, in the large majority of cases, prosperity has a softening and a generally improving effect, and adversity the reverse. The latter can only be honestly regarded *as mainly and* in most instances a positive evil. Bear it resignedly and virtuously; admire all examples of heroism under it; be unlimited in efforts to relieve its victims. But see it, at the same time, in its true character, and try by all honourable means to be prosperous—notwithstanding the poets.

RECENT REVELATIONS OF THE MICROSCOPE.

THE Manchester Guardian, with characteristic industry, gives ample reports of six lectures on the Microscope and its Revelations, delivered in the course of last December by Dr Carpenter, in the Royal Manchester Institution. They present a ready summary of the chief services which the microscope has of late years rendered to science. It appears that this instrument remained for two centuries in nearly its original state, but that, within the last twenty years, there have been great additions both to its powers and to its accuracy. The consequence has been, the accumulation of a vast quantity of curious facts regarding the minuter departments of the vegetable and animal kingdoms, and the ultimate structure of organic substances, including particularly that of shells, which has been Dr Carpenter's own department in the investigation. The instrument has also been brought to bear in a happy manner upon certain geological inquiries and speculations, into which it has been the unexpected means of introducing certainty where otherwise all was, and would have continued to be, doubtful. We would fain give our readers some idea of the importance to which the microscope is thus rising as a philosophical instrument, and we pitch for this purpose upon the geological investigations, as those likely to be the more novel to a large class of readers.

We may first explain that the geological investigations of the microscope proceed upon certain facts; first, that organic structures—that is, vegetable and animal matters—in their composition differ essentially from such as are inorganic, in as far as there is always some regularity of form discernible in them, when minutely observed; and second, that particular organic substances usually have certain peculiarities in this intimate structure, by which they may be distinguished one from another. Here, it must be observed, minute inspection is the all-important matter. Masses are often of no particular character to ordinary observation; they may be inorganic or organic for anything we can tell, judging merely by the naked eye. But when the least bit, properly prepared, is subjected to the microscope, we see features in it which at once determine the question. So also a mass may be known to be organic (a fossil); but we may not be able, from its external aspect, to say whether it is vegetable or animal, or to what order of plants or animals it has belonged: the microscopist, however—knowing that petrifaction, while changing the component material of the object, produces no change on its ultimate structure, or, as we might say, its architecture—proceeds with confidence to examine the mass in question, and, discerning the forms characteristic of certain classes of plants or animals, assigns it at once its proper place in organic nature. Such decisions are often of great consequence; for it not unfrequently happens that a scale, or a tooth, or a fragment of bone, is all that we possess of some fossil, the determination of whose character may be the only means of solving an important geological question.

Dr Carpenter states that, some months ago, he was applied to by Mr Darwin, the eminent naturalist, to ascertain, with regard to two extensive strata in North America, whether they were identical in materials. From the comminuted shells contained in both, Mr Darwin thought it likely they were identical; but he could not be sure. Dr Carpenter examined them microscopically, and 'was enabled to state, with almost perfect certainty

that the one formation was produced by the still further subdivision of the other; and that the two, so far as regarded their material, were identical.' He had also been referred to by Dr Falconer, the distinguished palæontologist of the Himalaya mountains, to pronounce on certain bodies he had found in a rock, when in search of organic remains, whether they were organic or inorganic. By microscopic examination, Dr Carpenter was enabled to determine that they were of the latter character, because he found their structure to be crystalline. Here a difficult point was settled at once, and satisfactorily.

On another occasion, Dr Falconer was at a loss to ascertain the nature of certain small bones which he had found in the Sivalik hills, near the remains of the twenty-feet-long tortoise which he was the means of discovering.* He was inclined to believe that they were the toe bones of some animal of the same species; but their form was not sufficiently characteristic to enable him to determine this with certainty. He placed them in the hands of Mr Quekitt, subcurator of the College of Surgeons, who has paid considerable attention to the microscopic structure of bones. Dr Falconer did not tell him what they were, or give him the least clue to his own opinion, but merely asked him to throw as much light upon the nature of the bones as he could. Mr Quekitt in due time gave notice that they were the bones of a reptile, and most probably of the turtle order; thus completely confirming the supposition which Dr Falconer had formed from other evidence.

The principal substance of the teeth in almost all animals is one called *dentin*, characterised by minute tubular passages permeating it in a direction from the centre to the circumference. 'Considerable variation in the arrangement of these tubuli was found in different groups of animals, which enabled us to determine with great precision, by the inspection of even small fragments of ivory, the animal to which the tooth belonged. Dr Carpenter then showed a section of the tooth of the great megatherium, one of the gigantic fossil sloths, which were to the sloths at present existing in South America like what an elephant is to a sheep. That tooth, like the front teeth of rats and other rodentia, was always growing from a pulp at the base, thus making up for the gradual wearing of the surface from the want of enamel. The dentin or ivory in these teeth was peculiar in this, that it was entirely destitute of the small canals. There was one great central cavity, from which various canals passed out over the internal portion of the ivory; and there was no doubt, from their general appearance, that in these canals there had been blood-vessels in the living animal. External to this layer was a layer of ordinary, or non-vascular ivory; and external to this was the *crusta petrosa*, which corresponded very closely with the substance of bone. This was precisely the substance of the teeth of the sloth at the present time, except that they had not the vascularity of the internal portion of the dentin; and they were made up of dentin and an external layer of cementum, without any enamel. Teeth formed upon this plan would not be enabled to grind down any very hard vegetable substance; and the sloth lived now upon the soft shoots of trees, &c. It was formerly supposed that the megatherium, the milodon, and other sloth-like animals, burrowed in the ground, and perhaps fed upon the roots of trees, which they met with in digging the soil. This view seemed borne out, too, by the fact, that it would be impossible for any tree to support the enormous weight of these animals. They could not climb a tree, as did the sloth at the present time, and find subsistence upon its branches. But the structure of their teeth was investigated by Professor Owen, and his discovery went in complete opposition to such an idea. It was shown that these teeth could not, by any possibility, grind down the hard roots of trees; that they were not formed at all upon the same plan as the teeth of beavers, and other animals which fed upon hard vegetable substances, and which had not only enamel present, but enamel arranged in plates upon the substance of the teeth in such a manner as, by the equal wear of the dentin, cementum, and enamel, produced a constantly rough surface upon the crown of the grinding teeth. Nothing of this kind existed in the fossil sloth, and it was perfectly clear that that gigantic creature could not have existed upon the roots of trees; that it must have fed, in fact, upon the same kind of substances as the sloth of the present time. How did it get them? Could it climb trees? Certainly not. Reasoning upon these facts, then, and upon the habits of the animal, Professor Owen was led to work out a most curious train of investigation, which led to the most complete history of the habits of any fossil animal, differing so widely from the animals of the present time, that had been ever given to the world, from the material supplied by the anatomist. He had fully proved, as far as circumstantial evidence could prove, that the habits of the animal were these:—By its enormous digging fore-feet (for there was no question that they were organised for digging), it burrowed down and excavated beneath the roots of trees, and then, rearing itself up upon its hind-legs and tail, as upon a tripod, it pushed against the tree, swaying backwards and forwards until the tree fell; then it browsed upon the leaves and young shoots, until it had completely stripped them, when it went on to another: and the present sloth completely stripped one tree before it left it. Professor Owen had mentioned this circumstance to him (Dr Carpenter), as showing the confirmation which accident would sometimes give to elaborately worked-out views of this kind. He was explaining to Dr Buckland (the principal advocate for the theory that it ate roots) his views upon the subject, who said, that if this was the case, the animals would be very likely to be killed by the fall of the tree. Professor Owen replied, that their gigantic strength might possibly push the tree down in a direction from them, and that they would have sufficient instinct to get out of the way. But the very next specimen that was brought home from South America (at present in the museum of the Royal College of Surgeons, and which was worthy the inspection of every one the least interested in the subject), the skeleton of the great milodon, the most complete skeleton of this group, showed a very large fracture in the skull of the animal; not made at the time of fossilisation, or since, but a fracture which had been united and healed again. The fracture was one the animal must have received from such an accident as a tree falling upon its head; but being provided with a very thick skull, of which the brains did not form a very great portion, it thus escaped vital injury, and eventually led a long and active life subsequent to this blow. This corresponded most remarkably with the views Professor Owen had already suggested, in consequence of the determination of the microscopic observations of the teeth.'

The lecturer then adverted to another animal of the ancient world, one belonging to a still remoter era, and denominated, from certain extraordinary peculiarities in its teeth, the labyrinthidon. 'All must have heard, and many witnessed the fact, that the quarries at Stourton in Cheshire, and other quarries in the midland counties—Worcestershire and Warwickshire—had presented regular footmarks of an animal. He did not allude to the recent undetermined footsteps, but to discoveries some years ago of an animal which could only be referred to the group of batrachian reptiles or frogs, as no other animal was found which seemed to make such footprints. But the enormous size of the footmarks seemed to militate against the idea that it was possible for such an animal to have made the impress, for it would have required a frog three or four feet long to make such an impression, it being fully the size of the foot of an ostrich. Professor Owen received from some of the

* An account of this extraordinary animal is given in the second volume of the Journal, new series, p. 324.

Worcestershire and Warwickshire quarries several of the bones and teeth of this animal, and also some smaller teeth from Germany, which he was requested to examine. Upon making a section of the teeth, he found they were utterly dissimilar from anything he had elsewhere seen; and yet, when unravelling this complex structure, and searching for something corresponding with it in other groups, he was gradually led to perceive that the bones and teeth must belong to reptiles intermediate between the ordinary reptiles and fishes: one bone nearly approaching the ichthyosaurus, another the teeth of the lepidosteus [a sauroid fish, resembling the present bony pike], and one of the bones of the sword-fish. Other indications led him to perceive that teeth, and fragments of the jaws in which the teeth were imbedded, might have belonged to a batrachian reptile of the frog kind.' Thus the case was made out, and it was determined that the world, at the time of the deposition of the rock of the Warwickshire quarries, contained a frog-like animal of probably the size of a little bullock.

Dr Carpenter then alluded to his own investigations in determining the structure of the solid parts of animals allied to the star-fish and sea-urchin. The shell of the echinus, or sea-urchin, was found to be composed of a network of calcareous matter, sometimes forming a series of plates parallel to each other, and connected by little pillars proceeding from one surface to another. In the spines with which the animal is covered, this network had a most beautiful appearance. Upon showing the sections of these objects under the microscope to a friend engaged in the lace manufacture—Mr Heathcote, the member for Tiverton—that gentleman observed that he thought it would be a good pattern for lace. (It would not be the first time that objects in natural history had suggested patterns; for within a few weeks after the publication of a section of the teeth of the labyrinthidon, it was to be seen in the centre of a large handkerchief printed in Manchester.) The crinoids, or stone-lilies, were a fossil tribe of this order of animals, and their remains form a large part of many ancient strata. It was supposed by mineralogists that the fragments of these animals, where calcareous matter had been infiltrated to the complete displacement of the original matter, were crystalline in structure; but the lecturer had shown that they contained a characteristic and beautifully-preserved structure.

He had done the same with the shells of molluscs (common shell-fish), both ancient and modern. The hard parts of these animals are not mere masses of calcareous matter, as a piece of limestone is, but are distinguished each by some peculiarity of structure, which the microscope exhibits to us. Primarily, the shell of a molluscous animal is composed of cells of animal matter, in which are contained calcareous matter. In many cases these cells are of a prismatic form, and the internal matter takes its shape from the cells. By seeing, then, the smallest fragment of shell, or even a little of the calcareous dust left when the membrane was discharged from it, he could tell to what tribe of molluscs it had belonged. There is a family of bivalves, very prevalent in early ages, and still existing—the terebratulæ—which have a most peculiar structure, enabling the microscopist to determine them with ease. In this large group, two great divisions 'have been assigned by microscopic observation. One division is marked by a series of little dots on the surface, sometimes visible, although difficult to be seen by the naked eye, and sometimes requiring a strong magnifier to distinguish them. These dots are the orifices of canals which pass through the shell from one surface to the other. This was not known before the test of the microscope was applied. He showed a rough diagram of the thickness of one of these shells, and the canals passing nearly straight through, from surface to surface; sometimes they were found winding a little, but in many fossil species of the oolite they passed through direct. This distinction served to divide the very extensive genus, containing several hundred species, into two divisions; and previously, naturalists had been very much at a loss to obtain good characteristics for the division of the group. One division is characterised by the presence of these extraordinary perforations; the other by the absence of them. By the examination of the recent shell with the animal in it, he had made out, within the last few months, this very curious fact, which was quite unique in the history of the formation of shell, that in these tubes, passing to the external surface of the shell, there were glandular prolongations of the substance of the animal; that every one of the tubes contains a little gland connected with the mantle or skin lining the shell. It was evident, therefore, whatever might be the office of the glands (which was not determined), the presence or absence of these orifices in the shell must be regarded as of considerable importance. Suppose he took a shell not perforated, and scaling off the minutest fragment (which it was more easy to do than in the other division of terebratulæ), placed it under the microscope, the following curious structure would be observed:—It is made up of an excessive quantity of layers, each layer folded and folded upon itself; and this characteristic structure of these terebratulæ distinguished them from every other shell. The internal surface of the shell being ground away, tide-like markings were seen, laid one over another, which were, in fact, the extremities of these long folds, which crop out obliquely upon the internal surface of the shell; and these long folds, broken up into fragments, have at the termination of every one of them this long, tile-like, rounded form. This structure he had made out to be characteristic of that group, and to be confined exclusively to it; and therefore we are enabled to determine with precision, from the most minute fragment of the shell, the division of the group to which it belonged.'

In a future paper we may return to this subject, and take advantage of the Guardian's reports to give our readers some idea of the discoveries by the microscope in physiology.

FRAY CRISTOBAL.

A NARRATIVE OF THE REVOLUTIONARY WAR IN TEXAS.

BY PERCY B. ST JOHN.

Before the war which for many years filled with desolation and rapine the whole of Texas, colonisation was extending its beneficial influence into the very heart of the country. The untiring energy and perseverance of the Anglo-Saxon race were carrying the arts of peace and civilisation into the wilds; and in every district where wood, water, and fertile land tempted the adventurer, arose farms and cultivated fields. The savages, even the wild and warlike Comanches, were easily conciliated, and the whole land was dotted—at vast distances one from the other, it is true—with smiling homesteads. That happy and noble results would have ensued, none can doubt, had not the trump of war shaken the fabric of society, and replaced the back settlements in the condition of a wild and unproductive waste.

Andrew Pollock, a Kentuckian landowner of no inconsiderable wealth, had been one of the earliest colonists who determined, at the instance of Moses Austin, the original settler, to make Texas his home. Of peculiar tastes, however, which led him to love the solitude and sublimity of the woods and the mighty prairies, where none but the painted Indian is found to dwell, Pollock, with his family, passed the outermost borders of civilisation, and erected his tent some thirty miles beyond San Antonio de Bexar, within the district where the Arabs of the American desert, the Comanches,* hunted and fought. His habitation presented,

* Of this remarkable tribe of Indians—their manners, customs, and peculiarities—an account will be found in 'The Enchanted Rock,' a little volume by the author of the above narrative. London: Hayward and Adam.

after two years of care had been devoted to it, a most pleasing sight. Andrew Pollock had selected as his abiding place the mouth of a valley, where a stream burst from its pent-up position between craggy heights. To the north and east spread a vast plain, dotted with its lands of timber, while a thick grove in the vicinity of the dwelling showed that the wary Kentuckian was as much alive to the importance of his proximity to wood as to water. The dwelling and its appurtenances had been erected with care and taste; its size betokening that room had been provided for a large family, while a stockade proved that danger was yet to be feared in that secluded spot. Numerous fields of corn, maize, and other vegetable productions, were carefully fenced in, while large herds of cattle roamed at will over the plain, recalled at even by the sound of the guardian's voice and bell.

Early on the first Sabbath morn in May 1835, the whole family and the labourers were congregated on a kind of lawn in front of the dwelling at breakfast. The family was composed of the father, mother, two sons, and a daughter, Helen Pollock, a charming girl, who added to the unsophisticatedness of the wilds the advantages of an excellent education. A dozen farm-labourers and their wives, with half as many black slaves, completed the party, if we add a solitary Indian, who stood leaning against an upright post a little way from the table. Fray Cristobal was an anomaly in his tribe. About two-and-twenty, gay, tall, and handsome, with features utterly distinct from his companions, though paint and exposure had done their worst, this young man commanded a band of daring warriors, who carried their arms into the very heart of Mexico. His followers, about sixty in number, it was notorious, were better accoutred and better provided in every way than their fellows, while, different from the usual Indian practice, they yielded implicit obedience to their chief. Between Pollock and Fray Cristobal, as he called himself, a friendship had subsisted ever since the farmer's settlement, which was invaluable to the white man, who, in the constant presence of his Comanche friend at his farm, found his best protection against injury.

'I tell you, Fray Cristobal,' said Andrew Pollock, 'on the present occasion you must be mistaken. A Mexican army in full march on Texas, and a regiment of dragoons about to pass this way—impossible!'

'Fray Cristobal has seen them. War has begun, the Mexicans have thousands in the field, and my friend will feel the first blow if he is not wise,' replied the other calmly but firmly, in pure English, or rather American, as our tongue is called in these regions.

'You appear very positive,' said the colonist, 'and I must fain credit your words. But what would you have me do? If the Mexicans are in such force as this, surely to defend this house would be of little use, unless indeed your warriors could be brought down?'

'My warriors are far on the war-path, and Fray Cristobal is alone. His arm would be as a reed to defend; but he will hide the gray-head and his flock,' exclaimed he, his eye glancing with a look of mingled bitterness and admiration at Helen.

'Fly, and leave my home to the destroyer?'

'Or stay and be destroyed with your home,' said the Comanche chief.

'Father,' interposed Helen, rising and moving nearer to him, 'better let home and the wealth of this world perish alone, than us die with it. If there is danger, follow Cristobal's advice, and fly.'

'It is too late,' said the Indian in a tone of deep dejection; 'look up the valley; the sombreros of the Mexicans are rising on the edge of the cliff.'

It was too true: the peace of that quiet spot was to be invaded, and by the ruthless and pitiless Mexicans, with orders to treat all Americans as rebels, and put them to death on the spot. Before the strength of Texas was discovered, such was the terrible policy of the late President Santa Anna. A loud shout from the Mexican cavalry proclaimed their delight at their arrival at a habitation; and in a few moments the house was surrounded, and all its inhabitants made prisoners, with the exception of Fray Cristobal, who had instantly sought the cover of the wood. The wild appearance of the centralist troops was little calculated to reassure the captives. With huge low-crowned hats, gaudy jackets adorned with buttons, pantaloons covered with tinsel, and the *serape saltillero*, or fancy blanket, they at the first glance looked picturesque enough; but black and unwashed faces, eyes in which gleamed no fire of mind or intellect, the knowledge of their gross ignorance, with their huge mustaches, blunderbusses, and every variety of firearms, filled the thoughts with visions of banditti, to whom, in guise and conduct, the Mexican soldiers unfortunately approximate too much.

Andrew Pollock, with his whole family and dependents, were now led before the commanding officer, a young man in a faded uniform, with the addition of a yellow cloak and a high steeple-crowned hat. This was Colonel Don Jose de Sarmiento, who, eyeing his prisoners with little favour—except indeed the fair-haired and now pallid Helen—inquired who they were, and what they did within the confines of the Mexican territory? Andrew Pollock, who understood Spanish, replied somewhat haughtily that he was a free-born American citizen, and, by adoption, a member of the new republic of Texas. Colonel Don Jose scarcely permitted him to finish his reply, ere he cried, 'A rebel! a rebel! *Muertos a todos los Tejanos!** I shall rest here a day or so: to-morrow morning, at daybreak, let these rebels'—comprehending by a sweep of his arm all the white men—'die. You, Pietro, back to General Woll, and bring his warrant for their execution.' Andrew Pollock and his sons, with all the white men, were now hurried into one of their outhouses, round which a strong guard was placed, while Helen and the rest of the women were placed in safe custody within one of the huts of the labourers, also guarded.

Colonel Jose, after giving the inexplicable order, as it appeared to his men, to spare all property as much as possible, and to touch nothing but what was absolutely necessary for their refreshment, sat down on the lawn with his officers to eat the untasted breakfast, which had been provided for its rightful owners. For some time the colonel was silent, apparently musing deeply within himself. At length he spoke in a low tone to the next in command. It appeared that, struck by the comfort, peace, and tranquillity of that retired hamlet, the soldier, called much against his will from the pleasures of Mexico city, had conceived a desire, very natural in a conqueror, of appropriating Pollock's property to his own use; and as of course, in his view of things, Mexico must triumph, of settling there and making it his home. 'It will make a lovely ranchero,' said he, gazing with admiration at all the evidences of Anglo-Saxon taste and industry displayed around; 'and with that little fair beauty for its mistress, it would be a perfect paradise.' Colonel Jose was notoriously a man of impulse; but as the present whim promised to transform a lieutenant-colonel into a colonel, the inferior officer made no comment, but with a meaning smile said, 'You can learn your fate at once: make her hand the price of her father's life, and I doubt not Padre Vevortlia will wed you on the spot. The old fellow will doubtless be too happy to give his daughter's hand and his possessions to save his rebel life.' Colonel Jose, approving of his subordinate's idea, Helen and her father were sent for. The interview took place in the best room of the house, where the invader unceremoniously installed himself in the arm-chair that up to that day only the patriarch of the spot ever sat in. The colonel's air was self-satisfied and confident. He knew the lax

* Death to all Texans!—a cry which hurried hundreds of Texans to a bloody end. Four hundred were slaughtered in cold blood at one time in the war.

principles in vogue in Mexico, and that few would there hesitate between life and honour. He therefore boldly broached his proposition of giving Pollock and all his dependents liberty in exchange for his possessions and his daughter. Pollock was petrified; while Helen, who understood Spanish, looked at her captor in disgust. 'No, infamous spoliator!' said the stern Kentuckian; 'my life is in your hands—take it; but neither lands nor child shall be yours. My daughter wed a Mexican robber! No. My life you will take; but yet a few days, and my brave countrymen will scourge you and your race back beyond the Great River.' The colonel was astounded, and at once ordered his prisoners back to confinement. Sentiments of this character were so new to him, that it required some leisure ere he fully comprehended their force. He then reiterated his commands for the execution, stroked his mustache with a self-satisfied air, and lay down to an early siesta.

Helen, meanwhile, who sat at her prison window gazing out upon the scene before her with vacant eye, dwelt with agony upon the position of her family. Her thoughts were of a mixed character. Horror at the proposition of the Mexican partisan was mingled with the reflection that her sacrifice might save many whom she loved. This again was doubtful, as the free gift of the property appeared the great object aimed at by Don Jose. Then came upon her other thoughts of one who had laid his life and love at her feet, and whom she had rejected with disdain because of his colour—Fray Cristobal. He had offered to quit his tribe, his roving life, all for her, and settle down a colonist under the banner of Texas. Her manner, her shrinking repugnance at binding herself to one with Indian blood in his veins, had been sufficient answer for the warrior. He had spoken no more, but his altered mien indicated deeply-wounded feelings. Helen knew him well, and knew that, under other circumstances, Fray Cristobal had perilled life, all, for her and her family. She felt with bitter regret that on his devotion she now had no claim.

The day passed; the Mexican soldiers ate, drank, slept, and amused themselves, a few keeping watch. Night came, and then sentinels were posted at every weak point: in fact a chain of soldiers surrounded the house. Ingress and egress appeared equally impossible. Hours passed; the last meal was brought to the prisoners, with an intimation that at daybreak the terrible tragedy would be enacted. For greater safety, lights were denied them, though the guards omitted to deprive the captives of their pipes and tobacco pouches, in which flint and steel were always kept. For about two hours after sunset, no sound was heard save the measured tramp of the mounted sentinels without the stockade, and of the foot within. Helen sat alone at the window of her hut, which overlooked the lawn. To the right was the outhouse containing the male prisoners, to the left the stream. On this now fell the rays of the dim moon, just rising from a bank of clouds; and on this Helen gazed, under the influence of the only feeling which preserved her from utter despair. It wanted an hour of midnight, and yet there was no sign given. Ten minutes more passed, when a dark mass rising slowly from the water gave hope, and made poor Helen's heart beat wildly. A figure was clearly visible. It stood upon the brink of the stream, near a wood-pile, when a musket-shot was fired by an observing sentinel. A heavy plunge was heard in the water, and when the alarmed sentinels reached the spot, a dark mass was seen floating down the river, already at a distance. Satisfied that the Indian intruder had been slain, or mortally wounded, the soldiers, after reporting as much, returned to their posts.

Helen, who had seen the Indian, after throwing a log into the river, glide behind the wood-pile, now saw him, with intense anxiety, crawl along the line of buildings. He reached the spot where she stood, and was about to pass, when a low-whispered 'Cristobal' arrested him. 'Miss Pollock,' said he in the same tone, 'in one sentence tell me all you know.' Helen in a few hurried words explained all. 'Your father, all, shall be saved.' 'Oh, Cristobal, do that: save my father, my mother, my brothers all, and my deep and eternal gratitude shall be yours.' 'Gratitude is but a cold word to me,' said Cristobal, who with her dropped all semblance of Indian manner. 'Be generous, dear Cristobal,' whispered Helen, blushing unseen in the darkness. 'I have been cruel, unkind, but your devotion to my friends will make me forget all.' 'Even my Indian blood?' said Cristobal, with a sad melancholy in his tone which went to the girl's heart. 'All but your noble risk of life and all life's joys to save my friends.' 'And you, Miss Pollock?' 'Cristobal,' said the agitated girl hurriedly; 'dear Cristobal, such dreadful scenes as these make us live years in an hour. Call me, then, Helen; save my father and mother, and hope everything.' Fray seized the girl's hand through the barred window, and said in a husky tone, 'If I save all, would you forget my Indian taint, and become my wife?' 'I would—I will,' said Helen, who in this hour of peril became a woman, forgetting all maiden coyness in the excitement of the moment. 'From gratitude only?' said Cristobal gloomily. 'I will never marry a man I do not love and respect.' 'And you will be mine?' 'I will.' 'You love me then?' 'Dear Cristobal, waste not the precious moments; think what is most dear to you, and doubt not but time will prove you not far wrong.' There was a tenderness in Helen's tone which carried irresistible conviction, and pressing her hand to his lips, the young man glided away towards the shed in which the men were confined.

A brief and hurried conversation now ensued, which having lasted about ten minutes, the Comanche chief returned, and bidding Helen be of good cheer, again sought the river, and plunging therein, disappeared. The agitated girl now noticed that a great bustle was taking place in the shed containing the male prisoners, as if the whole party were busily engaged in moving all it contained. Sounds of breaking up barrels were plainly heard, and then the low and cautious striking of a light. Helen's heart beat violently; she felt confident that some plan arranged between Cristobal and her father was about to be carried out. Next instant a flame rose in the shed on the side which communicated to the outbuildings and granaries, while handfuls of burning sticks were cast from narrow loopholes, which were intended to supply light and air to the erection. The alarm was given; the sentinels rushed to stay the flames and punish the audacious captives, when the door flew open, and a volley of musketry was poured upon the astonished Mexicans. The prisoners had been placed in the arsenal of the whole hamlet. And now, amid the roar of musketry and the crackling of the flames, came the fearful Comanche war-whoop from the plains upon the bewildered and affrighted Mexicans. To defend the house was impossible, as the fire would soon wrap it in one mass of flames; but for this a successful resistance might have been made. As it was, without attempting to recapture the armed Anglo-Saxons, who poured a galling fire upon them, the Mexican cavalry mounted, and collecting in one dense body, retreated towards the valley, followed by the Comanche horse, of whom they entertained a most wholesome and salutary fear.

Efforts were now made to extinguish the flames, which had been the main instrument in dislodging the Mexicans, who, but for this, would have held good the house against the Comanches. It was, however, in vain, and all that could be done was to remove the wagons and every kind of valuable from their proximity to the conflagration. This the party soon effected, the furniture in the house being all saved and placed upon the green sward. At dawn of day nothing remained of the late comfortable and happy home of the stern Kentuckian but smouldering rubbish and blackened stumps. Still, more than he hoped for had been saved in the

shape of household goods and cattle, while not one precious life had been lost.

No time was, however, to be lost, as the whole Mexican force could easily overtake them. The wagons were loaded with rapidity, the oxen harnessed, and the cattle all driven into herds. In an hour every preparation was made, the word was given, and, escorted by the Comanches, Andrew Pollock turned his back upon his late home, to seek one less subject to the inroads of an invading army. Like most of his neighbours, the patriarch of the wilderness had resolved to send his wife and daughter, with the other women, to the sea-coast, and, joining General Samuel Houston, do battle for his country. For several days the Comanches accompanied the cavalcade, and then, according to Indian custom, disappeared without the ceremony of an adieu. The leader, however, remained, who then, in the presence of her whole family, declared the engagement between himself and Helen. Andrew Pollock started in anger, and turning to his daughter, said, with little delicacy towards his Comanche preserver, 'Helen marry an Indian!' 'Who saved my father from death and me from worse?' replied Helen firmly. 'Not an Indian,' exclaimed Cristobal, at this instant extending a parchment to Andrew; 'but Henry Norton of Kentucky, captain in the service of the republic of Texas.' The young man then explained that his father, impelled by romantic feelings, had wedded a beautiful Indian girl; that on coming into the enjoyment of that parent's property, galled by the concealed sneers of some of his acquaintance, and the feeling that Indian blood was in his veins, he had adopted his mother's baptismal name, and fled to her relatives, where, by dint of gallantry, and by spending his income among them, he had raised the troop we have above alluded to. Until he saw Helen, he had determined for ever to dwell with the Comanches: her beauty had, however, won him back to civilisation. We need enter into no further particulars. The lovers were united; Henry, Andrew, and the sons, all distinguished themselves in the war of independence: it ended; and now peace being finally established, the family once more occupy their original abiding-place, where the writer in 1842 enjoyed their unaffected hospitality.

A WORD ON THE ENGLISH AND SCOTCH CRIMINAL LAW.

During the last few years, a commission has been investigating the state of the criminal law of England, with a view to its amendment; and already eight reports—blue-books of portly size—have made their appearance. That the English criminal law stands in need of great reform, is universally acknowledged, and every one must be glad to learn that at length something is likely, from the recommendation of these reports, to be done. From what we have seen, however, of the reports, it is to be feared that this 'something' will be altogether homœopathic in its practical application. A number of the worst features of the system will in all probability remain.

One thing strikes us as remarkable in perusing these reports—the apparent ignorance among the commission of there being such a country as Scotland, or such a thing as Scottish criminal law. We scarcely think this species of ignorance commendable. In looking about for better institutes and usages, it is surely worth while inquiring if anything of the kind can be had from a country so very near home; more especially since the criminal code of that country does not seem to stand in need of either commissions or blue-books, but goes on in a way quite satisfactory to its people. We propose, in our humble way, to remedy this oversight.

The Scottish criminal law is only to a small extent founded on special statute. The origin of much of it is unknown, or is at least very remote; and, in general tone and tendency, it may be described as temperate and humane. Embodied in a few law-books, which are considered as authorities, it is simple and intelligible to every comprehension. The forms of its administration, however, are more remarkable than its doctrines; and it is to these we crave the attention of our English readers.

In the first place, all crimes whatsoever, from simple larceny to the most heinous offences, fall within the cognisance of a public prosecutor. To every court of justice in the kingdom a public prosecutor is attached. All civic jurisdictions, police-courts, county or sheriff-courts, as well as the higher criminal tribunals, have their respective prosecutors. The prosecutors thus attached to the inferior courts are styled *procurators-fiscal;* those connected with the higher jurisdictions are the lord-advocate and his deputes. These functionaries respectively receive complaints from parties injured, sift out the facts of the case, and sue the criminals before the court to which they belong, *altogether at the public expense.* The injured party in no case has anything to do with the duty of prosecuting; he is summoned only as a witness, and gives himself no uneasiness as to the result. When he has given his evidence, he has no more to say or do. Neither the prosecutor nor other officers of court call on him for a single farthing of expense. All this is quite different in England, where the private or injured party is bound to prosecute, and has generally to pay a large sum in expenses. We have heard it stated, though we speak only from hearsay, that the sueing of a criminal before one of the higher courts in England seldom costs the unhappy prosecutor less than twenty pounds. At all events, the expense, whatever it is, acts as a preventive to complaint. It would appear that the wisest thing any man can do who is robbed, is never to say a word about it. The expectation, under such a system, of anything like a correct return of the crimes annually committed is out of the question.*

We have mentioned one point in which the Scottish procedure may be considered superior to the English; the next is, the means of determining whether there be sufficient grounds for bringing the accused to trial. This determination in Scotland rests with the lord-advocate, or with the procurators-fiscal in the case of inferior offences. The lord-advocate is a responsible crown officer; and it is matter of observation that he prosecutes neither wantonly nor negligently: the cases laid before him and his deputes undergo a deliberate scrutiny. By this arrangement, which we never heard impugned, the public generally are put to no kind of trouble. To prevent oppression, and afford an opportunity of preparing a defence, the indictment must be served on the accused fifteen days at least before trial, along with a list of the witnesses to be brought against him, also the names of all the jurors who are to appear on the assize. Poor prisoners are assigned agents and counsel to conduct their case through the court. Compare this simple and humane, yet efficient machinery, with the clumsy English apparatus of a grand jury—sending men to trial by the score with scarcely a minute's warning. At the central criminal court in London, the grand jury sometimes passes three or four hundred cases through its

* Since the above was in type, Sir Robert Peel has proposed in parliament to pay the expenses of prosecution from the public funds; but this, we believe, only applies to that portion of the expenses usually borne by the county rates—not to the part payable by the private prosecutor.

hands within a week, the investigation of a case in many instances not occupying a quarter of an hour.

Following the accused into court, we again see how much more reasonable is the routine of procedure against him in the Scottish criminal law. There is a deliberate distinctness in every step in the process. The witnesses are sworn by one of the judges in a solemn and impressive manner, by the holding up of the right hand, and calling on the Almighty to attest the truth of what is about to be uttered. The attitude of the judge, rising from his chair with outstretched arm to perform this duty, is considered so striking, as to have been adopted by the sculptor: one of the finest statues in Scotland is that of President Forbes in the act of administering an oath. In England, as is well known, oaths are administered by an inferior officer of court causing the witness to kiss the outside of a book, and this he does in a manner so hurried and profane, as to be little better than a burlesque. With respect to the examination which follows, we would add, that in no Scottish court of justice would barristers be suffered for one moment to bully and ridicule witnesses, as they seem to do with impunity in England. In the execution of their onerous duties, the Scottish judges uniformly act the part of protectors alike to witnesses and the unfortunate prisoners at their bar; the decorum which uniformly prevails, the pains taken to arrive at the truth, and the appearance of even-handed justice, in trials before the Supreme Criminal Court at Edinburgh, or any of the circuits, seldom fail to excite the admiration of strangers. Within the last few years in England, prisoners have been permitted to plead by counsel. In Scotland, this has been the humane practice for centuries.

In the enclosing of a jury, the superior advantages of our northern practice is remarkably conspicuous. Out of a certain number of persons summoned, *fifteen* are selected by lot, and their decision, by a *majority*, if they cannot all agree, at once settles the innocence or guilt of the prisoner. Compare this latter arrangement with the English plan, of compelling twelve men to be unanimous one way or another! The spectacle of starved juries is never seen in Scotland; and one can only wonder how such a barbarism should till this day be tolerated in the sister kingdoms. A few days ago, as we observe by the newspapers, a jury on a criminal trial was nearly starved to death at Mullingar, in Ireland. The report is worth extracting.

'This morning, at ten o'clock, the Chief Justice of the Common Pleas and the Chief Baron took their seats on the bench, when the jury were called into court.

Chief Baron.—Well, gentlemen, have you agreed to your verdict?

Foreman.—No, my lord, we have not.

Chief Baron.—Is there any likelihood of your agreeing?

Foreman.—Not the least, my lord.

Chief Baron.—Under these circumstances, gentlemen, you must again retire to your room, as there is no alternative. We have no discretion in the matter.

Foreman.—My lord, there is not the least use in our retiring again, as there is no possibility of our ever agreeing. There are ten of us one way, and two the other; so, my lord, you may as well be good enough to discharge us, for agree we never will on this case. We are now twenty-four hours locked up in our room, with only some water for refreshment, and a very indifferent fire, and some of us in very poor health indeed. Our room is more like a dungeon than anything else; and if we are confined any longer, it may seriously endanger our lives.

After a short discussion, the jury were sent back to their dungeon, protesting that they should be starved. They accordingly remained in confinement all night and next day, and were only relieved at the end of forty hours, at which time they remained of the same way of thinking as at first. A new trial was ordered.'

The editor of the newspaper (*Daily News*, January 24) whence we copy these particulars, concludes with the following just remarks:—'Suppose these maltreated gentlemen had been at length, as a question of self-preservation, starved into a verbal agreement, and pronounced a decision. What is it worth? Can justice receive it?—can common-sense receive it?—can public opinion receive it? No; but law can. Truly a pretty condition of the law in the nineteenth century! * * * If by these proceedings of a barbarous age—by which I mean the present age, as in this instance palpably united with the ages of torture and other barbarities in the insulted name of justice—if by these proceedings any one of these gentlemen forming the jury at Mullingar should lose his life, either in a few days, or weeks, or months, as the previous circumstance of his years, constitution, and health or sickness at the time may determine, then the law is directly chargeable with wilful and deliberate murder.'

What a state of affairs is this! In trying one man, murdering a dozen. The remedy—and the only one we can see—is to introduce the Scotch practice of a jury of fifteen, whose decision, by a majority, shall be deemed sufficient.

The last point on which we have a wish to speak, is the indecent haste with which the ordinary class of cases are tried in England. The whole affair at the Old Bailey seems to be conducted with the speed of a whirlwind. Before a poor wretch can look about him, he finds himself condemned to transportation or the gallows. More time is usually occupied in a Scottish small-debt court to determine a claim of five shillings, than is in many instances employed in deciding on the fate of a fellow-creature at this English tribunal. This excessive precipitancy, arising, no doubt, from the undue accumulation of cases, and the incapacity of the court to overtake them, does not, as far as we can perceive, call forth the reprobation of the commissioners, who only refer to the frequent *necessity for a new trial*; and this they consider a desideratum in a variety of cases. We altogether object to this clumsy mode of remedying an acknowledged abuse. Instead of granting power to institute new trials, on the ground of correcting previous errors, would it not be much more reasonable to take time to investigate the case at first?—devote a day, or even half a day to the trial, instead of slapping it off in fifteen or twenty minutes?

In the blue-books before us, there is some remarkable evidence bearing on this cruel perversion of justice. It seems to be not an unusual thing in the metropolis to condemn men for crimes of which they are altogether innocent. Sometimes these unfortunates are hanged; and in other instances, by a little fortunate inquiry, they are saved. Will it be credited, that in the year 1828, no fewer than six persons were saved from death in the course of only nine months, in London alone, by the humane exertions of two individuals, who made it appear, beyond dispute, that in five cases of the six the prisoners were totally innocent, while in the remaining case the prisoner, although seemingly guilty, had been convicted in a grossly illegal manner? The first of these cases mentioned in evidence was that of two men, Anderson and Morris, who were condemned to death for a robbery, and ordered for execution. By a little inquiry, while these poor men were under sentence, Mr Wilde, an attorney in extensive practice in London, discovered that they were really innocent. With the greatest difficulty he procured a reprieve, but not till half-past eleven o'clock on the night before the execution was to take place. Perhaps even then it might not have been procured, but for the assistance of the governor of the prison and his deputy, who were led to take the same view of the case as Mr Wilde.

Mr Wilde detailed a second case. A man named Smith was found guilty of forgery, and sentenced to death. He had pled guilty on the assurance that if he did so his life would be spared; but there was no appearance of this promise being fulfilled, although the connexions of the party condemned used every exer-

tion to save him. About four or five days before that fixed for the execution, Mr Wilde, who had heard the condemned sermon preached, was applied to by the prisoner's brother-in-law, a respectable tradesman in Cornhill, who had been going about for several days trying to obtain a hearing in behalf of his unfortunate relative. From him Mr Wilde learned the particulars of the case. The prosecution, it appeared, was instituted by the Committee of Bankers; and as many prisoners had been acquitted in like cases from the difficulty of proving the utterance, the solicitor for the Committee of Bankers thought fit to authorise Mr Cope, the city marshal, to go to the prisoner and promise that, if he pled guilty, his life would be spared; in other words, his sentence would be commuted into transportation for life. Mr Wilde communicated these facts to Sir Robert Peel, who again communicated them to the Lord Chancellor, Lyndhurst. Lord Lyndhurst then summoned to his private room the prosecutor, the solicitor for the Committee of Bankers, and the city marshal; and the facts appearing exactly as the prisoner's brother-in-law had stated them, Smith was respited during his majesty's pleasure. In this case, although the prisoner may not have been innocent of the crime, yet it is evident that, having been led to plead guilty by a false representation, he had had a most unfair trial.

The third case alluded to by Mr Wilde was one in which two poor destitute Irishmen, named Mallet and Farthing, had been convicted, on circumstantial evidence, of a capital offence, and sentenced to death. The result of Mr Wilde's investigations having been to satisfy himself that the men were totally innocent, and that the charge was a conspiracy on the part of the prosecutors, he was able to procure their respite. In addition to these three cases, in which he was concerned in the way of personal interference, Mr Wilde mentioned a fourth, in which a man named Brown, who had been indicted and found guilty for robbing a woman, got respited through the exertions of his master, Mr Lingham, who was convinced of his innocence.

Thus, in the course of nine months, were six persons saved from death after conviction; five of whom were innocent of the crime for which they were to die, and one of whom was unfairly treated on his trial. Mr Wilde also stated his opinion, that 'if the documents at the Home Office were examined, many cases would be found in which, by the exertions of former sheriffs, the lives of persons ordered for execution had been saved.' The horrible inference is, that there may, in all probability, have been cases in which, either from the want of such active and humane interference as that of Mr Wilde, or from the strength of appearances against the condemned parties, innocent persons may have been sent out of the world by an ignominious death.

Tradition may have preserved one or two cases of individuals in Scotland being executed wrongfully; but in modern times nothing of the kind, we believe, has been heard of. For this we are not more indebted to the cautious inquiry of the lord-advocate and his assistants, than to the system of preliminary examinations by the procurators-fiscal and sheriff-substitutes. These sheriff-substitutes are a class of stipendiary magistrates, one of whom is resident in each county; but some counties have two or three: they are all men educated to the law, and form a valuable body of officers, having cognisance of civil as well as criminal matters. In England, there is no order of functionaries exactly parallel to these resident county magistrates, which we cannot help considering a misfortune. It is universally allowed, that to no institution has Scotland been so much indebted for its permanent order and tranquillity, as to that of its sheriff-substitutes. The introduction of such impartial functionaries into Ireland might be considered invaluable.

Such are a few points which we have thought worthy of making known to our English neighbours. We are far from saying that the system of Scottish criminal procedure is perfect in all its details. At a subsequent opportunity we may show defects which it is desirable to remedy. Meanwhile, with all its imperfections, it works smoothly, and to the satisfaction of the country. Taken as a whole, it seems immeasurably in advance of that of England; and we respectfully submit it to the consideration of 'her majesty's right trusty and well-beloved commissioners, touching crimes, and the trial and punishment thereof.'

VISIT TO THE CRICHTON INSTITUTION.

On one of those lovely mornings with which a brilliant but reddened sun occasionally favours us at the beginning of December, I wandered from the town of Dumfries into the midst of the beautiful valley in which it is situated, and through which the 'winding Nith' pours its waters. Pursuing my way about a mile along the banks of this stream—through scenery rendered classic by the genius of Burns—I found the landscape adorned with a stately edifice, occupying a gentle eminence which slopes gradually towards the river, and presenting a grand and imposing appearance. From a massive but low tower or lantern in the centre, radiate four wings, of commanding proportions, which are surmounted by a balustrade ornamented with numerous vases. The building is pierced by many windows; the whole presenting those architectural features which are always associated with the Elizabethan style. This magnificent structure is the Crichton Institution, an asylum for lunatics; and as its origin is peculiar, I propose to give some account of it.

It appears that the late Mr Crichton made an immense fortune in India. Without arbitrarily bequeathing a sum of money to found an hospital, he expressed in his will a wish that his executors would apply a portion of his wealth to some great benevolent purpose. His widow and chief executrix—the highly-respected Mrs Crichton of Friars' Carse—decided at first, in compliance with her husband's implied desire, to found a college. For this purpose she applied to the then lord chancellor, whose sanction, in the first instance, it was necessary to obtain. That functionary, however, expressed an opinion that the educational wants of Scotland were already sufficiently well provided for—a high and well-merited compliment to the country; but one to which the benevolent lady was so little inclined to accede, that she still pressed her petition to be allowed to build a college. The lord chancellor was obliged at last positively to refuse the lady the requisite powers for carrying her cherished design into execution. Soon after this disappointment, she happened to be visiting Bath, and was induced to inspect, for curiosity's sake, the admirably-conducted lunatic asylum which is situated near that city. She immediately remembered that there was little accommodation for lunatics, particularly for those of the higher classes, in Scotland; and eventually decided on realising her husband's wishes, by erecting an institution for the insane. The project was accomplished with skill and magnificence—or rather partly accomplished—for only half of the architect's design has as yet been completed. When finished—which I was told it will soon be—this edifice will be one of the most splendid in Scotland.

As I applied for admission at the porter's lodge, by showing my letter of invitation from the principal, a handsomely-appointed carriage, shaped like an omnibus, was passing out. One of the occupants, a lady, greeted me with a smile of welcome, so frank and engaging, that I mistook her for a lady in authority. She, as well as her companions, however, were patients about to take

their morning drive. The grounds are so extensive, that, when entered, some distance had to be passed over before the institution itself could be reached. Fifty-six acres are laid out in gardens, walks, pleasure-grounds, orchards, and shrubberies, for the use of the patients; many of whom I met, engaged either in gardening, as at Morningside,* or promenading. Passing under a lofty archway, I found myself in a quadrangle, and was admitted into the interior of the building—which proved, on close inspection, to be constructed, not of brick, as might at first sight be supposed, but of the new red sandstone with which this district abounds.

Once entered, the excellent plan of the building is easily understood. The massive tower seen outside, standing in the midst, gives off four wings, which contain galleries one above another three storeys high. The corners formed by the departure or stretching out of the wings from the tower, are filled up with either dining or private sitting-rooms, whilst the sleeping apartments are ranged along and entered from the sides of each gallery. A view of what may be going on in each of these galleries is obtained from the central tower, which consists inside of a staircase, with landings so placed as to allow a spectator to see through the glazed walls into each of the four galleries of the storey he may wish to command. The ground-floor is appropriated to paupers, the officers of the institution, &c.; the floor above accommodates most of the higher-class patients who can afford separate attendants and apartments. The highest storey is set apart for patients of the middle classes. The rates of payment for board and every accommodation vary from L.15 per annum (for paupers) to L.350 for such as are provided with all the conveniences, and some of the luxuries, of high life. Ascending the stairs of the tower to their very top, level with the roofs of the wings, we reach a circular gallery, arranged as a library, which, as most of the inmates belong to the educated classes, is very much used. In the last report of Dr Browne, the medical director, it is stated that it already consists of 650 volumes. Over and above these, private collections, belonging to patients, are distributed throughout the institution. Books constitute, it would seem, a valuable and never-failing engine in moral treatment; and different kinds of books are prescribed for the mind as systematically as different sorts of medicine are ordered for the body. By them passion is often subdued, and a healthy tone of feeling revived more effectually than by direct repression or inculcation. To those who have been highly educated, who have belonged to one or other of the learned professions, who have made literature a pursuit, or who have depended for much of their happiness upon reading, a library has become not a luxury, but a necessary of their moral existence. One bibliomaniac in the asylum has already exhausted the store, and sighs for additions. In proof of the benefit of books, it is stated that a gallery of patients, in which the number of readers is large, is comparatively a quiet, happy, and healthy department of the establishment. Neither are the habitual readers mere triflers over newspapers and periodicals. At one period the following books were in the possession of patients:—Thierry's History of the Norman Conquest, D'Aubigne's History of the Reformation, Gil Blas, Shakspeare, and many of Sir Walter Scott's novels, &c.—a catalogue which shows the varied and elevated tastes which must be supplied, and the identity of the pursuits of many of the insane with those of men of strong intellect and fervid genius. To one of these students a daily task was allotted, and he subjected himself to examination by the medical attendant, in the same way that a course of history should be conducted. Another busied himself in compiling a commonplace book; a third translated a treatise upon Dipsomania, ostensibly to facilitate the labours of the superintendent; a fourth scanned the newspapers, and extracted all facts bearing upon a topic of interest; while a fifth actually furnished to a periodical the creations of his fancy. One amiable, accomplished, and excellent being, who imagined that it was incumbent upon him to abstain from food, to increase the comforts of the poor, and to prevent a general famine, and that his brain was transmuted into fat, and consequently impeded the exercise of his faculties, was induced to engage in the study and translation of Molière's amusing comedy, the *Malade Imaginaire*. He spent many delightful hours at this task, bending his powers diligently to overcome the difficulties, and to discover the beauties of the author; coming out of himself, as it seemed; forgetting his own sorrows and ailments; and, it may be, tempted to doubt their reality, while laughing at the hypochondriacal fancies and medicine mania of the principal character, Argan.

Those patients who have not ability or inclination to read, are occasionally read to. On one occasion it was determined to produce a powerful, painful, and retrospective train of feeling in a person who seemed to be lapsing from a state of high over-wrought sensibility into one of apathy and senility. He had distinguished himself as a poet, and during one of his darkest and dullest moods, some of his own beautiful and pathetic verses were read to him. He at first smiled, then appeared to be awakened to a recollection of the circumstances and emotions under which they had been composed, then became deeply affected, and wept. He was agitated for some hours, but the effects gradually disappeared. Directly or indirectly, therefore, the library is employed as a means of alleviation and cure. Still, some caution is requisite in its use, and a check is imposed upon the course of reading; as when an inmate afflicted with a suicidal mania inquires for Bolingbroke's works, or Anne Radcliffe's novels. Delusions have indeed been created or confirmed from certain passages in books. One patient having found in a periodical a description of the character of George III., drew a parallel between himself and that monarch, and then proclaimed himself George V. But such accidents are counterbalanced by the amount of real knowledge, the habits of steady attention and consecutive reflection, the exercise of memory, the introduction of happy and wholesome views of mankind, the springs of innocent mirth, which even enfeebled or erratic faculties receive from reading, be it ever so desultory.

Descending into one of the galleries of the upper floor, I passed several ladies amusing themselves in various ways, and entered the chapel. This is modestly rather than handsomely fitted up, and quite in accordance with the solemn uses to which it is put. As regards the behaviour of the unhappy congregation, their physician speaks in a candid, but, on the whole, favourable strain. 'Although,' he remarks, 'it would be too sanguine a view of the experiment and of its effects to affirm that the same degree of decorum and quiet exist as in a sane congregation, yet the composure and sobriety of the most restless and rebellious patients is a proof that this influence is considerable: the self-control exerted is greater than under any other circumstances; and the expressions of gratification derived from the service prove that it is appreciated. The calm which prevails is of course partly the result of the selection of the audience, but proceeds in great measure from a recognition of the purpose of the meeting, from the early associations which still influence the habits, although not the reason, of the insane, from the principle of imitation, and the restraint imposed by the presence of others, and by good manners or respect for authority. Of those who generally attend chapel, however, many are actuated by higher motives and more rational views; many have contracted an attachment to the excellent chaplain, whose kind disposition, gentle

* See vol. iv. p. 409, new series.

manners, and simple Scriptural teaching, they have learned to value and to love.' An inscription is placed opposite the pulpit—plain and expressive—dedicating the whole building to the late Mr Crichton, by his widow—a noble and praiseworthy monument, whether considered externally or morally.

Leaving the chapel, I was introduced to a gallery containing about a dozen gentlemen. On being shown into the sitting-room common to them all, various implements of amusement and pastime were observable. Drawing and painting appear to be resources occasionally resorted to. One gentleman acquired so great a dexterity in the use of crayons, as to produce portraits of exquisite finish; one of which I saw. His was an exalted mania, and he seldom condescended to portray the countenance of any one who was not a hero or a person of rank. Except one unfortunate man, who stuck himself rigidly and immoveably against the wall, and kept his eyes intently fixed on vacancy, none of the inmates of the upper galleries showed signs of discomfort or eccentricity. They were perhaps a little less noisy, less communicative to each other, than a similar number of sane persons, placed in the same situation, would have been.

In the dining-room common to the inmates of another gallery, I was shown the peculiar knives and forks with which they eat. Both are of German silver; the former too blunt for mischief, and the latter, instead of being separated into prongs, are merely grooved, in imitation thereof, up to within about half an inch of the points, where they are separated so as to be useful. Should, therefore, a suicidal or destructive patient attempt anything dangerous with such a fork, the damage would be but trifling. Some extraordinary delusions of this nature have manifested themselves in the Crichton Institution. Instances have happened in which a dread of self-destruction has been the leading characteristic of the maniac; but a dread so great, that it has driven the victim of it to attempt the act as an escape from his terrible fear of it; as if—to borrow an idea from a forcible writer on insanity—he would rush into the arms of Death to avoid looking into his face. Others show a desire to terminate existence from a fear of being murdered. Some of the expedients resorted to by these unhappy beings are extremely ingenious. One female inmate, who, while obstinately resisting medicine, from the suspicion that it contained mercury and poison—having some knowledge of the constitutional effects of that drug, and the extreme danger of taking cold whilst its effects were operating on the system—took every opportunity of filling her boots with water, in order that she might be attacked by inflammation and die. This systematic sapping of the foundations of health and strength was resorted to, after many attempts at strangulation had been detected and defeated. The ingenuity employed by persons afflicted with this mania is occasionally astonishing. A young woman possessed herself, whilst taking her daily walks, of stones and pieces of coal, and, rubbing them against the walls, so as to give them sharp edges and angles, swallowed them, in the hope of so far disorganising her system as to get past recovery. Another female, a lady of education, presents an extraordinary instance of this propensity ingeniously indulged. It was so strong, that she was placed in a room from which every article of furniture was removed, which in fact contained nothing more than a French bed without canopy, and a carpet. Notwithstanding these precautions, it was ascertained that she had pulled the carpet from the floor, collected the nails by which it was secured, and swallowed twenty-four of them. She was then removed to another apartment, where there was no carpet, and an attendant was appointed to remain constantly with her. The bed in which she lay was covered with cotton chintz, which was attached to the wood by nails. Stealthily, silently, and without changing her position or disturbing her companion, she succeeded in extracting a number of these, which were likewise swallowed. Since this period she has stolen and introduced into the stomach a thimble and a small padlock. But what is even more startling and instructive, is her confession that, when comparatively sane and serene, when most trusted, and most worthy of confidence, she was in the habit of swallowing stones, pins, needles, and other small objects innumerable, with the settled resolution to sap the foundation of her strength and life.

Incessant precaution is not necessary merely against such grave hallucinations, but to counteract the destructive propensities of some inmates. The most remarkable of these is what Dr Browne denominates *Pyromania*—a mania for destruction by the agency of fire. This subject deserves, in reference to judicial proceedings in the case of incendiaries, very serious consideration. In some instances the desire to set inflammable substances on fire is, according to Dr Browne, less a crime than a disease, and as such, epidemic from the force of imitation; and there are facts which bear out this theory. At precisely the same time in 1830, when great devastation was committed in England by rick-burners, bands of young women perpetrated similar deeds in France, without apparent object or design. The experiences of the Crichton Institution show that this mania sometimes exists with a perfect disregard of life, even where no suicidal inclinations are manifested. 'One of this class has been observed to handle ignited coals as if they were harmless, and, after setting fire to a sofa, sat quietly down upon the burning cloth, as if to court immolation. Another inmate, who originally manifested her derangement by attempting to destroy farm produce, still, upon all favourable occasions, consigns her dress to the fire, without regard to the value of the article, or to her own comfort, and obviously derives intense gratification from the brilliant flame which she has produced. This woman, although passionate, and so irrational as to recognise in her fellow-patients former friends and acquaintances disguised as females, is acute, cunning, and perfectly conscious of the culpable and dangerous nature of her irresistible propensities.'*

In the galleries set apart for the higher-class patients, I observed that the drawing-rooms were furnished with all the elegances of private life. A set of window-curtains was pointed out as the work of a lady inmate, whose mind was considerably relieved by the occupation they afforded. As far as is consistent with the sanatory expediences of the establishment, social life is surrounded with all the amenities and pleasures of the 'outer world.' Billiards, card parties, chess, summer ice, have occupied many a tedious hour within doors. In the evening, exhibitions of legerdemain, ventriloquism, musical and dancing parties, visits to the Dumfries theatre, concerts, and other public places, have been resorted to as rewards, encouragement, and distraction. And as the influence of discipline and supervision has been carried into effect in these assemblies, as the patients are never allowed to forget that they are observed, and under probation, and upon honour; and as due care has been bestowed in selecting those of decorous deportment and suitable dispositions, no ill, but, on the contrary, much good, has resulted.

The most extraordinary amusement, however—in which some of the better-class patients are allowed to indulge—is private theatricals. This bold step was first made in Britain, and Dr Browne deserves infinite credit for its introduction and success. In his report for 1844, he thus speaks of the experiment:—'Theatrical representation, as a mean of cure and pleasure to the insane, is not now confined to the Crichton Institution. Melodramas have been acted before the inmates of asylums in this country; and Tartufe has been produced by the patients in Saltpetrière at Paris, with the same sort of poetical justice which suggested the selection of Redgauntlet by the company in this asylum. Three pieces were brought out during last season; of these the Mock Doctor was

* Dr Browne's Fifth Annual Report.

the favourite. It contains some ludicrous allusions to asylums and their governors; and the shouts of laughter and triumph with which the exposure of the savage practices formerly pursued in these places was received, indicated how keenly some portion of the audience understood the point and truth of the satire, and how cordially they rejoiced at the revolution which had established the gentler rule under which they then were. Eleven patients participated in some degree or other in the representation. Four of these have since left the institution; and a fifth, who is undoubtedly indebted to the exercise of memory in acquiring his part for a resuscitation of intellect, will soon obtain liberty. But the company will survive such losses—even the desertion of the active stage-manager. In one case only, either among the actors or auditors, could excitement be attributed to the effects of the amusements. A plain prosaic, but perhaps vain artisan, was raised to the rank of lord of the bedchamber; and although all that was required in the part was to stand still and look steadily at a particular point during a mimic pageant, the assumption of dignity, the novelty of the position, or the constraint necessary, destroyed the equanimity which had been previously established, and retarded convalescence. But this event was the consequence of injudicious selection, of a sanguine estimate of the stability of reason, not of the ordeal to which the mind was subjected, and might have followed an incautious appeal to vanity, or the liberation of the patient. After an experience of two successive years, and when about to commence a third season, and after a dispassionate examination of the effect which the stage, when well directed, is capable of exerting, by the exposure and correction of follies, by the discipline, consecutive intellectual training, and the concentration imposed upon the performers, and by the gaiety and good-humour excited in the spectators, this conclusion appears to be inevitable—that no human means as yet employed has, at so little risk, and with so little trouble and expense, communicated so much rational happiness to so many of the insane at the same time, or so completely placed them in circumstances so closely allied to those of sane beings, or so calculated either to remove the burden of mental disease, or to render it more bearable. The attempt is no longer an experiment; it is a great fact in moral science, and must be accepted and acted upon.'

Of the literary amusements provided for the patients, and their proficiency in composition, mention has already been made in a notice of the publication issued by them, called the 'New Moon.'* Since then, it may be safely said, the New Moon has gained brilliancy with its age, and that the last number is as amusing and rational as the first.

On the ground-floor, devoted to the humbler class of inmates, every attention is paid to their comfort; the only difference between them and those above-stairs being in the article of furniture, which is more homely, and less abundant. Here is a 'padded room' for outrageous patients: the floor is wadded, and round the walls are placed a series of panels with canvas stretched tightly over them, which, being like drum-heads, are elastic, and prevent the patient from injuring himself. When in use, the room is made perfectly dark. Darkness is found to act as a sedative; indeed the effect is sometimes instantaneous, as if the withdrawal of light acted directly on the brain. One thing is certain, that in such a condition the sufferer has no objects whatever to excite him, as in some states the sight of the merest trifle, even of a pin, will increase the paroxysm.

This was the last apartment I was shown, and, after a most agreeable and instructive interview with the medical director, I took my leave.

From what could be observed in a passing visit to this admirable asylum, its management and internal arrangements cannot be too highly commended. Though it presents human nature in its saddest phase, yet it is a sight no philanthropist should deny himself, provided always he can obtain the necessary permission; which is not, I apprehend, very difficult to be obtained from the skilful and courteous medical director.

The number of inmates amounted, in November 1845, to 133.

* See volume iii. p. 43, new series.

GLEANINGS FROM THE CLUB-BOOKS.

Our readers are probably aware that for some years past a considerable number of clubs or societies have been established, whose function it is to print books which are distributed among the members, the expense being borne by the general amount of their annual contributions. The principle on which these institutions have proceeded is, that supposing there are a certain number of persons curious in books of a particular class in literature, amounting in number to one, two, three, or four hundred, they may supply themselves each with one copy of any number of the books which suit their taste, through such a system, without encountering the risk of publication. It is something like a revival of the old plan of subscription—a set of men are associated, of whom each receives a copy of every work which their united funds are sufficient to print. It is probable that the system could not be made applicable to new original works, as each member would be anxious to print something written by himself, and it is not likely that the question, whether it deserved to be printed by the club, would be considered so impartially as when the author of the book has been some centuries in his grave. Accordingly, the book-clubs have in general confined themselves to reprints of old books of which the original editions have become rare, or to the printing of old manuscripts. In the system which they pursue, they practically avow that their books are not of a class capable of attracting so much public interest as to procure for them a general sale. And there is no doubt that, like all commodities prepared to suit the tastes of particular individuals, the club-books are in the mass caviare to the multitude. But among contemporary annals and diaries, old romances, specimens of ancient poetry, records of local events, and the like, which are the staple commodity of the clubs, it would be strange indeed if several hundred volumes did not afford some passages possessed of interest to general readers. In truth, there are among these rarely-opened volumes many specimens of curious narrative and adventure—delineations of customs, manners, and superstitions—incidents connected with the lives of eminent persons, and illustrations of historical events—which it were to be regretted that general readers should not have an opportunity of perusing. We therefore propose to devote a few columns to some gleanings which we have made from this neglected field.

THE ROMANCE OF SIR AMADACE.

The old metrical romances of England and Scotland, though imbued with the false morality of chivalry and the barbarism of the dark ages, yet contain many illustrations of high and pure feeling. To hold some one object as the great end of life, and to allow no cares, or sacrifices, or inferior aims to interfere with its fulfilment, is the characteristic motive of chivalry; and where the object pursued by the faithful knight is a good one, his generous devotion and contempt of all selfish impulses present us with a fine and elevating picture of the better features of human nature. In the unpublished romance which, under the title of Sir Amadace, has been printed for the Camden Society, the points of character mainly illustrated are a wife's devoted attachment, and a man's adherence to his pledged word. The bankrupt merchant denied Christian burial, and the widow watching the corrupting body to scare away the beasts of the field and the fowls of the air, as long as she has life, may not be a pleasing picture; but the minstrel who imagined such a tale of tried constancy, and the people who delighted to listen to it, had

in them something good. This romance probably furnished part of the stock in trade of those minstrels who were partly the reciters merely, partly the authors, of the verses they repeated. The manuscript, whatever may be its precise age, must have existed early in the fifteenth century, as it contains certain commemorations made by its owner during the reigns of Henry V. and VI. The structure of the poem is dramatic. The form of stanza, and in general the words used, have been preserved in the extracts which follow, and only such changes have been made as were absolutely necessary to enable an ordinary reader to follow the narrative. The initial stanzas have perhaps been lost. The reader is very abruptly introduced to a consultation between Sir Amadace and his steward, in which the latter demonstrates that his master owes more money than his lands will produce in seven years. In the present day, this would afford no great ground of alarm; the spendthrift might double such a debt before he need anticipate any immediate pecuniary difficulty. In those days, however, 'the money market was heavy,' to use a term well understood in the present age; and the steward is obliged to suggest that his lord should lay aside his state, dismiss his retinue, and have but one servant where he had ten. The knight agrees to the justice of the course, but not having courage to practise it where he is so well known, departs with a few attendants in search of adventures, all the money he has with him being forty pounds. He is then described as coming towards a chapel from which shines a light, and sending his servant on to inquire what it might mean. The servant returns—

And said, 'Sir, at yonder chapel I have been,
A selcouth sight there have I seen,
My heart is heavy as lead.
There stands a bier and candles two,
A woman sitting and no moe;
Lord! careful* is her rede.

Sore she sighs and hands wrings,
And ever she cries on heaven's kings
How long she shall be there.
She says, dear God what may that be,
The great sorrow that she upon him see,
Stinkand upon his bier.
She says she will not let him alone,
Till she fall dead down to the stone,
For his life was to her full dear.'

Sir Amadace then questions the lady himself, and—

She said, 'Sir, needlongs must I sit him by,
I'faith there will him none but I;
He was my wedded fere.'†
Then Sir Amadace said, 'Me likes full ill,
Ye are both in a plight to spill,
He lies so long on bier.
What a man in his life was he?'
'Sir, a merchant of this cité,
Had rich rents to rear;
And every year three hundred pound
Of ready money and of round,
And for debt yet lies he here.'

Then Sir Amadace said, 'For the rood,
On what manner spended he his good,
That this gate‡ is away?'
'Sir, on gentlemen and officers,
To great lords that were his peers,
He would give gifts gay;
Rich feasts would he make,
And poor men, for God's-sake,
He fed them every day;
While he had any good to take,
He was not the man for God's-sake,
That would once say nay.

Yet he did as a fool:
He clad more men against Yule
Than did a noble knight;
For his meat he would not spare,
Boards in the hall were never bare,
With clothes richly dight.
If I said he did not well;
He said, God sent it every deal,
And set my words at light.
Then he took so much upon his name,
I dare not tell you, Lord, for shame,
The goods now that he owed.

And then came Death, wo him be!
And parted my lord and me,
Left me in all the care:
When my neighbours heard tell that he sick lay,
They came to me as they best may,
Their goods asked they there;
All that ever was his and mine,
Horse and nowt, sheep and swine,
Away they drove and bare.
My dowry to my life I sold,
And all the pennies to them told,
Lord, yet owed he well more.'

She then proceeds to say that every debt was discharged save one of thirty pounds to a merchant of the city, who for this debt had arrested his body and forbidden it burial, saying that hounds should drag it to the field and gnaw the bones there. For sixteen weeks, in the lonely chapel, the widow had watched the corpse on the bier, and so she declared she would continue till death took her also. Sir Amadace ascertains the name of the merchant, comforts the lady, and departs; but sends his servant to the merchant to bring him to sup with him, when he endeavours to persuade him to forego the debt, and permit the body to be buried. The merchant is inexorable, and Sir Amadace pays him thirty pounds from his own money; the remaining ten is expended in burying the dead body. The knight then dismisses his squires, and journeys forward, penniless and alone, moralising on the miseries of poverty. Thus occupied, he is accosted by a knight all in white, riding on a milk-white steed, who questions him wherefore he goes mourning so, as if he doubted the divine Providence and its power to raise up as well as to cast down; assuring him that for good deeds done there shall be rich reward.

The white knight then questions Sir Amadace as to how he would regard the man who should bring him from this desponding and low estate to the full enjoyment of wealth and honours, and if he would be content to divide with such a one all he might gain by his means. Sir Amadace agrees to the compact, and is told of a royal king who has a fair daughter, which daughter is to be given to the knight who is first in the field and best in the tournay. He is told to go thither; that gold for his spending, and trappings, as beseems a knight, will be fully provided; that he will win all wealth and honour, and at last wed the fair lady.

Then bespoke Sir Amadace:
'An thou hast might through God's grace
So to comfort me,
Thou shalt find me true and leal,
And even, Lord, for to deal
Betwixt thee and me.'
'Farewell,' he said, 'Sir Amadace,
And thou shalt work through God's grace,
And it shall be with thee.'
Sir Amadace said, 'Have good day,
And thou shalt find me, and I may
As true as any man be!'

Sir Amadace is then represented as walking on a lonely coast, where he finds the contents of a wrecked vessel which had been cast on shore. There he finds knights in armour, and steeds white and gray; and we are induced to presume that the former were dead, as Sir Amadace strips them of their armour and rich apparel; while the latter, by an equal good fortune, must have survived the storm, as one of them becomes the knight's faithful steed. There were also coffers filled with all manner of precious things—gold and rich array. Then Sir Amadace, having robed himself full regally, was in good condition for trying his lot at the jousting, to be held in honour of the king's fair daughter. It appears that the riches thus put at the disposal of Sir Amadace had been cast on the coasts of this same king's territory. The king sends his knights to greet him; while, in order to have the best benefit of existing circumstances—

Sir Amadace said, 'I was a prince of mickle pride,
And here I had thought to ride
Forsooth at this tournay.
I was victualled with wine and flour;
Horses, harness, and armour;
Knights of good array;

* Full of care. † Companion. ‡ This way.

Strongest storms me over drave,
My noble ship it all rave.
Though sooth yourselves may say,
To spend I have enough plenté;
But all the men that came with me,
Forsooth they are away.'

This was a somewhat uncandid proceeding on the part of so peerless a knight, to say the least of it. The king, however, tells him—

'I never saw man that sat in seat,
So much of my love might get,
As thou thyself has;'

and offers to provide him with a suitable retinue and attendants, all of whom the knight rewards with great munificence; and both in the tournay and the battle-field he bears off all the honour—winning

Field and frith, town and tower,
Castle and rich cité.

Winning also the love of the king's fair daughter, who is awarded to him, with the half of the kingdom while the king lives, and the whole of it at his death.

Thus is Sir Amadace cured of his wo;
(May God lend grace that we were so!)
A royal feast caused he make;
There wedded he that ladye bright.
The eating lasted a fortnight,
With spears for to shake.
Another half-year they lived full glad;
And a fair boy-child they had;
Great mirth on that they make.
Listen now, lordings, of doings great,
While on a day before the meat,
This compeer come to the gate.

He came in as gay a gear,
Right as he an angel were,
Clad he was in white.
Unto the porter spake he so,
Said, 'To thy lord mine errand go
Hastily and right;
And if he ask ought after me,
From whence I come, or what countrie,
Say that my suit is white;
And say we have together been—
I hope full well he has me seen,
He will it never denyte.'

The servant bears the message to his master, and—

'Is he come,' he said, 'my own true frere?
To me is he both loved and dear,
As ought he well to be.
But all my men, I you command
To serve him well, both foot and hand,
Right as ye would do me.'
Then Sir Amadace unto him went,
And also did that ladye gente,
That was of hue so bright;
And did well that she ought to do,
Whom her lord loved she worshipped too,
As such a woman might.

Who should his steed to stable have,
Knight, yeoman, squire, or knave—
Neither with him he brought.
Then Sir Amadace would have taken his steed,
And to the hall himself led;
But so would he not.
He said, 'Certain the sooth to tell,
I will neither eat, drink, nor dwell,
By God that me dear bought!
But take and deal it even in two—
Give me my part, and let me go,
If I be worthy ought.'

Sir Amadace then endeavours to persuade him to remain, telling him a fortnight would not suffice to go over the rich lands and divide them. But the white knight tells him he will have neither lands nor towns, gold nor silver—

'But, by my faith, withouten strife,
Half thy child, and half thy wife,
And they shall with me gone.'

This is a very startling proposition. The grief and horror of Sir Amadace are then depicted, and how he besought,

For his love that died on tree,

that all besides might be taken, and his wife and child spared: but the white knight is inexorable, and bids him think on the covenant that he had made with in his misery.

Then out bespake that ladye bright,
Said, 'Ye shall hold that ye have hight,
By God and St Dristane.
For his love that died on tree,
Look your covenant holden be;
Your promise was full fain.
Sith Christ will that it be so,
Take and part me even in two;
Thou won me—I am thine!
God forbid that blamed you be,
Or a liar made for me,
Your honour in land to tyne.'

Still she stood withouten let,
Neither changed hue, nor gret.*
That lady mild and dear;
Bade 'Fetch me my young son me before,
For he was of my body bore,
And lay my heart full near.'
Then quoth the white knight now,
'Which of them most lovest thou?'
He said, 'My wife so dear!'
'Sith thou lovest her the more,
Thou shalt part her even before
Her white sides sear.'

Sir Amadace is frantic, his men are swooning ar him, and the lady is represented as kissing her and lying down meekly with a cloth over her The sword is uplifted, when the white knight forward, takes up the lady and the child, and gi them back to Sir Amadace—

Said, 'I could not blame thee wert thou wae,
Such a lady for to slay,
Thy honour thus would save;
Yet I was as largely glad
When thou gave all thou ever had,
My bones for to grave.
In chapel where I lay hounds' meat,
Thou paid first thirty pounds great,
Sith all that thou might'st have;
Then sought I God for thee to care,
Who for me was made so bare,
My honour in land to save.

Farewell now,' he said, 'mine own true frere,
For my lodging is no longer here,
With tongue thus I thee tell;
But love this lady as thy life,
Who thus meekly, without strife,
Thy covenant would fulfil.'
Then he went out of that town,
Gliding away as dew is stown,
And they abode there still.
They kneeled down upon their knee,
And thanked God and Mary free,
And so they had good skill.

MANNERS OF THE CHINESE COMMISSION KEYING.

THIS high official of the Chinese emperor paid a vi Hong Kong in the month of November last, and sp few days very agreeably with the British governor. *China Mail* of the 27th of that month, published at Kong, gives a lively account of the visit, and particu of two entertainments which took place on the occas one given by the governor to the commissioner, an other by the commissioner to the governor; from which it appears that an excellent understanding no isits between the Chinese and British authorities.

At the first dinner, the governor, Major-General D lar, gave as a toast the health of Keying, whom he desc as 'the enlightened statesman, the friend alike of and of England,' and one to be equally valued for po talents and social qualities. Keying made a modest and at the conclusion held out his hand to the gov as a token of friendship. We leave the China Mail the rest.

'Nothing could exceed the affability and good-hu of Keying, accompanied by the highest tact and breeding. He was jovial at dinner, but without ex and after having volunteered a Mantchow Tartar which he gave with great spirit, the company adjourn the drawing-room, where a party, consisting of the

* Cried.

of the garrison, with most of the naval and military officers, and civil residents, had assembled. Keying went the round of the room with the utmost blandness, offering his hand to each of the ladies, and distinguishing one or two of them by little presents of purses or rosaries taken from his person.

'There was one little girl in particular, about seven years of age, present, in whom Keying seemed much interested, and it was delightful to witness the good nature and benevolence of his manner when he took her upon his knee to caress her, and then placed an ornament about her neck. His fine Tartar head and person, grouped with the infant beauty of the little stranger, formed quite a picture.

'Keying retired shortly after eleven o'clock, but not till he had asked the general, with characteristic good nature, if he wished him to remain any longer, evidently desirous not to disappoint the guests, who crowded round him with a mingled feeling of respect and curiosity.

'There was another instance of high-breeding worthy of being recorded. A married lady who was sitting near him attracted a good deal of his attention, and having desired one of his attendants to bring him a silk handkerchief, he presented it to her, and begged he might retain her own in exchange for it. The lady was momentarily embarrassed, and Keying seeing this, said "he hoped he had done nothing contrary to our usages of propriety;" an apology which was immediately appreciated and understood.

'In the course of the following day, the last conference took place between the English and Chinese plenipotentiaries, and in the evening Keying gave a sumptuous entertainment in the Chinese fashion. The hour of dinner specified in the invitations, which are curiosities in their way, was six o'clock; and before that time all the guests had assembled in one of the lower rooms, except the governor, upon whose arrival being announced, Keying hurried to welcome his excellency at the landing-place, and to conduct him to a seat in the centre of the room—the rest of the company sitting in arm-chairs formally placed on either side, with a small table between each two. The half hour before dinner, proverbially dull and trying to the patience in Europe, is in China relieved by the sedulous attentions of the entertainers, and by refreshments of the finest tea, which are offered to each guest in little cups—what with us is the saucer, being made to perform the more useful office of a cover to preserve the aroma.

'Dinner being announced, the company proceeded up stairs to the sound of music, which had not the least resemblance to the "Roast Beef of Old England." A large table was set out in the spacious saloon, at the centre of which sat Keying, with Sir John Davis on his left hand, and Major-General D'Aguilar on his right; and proceeding round the table in the Chinese order, from left to right, the following, so far as we can remember, were the other guests:—Admiral Cochrane, the prefect of Canton; Chief-Justice Hulme; Lieutenant Patey, R.N.; Mr Waller, the admiral's secretary; Mr Sargent, A.D.C.* to the governor; three mandarins; Hon. Major Caine, chief magistrate; the Hon. Frederick Bruce, colonial secretary; Captain Talbot, R.N.; the Chevalier Liljevalch, Swedish commissioner; a mandarin; Mr Attorney-General Stirling; Major Aldrich; Captain D'Aguilar, military secretary to the major-general; Dr Gutslaff, Chinese secretary; a mandarin; Lord Cochrane, A.D.C. to the major-general; Captain Bruce, assistant adjutant-general; Mr Shortrede; an imperial mandarin; Lieutenant Miller, R.N., A.D.C. to the admiral; Monsieur Delessert; 'Lord John Hay, R.N.; Lieutenant Miller, R.N.; Captain Gifford, R.N.; a Tartar mandarin; Captain Lyster of the Agincourt; Mr Mercer, acting colonial treasurer; Mr Elmslie, secretary to the superintendent of trade; and his excellency Pwan-tsye-shing.

'To our readers at home, it may be interesting to have a pretty minute account of the whole *menu* of the dinner, especially as it differed in several respects from the descriptions of Du Halde, Father Bouvet, and other more modern writers. From the number of dishes successively served up, we infer that it was a feast of the "more solemn sort," spoken of by the former of these authorities; but instead of a small table for each guest, there was, as we have said, only a single large one, in the English fashion, for the whole company; and except such a general invitation to be seated as might have passed unnoticed in Europe, there were none of the ceremonious bows to individuals which Father Bouvet speaks of.

'Before each guest was placed a plate and *kwai-tz'*, or chop-sticks, on one side, and a knife, fork, and spoon on the other. The chop-sticks, however, were pretty generally used—a little awkwardly, it must be admitted, by the English; while the mandarins, probably out of politeness to their guests, occasionally made use of the fork and spoon. Beyond the plates were ranged innumerable little pyramids of preserves, pickles, and dried seeds, which, from the experiments we made, we presume were not intended to be eaten, but placed merely for show; but at the left hand there was a small saucer of sweetmeats and salted relishes, which were partaken of and washed down with a glass of wine. And then commenced the more important part of the feast, by the army of servants setting before each guest a small bowl, about the size of a moderate breakfast cup, of birds'-nest soup, which might pass for very good vermicelli at home, and scarcely merits the celebrity it has obtained, or seems worth the enormous price it is said to cost. This was the prelude to a succession of other soups, stews, and hashes, most of which were so excellent, that the genius Archæus, who, according to the fanciful Van Helmont, keeps post in the upper orifice, as a sort of custom-house officer to the stomach, to watch all contraband food, must certainly have found his occupation gone, and declared for free trade on the occasion. We can speak for ourselves, that, after having partaken of all the dishes set before us, we never rose from a table with more inward peace and satisfaction. Having made a jotting on our return home, we are enabled to give a pretty full, but by no means complete list of the messes, but without being certain under which class—soup, stew, or hash—they ought respectively to be ranged. After the birds'-nest soup there were venison soup, duck soup, never-to-be-sufficiently-praised sharks'-fin soup, chestnut soup, pork stew, a sort of vegetable pâtés, with gravy in a separate saucer; stag sinew soup, shark-skin soup, second only to his elder brother of the fin; earth-nut ragout, a gelatine soup, made, we were told, of the pith of stags' horns; macerated mushroom and chestnut soup, stewed ham, sweetened with sugar or syrup; a stew of bamboo shoots, another of fish-maws, esculents with hot sauce, slices of hot cakes and cold jam-puffs; with numerous other nondescript soups and stews, in large bowls, placed in the centre of the table, of which vegetables, pigeons' eggs, and more especially pork, seemed to be the component parts, showing Chinese cooks, like Beaumont and Fletcher's, to be "thoroughly grounded in the mysteries and hidden knowledge of all soups, sauces, and salads whatsoever." In such a labyrinth of novel dishes, even the most practised gourmand might have been excused for feeling a little at a loss: and our entertainers seemed to appreciate the circumstance, for when any particularly good mess came upon the table, they would put some upon the plates of those near them; and Keying, with the most refined Chinese politeness, more than once took a tit-bit from his own dish, and conveyed it with his chop-sticks to the honoured guests beside him. Lest there might have been any one who could not contrive to make a sumptuous dinner from such materials, there were in the centre of the table roast peacock, pheasant, and ham; and tea was several times served to relieve this active "alimentary progression"—never dreamt of by Ude or Brillat-Savarin. It is worth noting, as a remarkable circumstance, that during the whole dinner there was not a grain of rice on the table, not even mixed with other food, though almost all writers tell us it is never wanting at a Chinese dinner of any sort. If, according to Sir John Davis, the appearance of bowls of rice at such feasts is the signal of the repast approaching its termination, the party on the present occasion must have broken up long before the host was tired of his guests; for the rice signal was never given.

'There was no lack of good wines, liqueurs, and mandarin samshoo at dinner; nor were the Chinese unmindful to do due honour to them, by frequently pledging their guests; and this soon came to be no light matter, for they were never satisfied with a mere sip, but insisted on bumpers every time, and that the glass should be turned upon the table in proof of its having been honestly emptied. The effect upon themselves was scarcely perceptible, though we remarked a formidable-looking Tartar opposite where we sat, who, besides his share of champagne and other wines, discussed the greater part of a bottle of maraschino, and made serious inroads upon another of noyeau, stroking his chin, and exclaiming "Hoh!" at each glass.

'The succession of soups must have occupied nearly three hours, and when it at length came to a close, Keying rose

* Aid-du-camp.

to dedicate a cup to the queen of heaven; and forthwith a series of low benches, covered with crimson cloth, were ranged from one end of the room to the other, and were speedily loaded with roast-pig, hams, fowls, and other substantial dishes; and before each a cook, or butcher, we could not tell which, sat down *à-la-Chinois*, and taking a knife, like a cutlass, commenced slicing it down, in defiance of the maxims of the Carver's Guide, grasping the joint with the left hand, the long nails of which served for both fork and spoon. The ceremony is intended as an acknowledgment of the bounty of the queen of heaven, and is gone through before the guests, to show them that, even after the exuberance of dishes with which they have been served, there is still enough and to spare. The sliced meat was set upon the table, as were also cold mutton and pork, none of which were eaten; and then succeeded a dessert of fruits and preserves, with abundance of wine, cordials, and samshoo.

'The "most prolonged breakfast," says Sir Walter Scott, "cannot well last above an hour;" but he does not set any limits to dinners, as in his own practice he observed none. The one we are speaking of had already extended almost to four hours; and, to the best of our recollection, the more substantial food was not entirely removed when the dessert came upon the table, while the toasts, we think, had commenced beforehand. The first was "The queen of England and the emperor of China," which was drunk with tremendous applause, the Chinese being especially vociferous, huzzaing, clapping their hands, and beating the table in the most approved English public-dinner fashion, the band in the adjoining room striking up what we presume was an appropriate air, but which sounded to our ears not unlike a Highland pibroch. A few other toasts followed—amongst the rest the king of the French and the king of Sweden, each of whom had a subject among the guests; and Keying then called upon the governor for a song, as a condition to giving one himself, which he afterwards did, and very well too, and joined lustily in the applause with which it was received. Pwang-tsye-shing gave us two songs; the emperor's son-in-law excused himself on account of a hoarseness, brought on doubtless by the unwonted exercise of his lungs during the visit; and an attendant Tartar, a descendant of Genghis-khan, we were told, chanted a wild lilt, having many of the characteristics of an old Scottish or Irish air. On the part of the English guests, besides the governor, songs were sung by the major-general, the chief-justice, the Honourable Frederick Bruce, and Mr Shortrede.

'The Chinese are fond of enlivening their entertainments with shows and dramatic exhibitions, and most authors speak of these as invariable accompaniments. The present dinner was an exception, probably because visits to foreign powers never having been before dreamt of in China, players form no part of an ambassador's retinue. However, a substitute was found in a game which we do not remember ever having seen described. Two flowers (dahlias) were given to Keying, who, first twirling them round his head, and then holding them to his nose, gave one to the governor and another to the general, who were desired to hand them round the table. In the meantime a drum was kept beating in the outer room, the performer at random making a sudden stop; and the person in whose hand the flower then chanced to be found, was required to quaff off a bumper of wine. This sport, from the sort *esprit de patrie* with which it was kept up, created a good deal of amusement, the Chinese being especially mindful to watch their victims, and laughing good-humouredly when caught themselves.

'In sporting phrase, the pace of the evening had been uncommonly fast, and all "caroused potations bottle deep;" but whether it was the excellence of the drink, or the counteracting effects of the ragouts, every one, European and Chinese, seemed quite able to carry his liquor discreetly. The company broke up about eleven o'clock, Keying and the rest of the Chinese accompanying their guests down stairs, and taking leave of them at the door, both appearing to be mutually satisfied with the meeting.

'A man so famous in the western world as Keying, was of course the observed of all observers during his visit. He is, we should suppose, of some fifty years of age, his tall and majestic form being graced with manners at once dignified and courteous. His whole deportment, in short, was that of a perfectly well-bred man of the world; and but for his dress and language, he might have been taken for a fine specimen of the old English gentleman of the highest class. As we saw him on such public occasions, his bland countenance was beaming with good-humoured benevolence; but it is of an intellectual cast, and lighted up with a twinkling eye, which, as occasion demands, would be equally expressive of penetrating shrewdness as of social glee.'

FRENCH AND ENGLISH MANNERS.

The art of society is, without doubt, perfectly comprehended and completely practised in the bright metropolis of France. An Englishman cannot enter a saloon, without instantly feeling he is among a race more social than his compatriots. What, for example, is more consummate than the manner in which a French lady receives her guests? She unites graceful repose and unaffected dignity with the most amiable regard for others. She sees every one, she speaks to every one; she sees them at the right moment, she says the right thing. It is utterly impossible to detect any difference in the position of her guests by the spirit in which she welcomes them. There is, indeed, throughout every circle of Parisian society, from the 'château' to the cabaret, a sincere homage to intellect; and this without any maudlin sentiment. None sooner than the Parisians can draw the line between factitious notoriety and honest fame; or sooner distinguish between the counterfeit celebrity and the standard reputation. In England we too often alternate between a supercilious neglect of genius and a rhapsodical pursuit of quacks. In England, when a new character appears in our circles, the first question always is, 'Who is he?' In France it is, 'What is he?' In England, 'How much a-year?' In France, 'What has he done?'—*Coningsby.*

MENTAL ADAPTATION.

Wonderfully does the mind suit itself to occasions, and become accommodated to every circumstance. It will rise superior to the strokes of fortune, be happy in adversity, and serene in death. The consciousness of rectitude will not only enable it to endure evil, but divest misfortune of its every terror. Tenderness will yield to an unbending firmness, and the eye in which the tear of emotion has so often started, will disdain to weep. He who remarks the vicissitudes of fortune, and how quickly prosperity may be succeeded by a fall, can alone appreciate that property of the mind by which it becomes elevated in triumph, and extracts from adversity its hidden jewel. Not rightly allowing for the action of this property, we err often in imputing misery to the cheerful and felicity to the sad. Belisarius, blind, and the sport of his enemies, might have yet been happier than the emperor of the East. The principle of adaptation to everything which can be the lot of man, is a good genius which follows him throughout his being: and its workings are alike evident, whether you regard his mental or physical relations to the phenomena which encompass him; it is this which gives a zest to his pleasures, a solace to his cares; it gilds for him the sunbeams of the morning, and when night approaches, it 'smooths' for him 'the raven down of darkness till it smiles.'—*W. F. Barlow.*

INTELLECTUAL PRECOCITY.

A child exhibits considerable talent, as it is supposed, and perhaps a great propensity to reading. It is decided to be a little genius. Undue efforts are made to cultivate its mental powers, and this cultivation is not confined to the faculties proper to youth, but as it occasionally exhibits reasoning powers, every effort is made to cultivate these; or, in short, more or less of the class of intellectual powers. The mind is now strained, the general health is impaired, and he who was so bright at nine or ten, is stupid or an idiot when he comes to maturity.—*Memoir of the late Dr Hope.*

GENEROUS SYMPATHY.

King George II. having ordered his gardens at Kew and Richmond to be opened for the admission of the public during part of the summer, his gardener finding it troublesome to him, complained to the king that the people gathered the flowers. 'What,' said the monarch, 'are my people fond of flowers? Then plant some more.'

BABYOLATRY.

There must be a strange deficiency, either of heart or head, in the man who can look on a child with indifference or contempt. There is a poetry, a purity, a beauty about childhood, which is in this world perfectly unique; and he who cannot appreciate it, proves that his mental and moral tastes are by no means pure or elevated. Truly has the poet said, 'Heaven lies about us in our infancy;' and no one can have observed the exuberance of life in a healthy and cheerful child, its eloquent earnestness, the intense emotion beaming from its sparkling eye, its care-unwrinkled brow, its happy to-days and hopeful to-morrows, without feeling the truth of the assertion. Much is there in children calculated to render them the best companions of adults; and far more instruction and improvement may be derived from their lively prattle and pastimes than is generally imagined.

Perhaps it is this exceeding loveliness of children which makes the mind more acutely sensitive to the injudicious treatment of them, by many who are certainly old enough to know better. The thought of what they are in many families gives the greater pain, because it is so readily associated with that of what they might be. Petted, praised, worshipped, thrust upon the notice of every one, as if they could never be sufficiently regarded, these lovely little creatures are made to appear in a most unlovely aspect; and many a family circle is avoided by the intelligent, and those who do not care to be pestered by 'those children,' as they are significantly designated. Pity is it that those who have the care of them should be so injudicious and unwise: pity that little creatures capable of affording so much pleasure should be often rendered so wearisome and annoying.

That parents should love their children, even to excess, is perfectly natural and right; but when they call upon the circle of their acquaintance to worship the little gods and goddesses of their idolatry, they can scarcely wonder if the unreasonable expectation is disappointed. In some families this system of child-worship, or babyolatry, as we have termed it, commences as soon as the child is born. The nurse, who is always officiously ready to act the part of high-priest, thrusts it into your arms, and insists that the child wants to come to you. She asks you in a triumphant tone, that admits of but one answer, if you ever saw a more beautiful babe? and you are denounced as a graceless churl if you do not seize upon the opportunity of praising its every feature. And then how the baby smiles at you! It wants to kiss you, interprets the nurse, and you must kiss the child whether you will or not; nay, if you do not absolutely smother the little innocent with kisses, you are set down as a kind of ogre, a monster without human sympathies, pronounced a hopeless old bachelor, and asked if you positively dislike children. Then you must pass your opinion as to whether its eyes are most like those of papa or mamma, and you must vow that that pretty mouth is the exact counterpart of its mother's. Wo to you if you grow tired of dandling the little pet before nurse is ready to take it from you; wo to you if you manifest the slightest symptom of weariness of the precious charge committed to your keeping; and you are a fortunate man if you are not pressed into the office of godfather, and your purse lightened to make the customary presents entailed upon the office.

This species of babyolatry, however, is harmless and pardonable, compared with the grosser and more pernicious forms of it with respect to children of more advanced age. In one family, you can scarcely sit down before you must see Tom's copy-book, and hear Jane play 'Weber's Last Waltz;' and another fond foolish mother will insist on your staying to see Jem's Christmas letter, after being taught for only one 'half.' 'I see him, sir!' was the irritated answer of the great lexicographer to a foolish father who was fearful the doctor had not observed his lubberly son: and similar is the feeling of many who are continually teased into listening to Norval-spouting boys and Rossini-strumming girls, and compelled to praise what they feel to be an intolerable infliction and nuisance.

For ourselves, so much do we shrink from the annoyances inseparable from the system of babyolatry, that we generally decline an invitation when we have any reason to suppose that the party is got together in honour of some little sucking god or goddess. We were, however, to our great chagrin, entrapped a few weeks since into one of these child-worshipping assemblies, the incidents at which we shall briefly describe.

We had been invited to meet a few friends on the evening alluded to; and not being aware of the interesting fact, that a juvenile birthday was to be celebrated, in unsuspecting ignorance we were punctual to the appointment. It was soon evident, however, for what purpose the circle of a score had been formed; namely, to celebrate the birthday of the eldest Miss Dobbs, who had that day attained the interesting age of five. The company were all assembled, and many and earnest were the inquiries after the little goddess at whose shrine the worshippers were gathered, and who had not yet made her appearance; but mamma informed the company that Miss Wilhelmina would be dressed in a short time, and not without a self-complacent glance at one or two female friends, as if to intimate that their patience would be well repaid.

While Miss Wilhelmina was preparing, however, for her *entrée*, her mamma was retailing to the company her smart sayings: how shrewdly she answered her

brother Tom; how she already knew the Latin for 'mother,' and the French for 'poker;' what a wonderful idea she had of drawing; how she drew papa's likeness while he was asleep, and no bad one either; and what sage observations she made, far beyond her years; winding up her eulogy with a sigh, and pathetically expressing her fear that she should never rear her, for such clever children seldom lived to be old.

After no little whispering, and a thousand anxious inquiries, and mamma had been summoned out of the room at least a score of times in the most mysterious manner, and had as often returned to her seat with looks of no little satisfaction, the folding-doors were suddenly thrown open, and little Miss Wilhelmina Dobbs stood before the dazzled eyes of the company. She was in truth a pretty, engaging little creature, but she had been so bedizened for the occasion, that we scarcely recognised her. Her hair, which was very soft and flaxen, was plaited to hang down her back in the Chinese fashion, her pink satin dress stuck out around her like a puckered mushroom, and a blue sash of ample size trailed along the ground. Mamma gazed around upon the company with a self-gratulatory air as her darling appeared, and seemed to triumph in the admiration she fondly anticipated they must feel. Our own honest feelings, however, were too indignant to allow us to praise what we felt deserved nothing but censure; and we could not refrain from contrasting, in our own mind, the little vain creature thus burdened with tinsel and finery, and the laughing child whom we had often seen happily and innocently occupied with her playthings, seeking for no one's applause, and unconscious of any admirers. There she stood, refusing the twenty invitations to sit on the knee of some relative: she could neither move nor sit, 'because,' as she said, 'it will spoil my frock,' upon which her eyes were continually fixed, and which was evidently the all-engrossing object of her thoughts. Several friends who were present, and whom at other times she professed to love dearly, were unnoticed; many even of her little playfellows could scarcely obtain a look of recognition; and even mamma, with all her blind fondness, was compelled to chide the little pet for her inattention.

The ceremonies of the tea-table being over—at which Miss Wilhelmina was allowed to assist herself with cake and muffins so perseveringly, that at last she began to cry and complain of a severe headache—the company formed themselves into twos and threes for conversation, and as there was a pianoforte in the room, and more than one respectable performer present, music was proposed, and we congratulated ourselves on the prospect of some entertainment more rational and pleasing than what we had hitherto had. Mamma, however, seemed to think this a usurpation of the shrine of the little goddess, and, jealous for the honour of her darling, insisted that the company should hear Miss Wilhelmina sing that beautiful song her governess had taught her. This was the occasion of quite a scene between the mother and her little daughter—the mother protesting that she sung it delightfully, and the child that she had never learned the whole of it. Then followed a series of coaxings and threatenings on the one side, and sobbings and protestations on the other; and at last, after the united beseechings of the company, Miss Wilhelmina was prevailed upon to sit down to the piano. It was quite evident, however, that the poor child, who had received very little instruction in music, was totally unable to go through with her task. She had not proceeded a dozen bars before she stopped short, and protested she did not know any more; and mamma, sullen and vexed at being thus thwarted, threw herself back in her chair, muttering something about 'obstinacy,' 'could if she chose,' and seemingly determined to be throughout the evening pleased with nothing and no one. It was in vain that we tried to converse or to get up a song: now Miss Wilhelmina must dance her hornpipe; now she must hand her copy-book round to the company; now she must talk French to her uncle; in short, everything was secondary and subordinate to Miss Wilhelmina.

It was growing late, and we seized upon a pause in the performances, if we may so speak, of the little actor of the evening to rise and prepare to depart. It was evidently considered very bad to 'break up the company,' as it was termed, at this early hour; and we were assured by mamma, as an inducement to prolong our stay, that her little daughter had not displayed half her acquirements; and we were only allowed to depart after we had again sat down to hear a recitation, which was almost as miserable a failure as the song. We congratulated ourselves, when we had reached the street, on our escape, determined to be on our guard how we exposed ourselves to such annoyances for the future, and more deeply than ever impressed with the conviction, that the most amiable children may be rendered sad nuisances by parental folly and injudicious treatment, and that it is the duty of parents, while they love as fathers and mothers, not to forget to act as reasonable men and women, nor suffer their fondness for their children to degenerate into a blind and stupid babyolatry.

CROMWELL IN SCOTLAND.

Our notices of Mr Carlyle's book, *Oliver Cromwell's Letters and Speeches*, were, for lack of space, broken off at his expedition for the reduction of Ireland, which took place in 1649. Some weeks having elapsed since the appearance of those papers, a recurrence to the subject may not be tiresome to our readers, for the purpose of tracing Cromwell's career in Scotland.

It was verily a strange war that which our poor northern country chose to raise against the English Commonwealth in 1650. Sincere all along in seeking its one prime object, the establishment of the Presbyterian system, in Scotland at least, but, if possible, in England also, the Scotch were at the same time royalists after a manner; that is, they desired a king who would covenant with them for a Presbyterian church, and, in hope of obtaining this, maintained loyalty as an abstract principle in the meantime. They now, therefore, disagreed with the ruling party in England, both as being monarchists instead of republicans, and Presbyterians instead of Independents or sectaries. At the same time, they had a struggle to maintain with a party in their own country, who were loyalists or cavaliers without regard to religious matters, or with a leaning to Episcopacy or to Romanism; and, what was worst of all, the sample of royalty round which they had to rally was a person utterly disaffected to their views, or who only would pretend to conform to these for the purpose of gaining an ulterior end: it was, in short, Charles II., now a youth under twenty, entirely in the hands of debauchee malignants—that is, royalists. It is this strange mesh of opposite and incoherent principles which gives Cromwell's war in Scotland such a curious interest. A gallant thing it certainly was for a weak little country to stand up against a great one in such a contest, braving even the horrors which they had seen Cromwell enact in Ireland the preceding year, daring everything for the sake of their two principles, for the present incompatible—royalty and presbytery. Pity to see so much gallantry thrown away merely on account of that most insurmountable of all obstructions—a thoroughly false position.

With vast difficulty, and after much negotiation, the Scotch induced the young reckless Stuart to sign their covenant, and then he was brought to Scotland and set up as a puppet king, the real power remaining with the insurrectionary juntas, called the Committee of Estates and the Commission of the Kirk. What a mutual deception and self-deception! They satisfied merely to have a signature from the pretended king, though all his acts spoke of unmitigated cavalierism—he glad to get foot set in his dominions, on conditions which made him the meanest slave within their boundaries. It was necessary that Cromwell should immediately come in to settle

this irreducible case, as Mr Carlyle calls it. At the close of June (1650), he set out for the north with an army of about twenty thousand men—a common number for armies to consist of in those days—and on the 22d July he entered Scotland. Just before doing so, we find the iron general obliged to write sorrowfully to his son's father-in-law, Mayor, respecting that son's idle and extravagant life. 'I beseech you call upon him,' says the vexed father; 'I hope you will discharge my duty and your own love: you see how I am employed. *I need pity.* I know what I feel. Great place and business in the world is not worth the looking after: I should have no comfort in mine, but that my hope is in the Lord's presence.' It is touching to hear these moans from the spirit of a man who to the world appeared as riding high in a position of great glory. Yet immediately thereafter something droll occurs. While lying at Mordington House, near Berwick, some of the officers, including the general, hearing a great shout among the soldiers, looked out of the windows. 'They spied,' says Whitlocke, 'a soldier with a Scotch kirn (churn) on his head. Some of them had been purveying abroad, and had found a vessel filled with Scotch cream: bringing the reversion of it to their tents, some got dishfuls, and some hatfuls; and the cream being now low in the vessel, one fellow would have a modest drink, and so lifts the kirn to his mouth; but another canting it up, it falls over his head, and the man is lost in it—all the cream trickles down his apparel, and his head fast in the tub! This was a merriment to the officers: as Oliver loved an innocent jest.'

Cromwell, advancing into the country, found it in a great measure desolated, and that a good army lay posted very strongly between Edinburgh and Leith to oppose his further progress. Their policy was to weary and starve him out; and it had nearly proved effectual. Meanwhile, declarations and counter-declarations, exhibiting their contending principles, issued from both parties. Cromwell accuses the kirk commissioners of concealing his papers from their people, and adds, 'Send as many of your papers as you please amongst ours: they have a free passage. I fear them not. What is of God in them, would it might be embraced and received!' Then he says, 'I am persuaded that divers of you who lead the people, have laboured to build yourselves in these things [king and covenant]; wherein you have censured others, and established yourselves "upon the word of God." Is it therefore infallibly agreeable to the word of God all that *you* say? I beseech you, in the bowels of Christ, think it possible you may be mistaken. . . . There may be a carnal confidence upon misunderstood and misapplied precepts, which may be called spiritual drunkenness; there may be a covenant made with death and hell!' There is signal power in the language of Cromwell at this crisis: hear again what he sent from his camp near the Pentland Hills, in answer to a declaration from the kirk, indorsed by the states:—'But that, under the pretence of the covenant, mistaken and wrested from the most native intent and equity thereof, a king should be taken in by you, to be imposed upon us; and this "be" called "the cause of God and the kingdom;" and this done upon "the satisfaction of God's people in both nations," as is alleged—together with a disowning of malignants; although he who is the head of them, in whom all their hope and comfort lies, be received; who at this very instant hath a Popish army fighting for and under him in Ireland; hath Prince Rupert, a man who hath had his hand deep in the blood of many innocent men of England, now at the head of our ships, stolen from us upon a malignant account; hath the French and Irish ships daily making depredations on our coasts; and strong combinations by the malignants in England, to raise armies in our bowels, by virtue of his commissions, who hath of late issued out very many to that purpose. How the "godly" interest you pretend you have received him upon, and the malignant interests in their ends and consequences "all" centering in this man, can be secured, we cannot discern! And how we should believe, that whilst known and notorious malignants are fighting and plotting against us on the one hand, and you declaring for him on the other, it should *not* be an "espousing of a malignant party's quarrel or interest," but be a mere "fighting upon former grounds and principles, and in defence of the cause of God and the kingdoms, as hath been these twelve years last past," as you say; how this should be "for the security and satisfaction of God's people in both nations," or "how" the opposing of this should render us enemies to the godly with you, we cannot well understand. Especially considering that all these malignants take their confidence and encouragement from the late transactions of your kirk and state with your king.' The advantage which Cromwell had in the clearness of his position over the Scotch, with their 'irreducible case,' is here remarkably shown.

After several weeks had been spent in vain skirmishes (in most of which, however, the English were victors), Cromwell was obliged, by want of provisions and by sickness, to draw back to Dunbar, whither the Scotch followed him. Here, with a reduced and sickened army, he was sadly hemmed in by the goodly host of the enemy, lying upon the slopes of the celebrated Doon Hill, all the passes into England closed against him. It was a terrible strait; but his genius broke through it. On the evening of the 2d September, walking in the garden of Broxburn House, near Dunbar (his quarters for the time), the English general observed the Scotch descending towards him, presenting their right wing to his position, while the bulk of their army took ground behind, between the hill and the deep-cut channel of the rivulet Brock. Mr Carlyle doubts the famous story of the clergymen having urged General Lesley to this course against his will: he rather attributes it to the discomfort of a bivouac in bad weather on that hill overlooking the sea. However it was, Cromwell instantly perceived the advantage of bringing his whole force on the right wing of the Scotch, trusting to throw it back upon their foot, and thus produce their destruction. Next morning, before sunrise, it was done. Mr Carlyle's description of the battle is uncommonly animated:—

'We English have some tents; the Scots have none. The hoarse sea moans bodeful, swinging low and heavy against these whinstone bays; the sea and the tempests are abroad; all else asleep but we—and there is One that rides on the wings of the wind.

'Towards three in the morning the Scotch foot, by order of a major-general say some, extinguish their matches, all but two in a company; cower under the corn-shocks, seeking some imperfect shelter and sleep. Be wakeful, ye English; watch and pray, and keep your powder dry. About four o'clock comes order to my pudding-headed Yorkshire friend [a private chronicler named Hodgson, whom Mr Carlyle chooses to describe by this phrase] that his regiment must mount and march straightway: his and various other regiments march, pouring swiftly to the left to Brocksmouth House, to the pass over the Brock. With overpowering force let us storm the Scots right wing there; beat that, and all are beaten. Major Hodgson riding along, heard, he says, "a cornet praying in the night;" a company of poor men, I think, making worship there, under the void heaven, before battle joined. Major Hodgson, giving his charge to a brother officer, turned aside to listen for a minute, and worship and pray along with them; haply his last prayer on this earth, as it might prove to be. But no: this cornet prayed with such effusion, as was wonderful; and imparted strength to my Yorkshire friend, who strengthened his men by telling them of it. And the heavens, in their mercy, I think, have opened us a way of deliverance! The moon gleams out, hard and blue, riding among hail-clouds; and over St Abb's Head a streak of dawn is rising.

'And now is the hour when the attack should be, and no Lambert is yet here. He is ordering the line far to the right yet; and Oliver, occasionally in Hodgson's

hearing, is impatient for him. The Scots, too, on this wing are awake, thinking to surprise us. There is their trumpet sounding—we heard it once; and Lambert, who was to lead the attack, is not here. The Lord-General is impatient: behold Lambert at last! The trumpets peal, shattering with fierce clangor Night's silence: the cannons awaken along all the line: "The Lord of Hosts!—the Lord of Hosts!" On, my brave ones; on!

'The dispute "on this right wing was hot and stiff for three quarters of an hour." Plenty of fire from field-pieces, snap-hances, matchlocks, entertains the Scotch main battle across the Brock: poor stiffened men, roused from the corn-shocks with their matches all out! But here on the right, their horse, "with lancers in the front rank," charge desperately; drive us back across the hollow of the rivulet—back a little: but the Lord gives us courage, and we storm home again, horse and foot, upon them, with a shock like tornado tempests; break them, beat them, drive them all adrift. "Some fled towards Copperspath, but most across their own foot." Their own poor foot, whose matches were hardly well alight yet! Poor men, it was a terrible awakening for them: field-pieces and charge of foot across the Brocksburn: and now here is their own horse in mad panic trampling them to death. Above three thousand killed upon the place. "I never saw such a charge of foot and horse," says one; nor did I. Oliver was still near to Yorkshire Hodgson when the shock succeeded: Hodgson heard him say, "They run! I profess they run!" And over St Abb's Head and the German Ocean just then bursts the first gleam of the level sun upon us; and I heard Nol say, in the words of the Psalmist, "Let God arise, let his enemies be scattered."

'Even so. The Scotch army is shivered to utter ruin; rushes, in tumultuous wreck, hither, thither; to Belhaven, or, in their distraction, even to Dunbar: the chase goes as far as Haddington, led by Hacker. "The Lord-General made a halt," says Hodgson, "and sang the hundred-and-seventeenth psalm," till our horse could gather for the chase. Hundred-and-seventeenth psalm at the foot of the Doon Hill; there we uplift it, to the tune of Bangor, or some still higher score, and roll it strong and great against the sky:—

O give ye praise unto the Lord,
All nations that be;
Likewise, ye people all, accord
His name to magnify.

For great to us-ward ever are
His loving-kindnesses;
His truth endures for evermore:
The Lord O do ye bless.

And now to the chase again.

'The prisoners are ten thousand—all the foot in a mass. Many dignitaries are taken; not a few are slain; of whom see printed lists—full of blunders.'

The day after all this we have Cromwell writing to his son's father-in-law—'I pray tell Doll [his son's wife] I do not forget her nor her little brat.' He is curious to know if she is likely to bring him a second grandchild, while perhaps busied with the disposal of the ten thousand prisoners, many of whom have to face slavery in the Bermudas.

The affair at Dunbar broke the prime strength of the Scotch: it gave the capital to Cromwell; but they could still make a stout front for the young king, by taking in the less pure Presbyterians and the king's more immediate friends. The English general addressed himself to the siege of Edinburgh castle; but first, finding the city clergy secluded there, he invited them to come out and minister to their flocks. This gave rise to a curious correspondence through the medium of the governor, Dundas. Their answer was, 'that though they are ready to be spent in their Master's service, and to refuse no suffering, so they may fulfil their ministry with joy, yet perceiving the persecution to be personal, by the practice of your party upon the ministers of Christ in England and Ireland, and in the kingdom of Scotland since your unjust invasion thereof, and finding nothing expressed in yours whereupon to build any security for their persons while they are there, and for their return hither, they are resolved to reserve themselves for better times, and to wait upon Him who hath hidden His face for a while from the sons of Jacob.' Cromwell told them in reply, that 'if their Master's service were chiefly in their eye,' they would less fear suffering. 'The ministers in England,' he said, 'are supported, and have liberty to preach the gospel; though not to rail, nor, under pretence thereof, to overtop the civil power, or debase it as they please.' As to the unjust invasion they spoke of, time was when a Scotch army invaded England: on the reasons of it, 'the Lord hath heard us, though you would not, upon as solemn an appeal as any experience can parallel.' Finally, the Lord's hiding his face from the so-called sons of Jacob is no wonder, 'when he hath lifted up his hand so eminently against a family so often as he hath done against this [the Stuarts], and men will not see his hand.' The Scotch clergy, says Mr Carlyle, never got such a reprimand since they first took ordination!

They returned, however, to the charge. It could be no imaginary fear of suffering when so many ministers were deprived of their benefices, sequestrated, and forced to flee. It savoured not of liberty to preach the gospel, when the preachers were forbidden to speak against the sins and enormities of civil powers. And as to the 'solemn appeal,' 'they have not so learned Christ as to hang the equity of their cause upon events.' So it was in brief.

Cromwell, because he was 'at some reasonable leisure,' again replied, and at considerable length, defending himself first as to his concern with their covenant. 'If these gentlemen,' he says, 'do assume to themselves to be the infallible expositors of the covenant, as they do too much to their auditories "to be the infallible expositors" of the Scriptures "also," counting a different sense and judgment from theirs breach of covenant and heresy—no marvel they judge of others so authoritatively and severely. But we have not so learned Christ. We look at ministers as helpers of, not lords over, God's people. I appeal to their consciences whether any "person" trying their doctrines, and dissenting, shall not incur the censure of sectary? And what is this but to deny Christians their liberty, and assume the infallible chair? What doth he whom we would not be likened unto [the Pope] do more than this?'

The other defences can find no room here. At last he comes to the solemn appeal:—'Did you not,' he says, 'solemnly appeal and pray? Did not we do so too? And ought not you and we to think, with fear and trembling, of the hand of the great God in this mighty and strange appearance of his; instead of slightly calling it an "event?" Were not both your and our expectations renewed from time to time, whilst we waited upon God, to see which way he would manifest himself upon our appeals? And shall we, after all these our prayers, fastings, tears, expectations, and solemn appeals, call these bare "events?" The Lord pity you.' More there is to the like purpose; all insufficient, however, to convince men in their position. With one sulky rejoinder, the correspondence closed. Cromwell soon after reduced the castle by force.

The war was kept up, but with little action, for nearly a twelvemonth. The English commander acted with humanity in his general dealings with Scotland, mourning all the time the obduracy which had beset men whose religious feelings he knew how to honour. He even succeeded in overcoming the prejudices of several of the more sincere people: some became sensible of the absurdity of fighting for an idea of loyalty with such a special object as the young king before them. While the final event was pending, about the 1st of May 1651, Cromwell chanced, on his way to the west, to pass the old house of Allantoun, and there inquired for a guide. This place is now a pattern of sylvan beauty, through the tasteful exertions of the late proprietor, Sir Henry

Steuart. It was then, Mr Carlyle thinks, a lean, turreted, angry, old stone house, standing in some green place in the alluvial hollows of the Aughter Burn or its tributaries. [He is quite wrong in his description; but this is no matter.] The then Sir Walter Steuart, being a loyal Covenanter, had fled, and none were in the house but his lady and one invalid son, who was afterwards, for a reason to be detailed, called the Captain of Allantoun. To pursue the narrative of a gentleman of an ensuing generation (*Coltness Collections*)—'He [Cromwell] found the road through Auchtermuir not practicable for carriages; and upon his return, he called in at Sir Walter's house. There was none to entertain him but the lady and Sir Walter's sickly son. The good woman was as much for the king and royal family as her husband; but she offered the general the civilities of her house, and a glass of canary was presented. The general observed the forms of these times (I have it from good authority), and he asked a blessing in a long pathetic grace before the cup went round; he drank his good wishes for the family, and asked for Sir Walter; and was pleased to say his mother was a Stewart's daughter, and he had a relation to the name. All passed easy; and our James, being a lad of ten years, came so near as to handle the hilt of one of the swords: upon which Oliver stroked his head, saying, "You are my little captain;" and this was all the commission our captain of Allantoun ever had.

'The general called for some of his own wines for himself and other officers, and would have the lady try his wine; and was so humane, when he saw the young gentleman so *maigre* and indisposed, he said changing the climate might do good, and the south of France, Montpellier, was the place.

'Amidst all this humanity and politeness he omitted not, in person, to return thanks to God in a pointed grace after his repast; and after this, hasted on his return to join the army. The lady had been a strenuous royalist, and her son a captain in command at Dunbar; yet upon this interview with the general she abated much of her zeal. She said she was sure Cromwell was one who feared God, and had that fear in him, and the true interest of religion at heart. A story of this kind is no idle digression; it has some small connexion with the family concerns, and shows some little of the genius of these distracted times.'

At length the war was brought to a close in an unexpected manner. The Scottish army, having its supplies from the north cut off by Cromwell taking possession of Perth, decamped from Stirling, and entered England, where it was expected many royalists would join them. Cromwell pursued in hot haste: they got no accessions—took possession of Worcester, and there were crushed to pieces on the anniversary of the fight at Dunbar. The consequence was, the reduction of the kingdom of Scotland to the English Commonwealth.

'SKETCHES FROM FLEMISH LIFE.'

A NEAT volume, illustrated with a large number of spirited wood-engravings, has lately appeared under this title, purporting to be translations from the Flemish of Hendrik Conscience.* Amongst the few authors who write in their native Flemish tongue, Conscience, we are informed, holds a prominent position. 'A fiery patriot,' observes his translator, 'who delights in the great performances of his forefathers; an ardent admirer of his own native idiom, to elevate which he devotes the energy of his powerful mind, and the effusions of his rich poetical vein: he bears a glowing hatred to the French refinement and language, which have kept his beloved country in disgraceful subserviency and mental bondage.'

In his wish to disengage his countrymen from the ascendancy of the Celts, as he does not hesitate to call the French, Mynheer Conscience spares no kind of ridicule; and in describing the sorrows which afflict families overcome by the Gallophobia, he touches pathetically on a simple state of manners which, he says, is fast disappearing in Flanders. On this account the book may be viewed as a curious, if not melancholy revelation of patriotic feeling. Belgium, though politically independent, is socially only a fragment of France. As every one who has visited it must be aware, it is overrun with French manners, language, literature, and theatricals. Nor do we see how such a catastrophe could have been averted: we fear not by the occasional publication of a few stories such as the present, much as these tend to unmask vice and folly, and inculcate the more kindly and domestic affections. Deeply appreciating, however, the principles which have guided Conscience in his exertions, we trust that he will not be altogether unsuccessful; and that if his countrymen do permanently adopt a language and literature which he seems to detest, they will at least repudiate the manners and morals which too frequently accompany them. Conscience thus commences his tale of *Siska van Roosemael*:—

'Not many years ago you might have seen, in one of the streets behind the green churchyard of Antwerp, a famous old grocer's shop, which, through many generations, had descended from father to son, and always been conspicuous for good wares.' The last occupants of the establishment were James Van Roosemael and his wife Siska. Trained from early youth to a life of industry, this wedded pair 'had never found time to take part in the progress of modern civilisation; or, in other words, to *Frenchify* themselves. Their dress, made of stout cloth, was plain, and hardly ever changed its cut; they merely distinguished working-dress, Sunday-dress, and Easter-dress. The latter was never taken from the cupboard but on the great holidays, or when the Van Roosemaels took the holy communion, or were invited by friends as god-parents or marriage guests. It was easily to be seen that these simple people of the old Flemish world, in their quaint though goodly attire, looked rather strangely if compared with many a beau who, for a few francs, had decked himself out in a fine showy dress, and would, in passing, regard the Van Roosemaels with disdain. But they did not mind it, and thought, "Every man has his own point to gain—you the shadow, we the substance." They were sufficiently uneducated not to know that gentlefolks do not dine at noon, and they therefore were vulgar enough to sit down to dinner when the clock struck twelve; yea more, they never forgot to say grace both before and after dinner. But there were other imperfections with which they might also be charged: for instance, they did not understand a word of French, and had never felt the want of this accomplishment: they were religious, industrious, humble, and, above all, peaceable.

'The old Van Roosemaels had a young daughter called Siska, after her mother, of the age of fifteen, tall and slender for her years, with handsome figure and features, fair hair and blue eyes—a genuine, charming Brabantish child. She had been educated at a common town school, knew her native language, besides arithmetic, and all that sort of work which a good burgher's wife ought to understand, if it be only to know something more about domestic management than her servant. Like her parents, she was simple, pious, obedient, affectionate; not boisterous, idle, or self-willed, but in every way calculated to maintain, with the man she should marry, the honour and renown of the house of her ancestors, and to carry on the famous grocery shop.'

This happy old-fashioned concern was at length blown up by a distressing family disaster. In the neighbourhood of Roosemael's shop lived a master shoemaker, named Spinael, who became afflicted with a taste for French manners, knocked his two street windows into one large showy front, and stuck up a variety of lying announcements of his wares in French—'*Magasin de Bottes et Souliers de Paris*' (Depôt of Paris Boots and Shoes), '*Veritable Cirage Anglais*' (Genuine English Blacking), and so forth. A change so contrary to old prejudices shocked Roosemael, who was sorry to find that Siska had become an admiring acquaintance of Spinael's daughter, Therese, just returned from a French pension or boarding-school. Anxious to emu-

* London: Longman and Company. 1846.

late Therese in her accomplishments, Siska was desirous of proceeding to the same pension; a thing her mother sillily encouraged, but which Van Roosemael loudly protested against. A discussion ensues, in which Dr Pelkmans, the physician and friend of the family, is consulted.

'"I know very well," said Mrs Van Roosemael, "that you bear a great hatred to everything French; but we are of the old world, friend. It wont do now-a-days."

"Mrs Van Roosemael," said the doctor, "you wont understand me. It is not my intention to hinder anybody from acquiring foreign languages: this you may see in the case of my own son Lewis, who is now at the university. Does he not understand French? I should say so; and a good deal better than the young ignoramuses who turn Therese Spinael's head, and dazzle your eyes so very much. Do not look at me, madam, with such an air of defiance. Yes, they are ignoramuses; for what does their knowledge consist in? Some French sentences picked up in the street, which they often bungle lamentably enough. They do not know their native language; and they are ignorant of the very names of the most useful sciences. All their learning consists in French wind; in words and phrases which they now and then pick up in newspapers and novels. These they concoct into empty idle talk, and palm it on the uninformed for French cultivation. But you really make me quite angry; we are wandering from the point. Let us come to an understanding. I will tell you, and mark my words! There are no doubt good educational establishments, but there are far more bad than good ones. The good ones are those conducted by ladies, who, conscious of the holiness of their calling, have a better end in view than to give to their charges a shining worldly varnish, at the expense of their piety and morals; where the teachers assiduously co-operate and watch incessantly to guard against the poison of temptation, and to combat vanity and frivolity; where there is a due appreciation of the good qualities that have their root in a patriotic sentiment, and a perception of the danger of giving up this pure ground to foreign influence; in a word, where they do not wish to form fashionable ladies, but good and useful housewives. If you should now propose to send your Siska to such an establishment, I should be the last to object; on the contrary, I should be very glad of it."'

Prompted by this reasonable advice, the father gives permission that his daughter shall go to one of the establishments recommended by Dr Pelkmans; but in the end, the mother and daughter bring matters to a different point. Siska is sent to the fashionable French pension which had turned out the accomplished Mademoiselle Spinael. One of the first things which she effected in the way of personal improvement in this school of manners, was the changing of her name to Eudoxie, as being more elegant than Siska; but this, which was communicated to her mother by letter, could not yet be mentioned to the father, for fear of the consequences. In her schoolfellows she had a hundred teachers, who, by precept and example, 'instructed her in the precious arts of indolence and luxury. The first month, she had a silk gown in the newest fashion; the second, a silk bonnet with flowers; the third, a parasol; the fourth, a gown that exposed her neck; in the fifth she began to use pomatum and the milk of almonds, and kept a small box, wherein she now and then dipped her fingers, to tinge her blooming cheeks with shameless rouge, merely to try how it would look. Was not this a respectable education befitting a burgher's daughter? No doubt it was!'

While Siska was in the course of demoralisation at the distant pension, Van Roosemael is shocked to learn that his neighbour Spinael, for whom he had once entertained some regard, was utterly ruined by the young would-be-French gentlemen who frequented his shop; they had, with all their friendship for Spinael and his family, very rarely paid their debts; and at the close of each theatrical season, the comedians 'bolted,' well provided with unpaid-for boots and shoes. To make matters worse, the Flemish customers had forgotten the way to his gaudy shop: in a word, he was a ruined man, while the behaviour of his daughter had almost broken his heart.

Alarmed with the fate of his unfortunate neighbour, father Van Roosemael now insists on recalling his daughter; and Siska is accordingly ordered home. The mother, anxious to see her child, hastens to the railway terminus to receive her. She scrutinises different females who pass by; all the omnibuses have departed for the town, and all is silence around.

'Mother Van Roosemael sees the gates close; deep sorrow is swelling her heart; a painful sigh escapes from her bosom; she has not seen her dear Siska: still she remains, as if a secret power fixed her to the gate; and long would she perhaps have remained there, lost in sad meditation, if she had not seen at a little distance a young lady standing near a cab, in the attitude of one who was waiting for somebody. Could she be her Siska? Impossible! She is a young lady of quality; her splendid silk gown leaves bare a great part of her neck; a gauze shawl, to be sure, seems intended to cover, but does not conceal it; at each movement long ringlets are dancing round her cheeks; from her costly bonnet a grand plume of feathers is waving; her hand holds a pretty little parasol; a score of boxes, of various shapes and sizes, and two large trunks, are piled at her feet. That is not Siska!

'Such are the observations which Mother Van Roosemael is making, and the thought that creeps into her afflicted mind. Suddenly the young lady makes a sign of impatience in the direction of the matron, and, in doing so, shows her features more distinctly. Yes, it is Siska: and look! the old stiff mother jumps towards her like a young girl; tears gush from her eyes, a smile brightens her features, she opens her arms, and ejaculates with touching joy, "Oh, Siska, my child!"

'But it seems that the young lady is ashamed of the name Siska: she blushes. But the blush soon passes over, and she takes two steps up to her mother, who tries to throw both arms round the neck of her child. But see! the Frenchified daughter will not make a scene for the spectators; she seizes the hands of her mother, holds them, and by this means prevents the embrace. Then she says, "Good-day, mamma; how do you do? and how is papa? Take care, you will tread upon my boxes. I have been waiting here for you the last half hour."

'Under different circumstances, such frigid, heartless words might have passed unnoticed; but in the present moment they pierced, like so many daggers, the loving heart of the mother. And was this, in truth, the language she was entitled to expect from her Siska after a separation of a whole year? Not a single kiss, not one pressure of the hand for her who, to comply with Siska's will, had for three long years lived in discord with her good husband?—for her who had founded all her hopes on the love of her only child? How must this formal behaviour have pained her! The poor old lady with both hands covered her eyes, and burst into bitter tears!'

'In going into the town, a young gentleman [the dressed-up idle son of an old barber] addressed Siska with smiling face, and with such an air of intimacy, that one might have thought they were brother and sister. Mrs Van Roosemael opened her eyes as wide as possible, to see if she could recognise the young man; in vain—she never had seen him before. But he was not at all disconcerted by the piercing glance of the mother, but stepped close up to Siska, and said, with pinched lips, in French, "Ah! bon jour, Mademoiselle Eudoxie! So you have left the pension? Antwerp will now have the felicity of possessing so bewitching a creature within its walls! Verily, a precious gain for us poor young men, who are bemoaning the scarcity of such a union of attractions!" On this, Siska, casting a loving glance upon him from beneath her eyelashes, and at the same time assuming an appearance of confusion, replied, "You are in jest, Mr George! But how is your sister Clotilda?" "Oh, very well indeed," said the young gentleman with a great deal of indifference; then, with an ironical expression in his features, and pointing to the old lady, he said, "Is this your servant?"

'This question made Siska colour all over. She was ashamed of her good mother, the Frenchified doll! Her confusion lasted some time; and at last, with great embarrassment and unwillingness, she replied, "No; she is my mother!"

"Ah! indeed!" the young man exclaimed; and, turning to the mother, he bowed stiffly, and said, "Will you permit me to make you my compliments, Madame Van Rosmal? You have got a charming daughter!"

'The old lady did not understand him, but she saw clearly enough what was going on, and that she was the subject of his impudent mockery. She nevertheless returned his bow by a movement of her head. The young man took his leave, with these words to Siska, "Poor woman! she is quite right in sheltering you under her wide cloak. There are so many of us who have a great mind to steal you. *Au revoir, Mademoiselle Eudoxie!*"'

The anxious mother was bewildered with sad forebodings as she took her way homewards with her daughter. Van Roosemael was busy grinding coffee when Siska entered the shop, and, as no stranger's eyes were present, she did not disdain to show some mark of affection.

'An hour afterwards, the young lady had locked herself up in her own room, and was busily employed in unpacking her many bonnets and dresses, arranging her pomatum pots and scent bottles, and papering her curls—her voice all the time resounding through the house with a French song. The father stood confused behind his counter; his right hand rested on the handle of the coffee-mill, and with the left he scratched his head, like a helpless man; his eyes stared vacantly into the shop; painful reflections engrossed his mind. He, too, thought of Therese Spinael, and murmured from time to time, "What an ass I have been! I had better have broken the head of my obstinate wife! Dr Pelkmans spoke the truth when he said that I would one day scratch my head. But complaints are of no avail now; they are bad plasters for death!" The state of the poor mother was a wretched one: tortured by fears, anxieties, and pangs of conscience, she sat in a half-dark corner of her kitchen, and shed bitter tears, proportionate to her gloomy thoughts.'

The author's description of the domestic and commercial changes effected in the establishment of the Van Roosemaels by the refined daughter, is at once serio-comic and highly natural.

'From the first day of her return to the paternal roof, Siska criticised and found fault with everything under it. All that her good parents did, she found vulgar and improper; and as she was well versed in all the tricks and arts of dissimulation, she moulded and bent the will of her parents like softened wax.

'How could she dine at three o'clock? Had she the stomach of a peasant? At this declaration the father grew angry, the mother grieved, because all their lifetime they had dined at this their wonted hour, and were afraid of a change which would entirely upset their arrangements for the day. Siska became sulky, and looked sour; but there was no help for it. Her father showed himself inexorable on this matter. Siska wept until her eyes were red; this, too, was of no avail, although the fond mother, from mere pity, now supported her. Then Siska began to swoon; she fell into violent hysterics, and behaved as though about to leave the world. A Frenchified physician, expert in the capricious maladies of highly-educated ladies, knew how to narrate so many horrors, caused by exciting the weak nerves of the female sex, that the frightened parents at last resolved to change their hour of dining. Often did they now endure craving hunger, as, regularly rising at four or five o'clock in the morning, they had to pass so many hours, whilst the lazy, comfort-loving Siska, never made her appearance before nine o'clock.

'And then the kitchen—what miserable cookery! Nothing but potatoes, and cabbage, and beef boiled or roast: always the same. Siska, of late, feels so very weak, so very poorly! She must have a pigeon or a roast fowl; such things will be a relish, and agree better with her. Her pockets are always full of peppermint and lemon lozenges; and not without reason, for the poor child has got so many different aches—stomach-ache, heart-ache, head-ache, nervous-ache, ache everywhere. Alas, poor Siska!

'And see! she has forced her mother to exchange her laced cap for a silk bonnet, and to wear lace-boots, otherwise she must decline showing herself anywhere with her in public. But how unhappy Mother Van Roosemael looks in her new head-dress! It frets her ears perpetually, for she is not accustomed to the rustling of the stiff bonnet lining; and more than this, she can scarce advance three steps without making movements with her lace-boots like one entangled in a noose, so averse are the laces to make acquaintance with her feet. Poor woman! her neighbours laugh while she is perspiring from vexation, and for very shame could sink into the earth. But forget not the beautiful source of her patience; it is the mother's love enduring all things for her child.'

Siska had more difficulty in revolutionising the old-fashioned shop.

'Behind the counter Van Roosemael had grown up; yonder the chair stood upon which his mother had nursed him; that gaily-painted jar, and that japanned box, he had smiled at before he could speak. There was no crack, no mark, which did not awaken some fond juvenile recollections. With regard to that broken china pot, his father had given it to him a day before his death, with so striking an admonition on economy, that it was even now indelibly impressed on his memory. The black spots on that green cask yonder came from his own little hands, because that was the cask from which his mother had frequently given him a piece of sugar; and the child, therefore, had been in the habit of patting and caressing it. Yonder, on that table, the initials "J. S." are cut; they mean John and Siska, and are in commemoration of his first and only love. In short, this shop was the place of his birth—his world; everything in it was a part of himself, of his very life.'

Twelve months of remonstrances, tears, and sulkiness, bring old Van Roosemael to reason. Like a beaten soldier, he retreats, and leaves Siska the field. What a moment for the old Fleming when he uttered the words, 'Well, then, have your will!'

'But these words—like his own sentence of death—pierced him to the heart, and broke up both mind and body. He began to pine away, became pale and weak, and was apparently tottering into his grave from some unknown disease. Siska often shook like a willow when the flashing eye of her old father caught her own. But he did not speak—the broken-hearted man; he stared motionless at the workmen who were busy knocking the old shop down. All his dearest recollections he saw destroyed; and in proportion as they were vanishing under the brush of the painter, his breath and his life grew shorter. The simple shop was very soon transformed into a magnificent warehouse; everything glittered with gilding and varnish; the counter was ornamented with little angels that ground coffee, smoked cigars, or weighed tobacco; the window-panes were as large as mirrors, and covered with French inscriptions, lighted with bright gas-lamps. A shopman and an assistant stood behind the counter with folded arms; and Siska, or rather Mademoiselle Eudoxie Van Rosmal, sat on a little elevation near the window, and read French novels.'

Alas for the conclusion of this melancholy struggle! Van Roosemael, broken-hearted, takes to bed, and is at the point of death; and good Dr Pelkmans, roused to indignation by the illness of his friend, horrifies the degenerate daughter by the exclamation that her father is dying, and that she alone has murdered him. The closing scene of the dying grocer brings out the author's powers in the pathetic, in which he seems to excel as well as in the ludicrous. But this we must necessarily pass over, and likewise the account of the deep contrition of both mother and daughter. The shop of a hundred years' standing, long the nestling-place of the Van Roosemaels, was shut up.

'I venture to hope, indulgent reader,' adds Hendrik Conscience in conclusion, 'that this true narrative may have engaged your attention; and you are perhaps anxious to see Siska? Well, then, if such be your desire, go on a Friday morning, at about six o'clock, or perhaps a little later, to the church of the Dominicans; open the door on the right, and walk through the old churchyard as far as the Mount Calvary and the vaults where are represented the torments of the souls in purgatory. There you will see a young woman kneeling, wrapped in a dark cloak, and her face covered by a veil. If you look attentively, you will observe the beads of a rosary gliding through her fingers, and now and then hear a sigh rising from under the veil as from a contrite spirit. She kneels, however, motionless, and, in the twilight of the chapel, will appear to you like a statue. If, then, you see her rising and pressing a fervent kiss upon the hand of the beseeching image of a tormented sinner that is placed there, and slowly leaving the vaults without having observed you, then you may boldly assert that you saw Siska Van Roosemael.'

Considering this work to be an agreeable accession to English literature, we shall be glad to see other productions by the same author, and from the pen of the same able translator. Few volumes are more worthy of being laid on the parlour-table than the Flemish Sketches of Hendrik Conscience.

A GLANCE AT ASSOCIATIONS.

We are not aware how constantly we are influenced by association of ideas. When we reflect on the subject, it is surprising to find how it pervades the most trifling conversation. Absent objects are continually associated with present ones, and animate with inanimate, so that a phraseology has actually been established which is in the mouth of every one. Thus we say of an unfeeling person, that his heart is as hard as a stone; of a tall awkward girl, that she is quite a Maypole of a girl; of a stupid man, that he is wooden-headed; and of a violent one, that he is a firebrand: but the examples are innumerable which are every moment used in common parlance.

Every one has felt how intimately connected with the warmest emotions of the mind those objects are which gave delight in early youth. How often has a tuft of primroses, or a hawthorn hedge, awakened recollections that had long slumbered in the hidden recesses of the heart, and called forth a sigh for the raptures of childhood and all its innocent pleasures! How vividly are the feelings excited by some object closely associated in the mind with the memory of the absent or the dead! How fondly the affections and the sympathies—turning from a world all too cold—gush forth, as it were, to meet a responsive feeling in some oft-frequented haunt, or to catch the tenderness of some loving heart in a well-known melody! Home—the love of which may be said to be inherent in our very nature—is so intimately associated in our imaginations with all the dear domestic ties and charities of life, that however rugged and rude it may be, it has charms for us which the most favoured spot could never boast, and that not only when all who made it dear are still its inmates, but even when they are removed by distance or by death.

The effect of music is so great, so powerfully associated with every feeling, whether gay or sad, desponding or triumphant, that it would be almost superfluous to dwell upon the many instances recorded of its influence. We have but to call to mind the extraordinary effect of the Jacobite airs, so associated with the cause in which they had been such powerful agents, that even still they make the blood to tingle and the heart to throb; and that enthusiasm which flew like the electric spark through every rank whenever the Marseilloise hymn was heard—a whole audience rising simultaneously, and, amidst the waving of handkerchiefs and gestures of devotion, joining heart and voice in the national anthem—or, whenever it was struck up by the military bands, regiments of soldiers dropping on their knees, as it were solemnly devoting themselves to the cause in which they were engaged. Who has not heard of the effect of the Ranz des Vaches, so dear to every Swiss? It is so great, that the commanders of those regiments who served abroad were often obliged to forbid its being played, under the severest penalties: the poor soldiers, when they heard it, would melt into tears; many deserted, while others fell sick, and some would pine away, and die of the *maladie du pais*. This simple wild air was so associated with their native valleys, and their mountains, and their rocks, and all the sweet echoes of home, and the affections that had hallowed it, that an irresistible impulse to return would seize them, and tempt them, in defiance of danger, to desert their ranks, or would sap the very springs of life, and send them broken-hearted to the grave.

In all the variety of associations, there is nothing more remarkable than the deep hold which objects, in themselves utterly insignificant, take of the affections. I know a widow lady, whose only child fell sick of a fever; her case was pronounced by the physicians to be hopeless, and her death was every moment expected. The disconsolate mother watched by her bedside in an agony of grief, and she felt her heart die within her as she saw the child picking at the bedclothes, which is considered a most fatal symptom; but what was her surprise when she saw the little creature, who had seemed in a state of stupefaction for hours, raise her hand, and display between her finger and thumb a small feather, which had worked through the pillow, and heard her say, 'Mamma, look at the pretty feather!' The poor mother's heart bounded with hope and thankfulness: from that moment the complaint took a favourable turn, and the little invalid recovered. Among all the relics of former days, nothing was more fondly treasured than that little feather. Years and years have rolled away since it was first consigned to her pocket-book; but who could number the times when it has been taken out, and gazed on with delight! To this day the tears of gratitude and affection are often shed over it.

Doctor H—— was devoted to scientific and literary pursuits, but in his hours of relaxation he used to amuse himself with his little grandchild, on whom he doted. He would often carry her in his arms to look out of his study window; the favourite would run her tiny fingers along the panes of glass, which bore the traces long after the little creature fell sick and died. The grandfather was often observed to saunter to the window, and stand there in a deep reverie. One morning, on entering the room, he found the servant had gained admittance before him, and discovered him busily engaged in cleaning the window. The marks of the little fingers were gone. A violent burst of agonized feeling showed plainly how fondly they had been associated with the memory of the dear child in the heart of the poor old man.

Perhaps the most extraordinary effect of association may be that in which blemishes are made to hold the place of charms; and what is positively unpleasant, becomes, by its magical influence, agreeable. I have known people like a lisp or a stoop, because some whom they had admired had happened to stoop or lisp. Descartes mentions that he had all his life a partiality for persons who squinted, from having, when a boy, been fond of a girl who had this defect. I remember a little boy who preferred the odour of rancid oil to any perfume, from the simple reason of its having happened to be made use of in the exhibition of a magic lantern, in which he took extreme delight.

The associations which attach to particular places, or to articles of furniture, which seem to be apart from any fond recollection, are mysteries in our nature for which it would be difficult to account. Locke tells us of a young man who danced extremely well in the room with a certain trunk, but could not dance at all in one where it was not. I have heard of a gentleman, remarkable for his convivial talents, who lost all power of entertaining if placed in a different seat at table from his usual one. Guests were invited on one occasion, that they might be gratified by his sallies of pleasantry; but unfortunately his chair was occupied by another, and he remained silent and reserved, to the disappointment of the company.

Certain tricks are strangely associated with the powers of memory and mental exertion. In the Tatler, it is told that a lawyer was in the habit of twisting a piece of pack-thread round his finger while pleading, which was aptly called by some one the thread of his discourse. A client of his stole it from him, to see how he would get on without it: he was punished for his rash experiment—the lawyer hesitated—could not go on—and the cause was lost. Haydn wore a ring which had been presented to him by Frederick II., but if he accidentally forgot to put it on, it is said that the gifted musician lost all his inspiration, and that, if seated at the instrument, he could not summon a single original idea. I am acquainted with a barrister remarkable for

oratorical powers of the highest order, who finds it absolutely indispensable that he should wield an open penknife in his hand all the time he speaks, which he holds behind his back, and twirls with a rapidity and dexterity which could not be imitated without the risk of severe injury. There is scarcely any one who cannot call to mind in some friend or acquaintance an instance of this strange vagary of the mind. Among many which press upon my recollection, I will satisfy myself with mentioning the curious case of Blind Alick of Stirling, with which, indeed, many are probably familiar. His memory was truly astonishing: in his childhood he had attended a school where the only class-book read was the Bible: from the sad privation of sight, it might naturally have been concluded that poor Alick was incapable of reaping the same benefit from instruction which his schoolfellows did: as the scholars read in rotation, it was customary for them not only to repeat the number of the chapter, but also that of each verse. After poor Alick grew up, he was obliged to support himself by begging through the streets, as he had lost his parents, and his misfortune deprived him of the power of working for his bread. The extent of his memory was such, that he was looked on as a wonder: he had the whole of the Old and New Testament off by heart: if a verse were repeated to him, he could tell its number, and in what chapter it was to be found; if the number of a particular verse in a certain chapter were named, he could repeat it without a moment's hesitation; if he heard a sermon or a speech, he could go over it with an accuracy that surprised every one. It was at length observed that Alick, on leaving home every morning, locked the door and carried the key in his hand, which he kept constantly rubbing up and down as he replied to the questions put to him. One day it was stolen from him: the effect of the experiment was, that he hesitated, became confused, and his memory failed him altogether.

VISIT TO SOUTH-WESTERN AFRICA.

In the spring of 1841, Mr Dos Santos, the Portuguese consul-general in Altona, fitted out a commercial expedition, consisting of six vessels, laden with European goods of all kinds, which he proposed to conduct in person to the coast of Angola, for the purpose of carrying on a trade by barter. He was led to this enterprise by the successful result of a minor speculation which he had some years before committed to the charge of a supercargo—very naturally concluding that a larger affair under his own immediate superintendence would be attended with proportionate returns. The expedition, though simply that of a merchant, was equipped with princely munificence; everything that could conduce to the comfort of so long a voyage being provided on board of all the vessels. A well-selected library, a band of musicians, two naturalists, and a physician, completed the equipment of the flotilla, which cleared the bar of the Elbe on the 30th of June 1841. Unfortunately, many of those who that morning left their native river, looking hopefully to the future, were destined never to return—Mr Dos Santos, the two naturalists, and many of the crews, having at an early stage of the enterprise fallen victims to the inhospitable climate of Africa. This untoward event so embarrassed the future procedure of the expedition, and damped the ardour of the survivors, that, leaving their task unfinished, they hastily left the coast, and returned to Europe. The physician, Dr Tams, has since published a narrative of the transactions;* and to this, as affording glimpses of a region very little known, we would now direct attention.

After a voyage of ordinary weather, the flotilla, on the 10th of October, descried for the first time the painfully interesting coast of Africa; the vast district of Benguela, not the least interesting portion of that coast, lay before them. 'We were a little to the south of the town of Benguela, and had every reason to hope that we should reach it the same day. The sea along that coast is everywhere so deep, that the largest vessels may approach within a mile or two; and we were soon able clearly to distinguish the shore, with all its diversities of hill and dale, covered with trees and shrubs. The mountain-slopes, which run down close to the sea, were covered to the very summit with the most lovely verdure, and the intervening valleys were clad in smiling green. Here the graceful palm rears its lofty head above the umbrageous thickets; there those giants of the vegetable world, the mighty adansonia, and the grotesque cacti, tower proudly above the numerous dwarf plants at their feet. Wherever the eye turned, it rested on a luxuriance and beauty which formed a surprising contrast with my preconceived notions of Central Africa, which I had involuntarily associated with images of vast deserts and arid plains, and a vegetation parched and shrivelled by the scorching rays of the tropical sun. It is melancholy, indeed, that this beautiful coast is so scantily inhabited; but alas! its very advantages offer such facilities to the slave-hunters, that the persecuted children of the soil only traverse these lovely solitudes when commercial interests bring them from the interior to the coast. Instead of the smiling cot, the cultured plain, and a free and happy people, the lion, the panther, the elephant, and the hyena, troops of antelopes, zebras, and buffaloes, house in these vast districts.'

The region here referred to is that in which is situated the Portuguese presidios of Benguela, Novo Redondo, Loanda, and the free town of Ambriz—a region which has been, for more than two centuries, in the possession of Portugal, and which at this moment is more degraded, morally and physically, than before the missionaries of her church set foot upon the soil. The slave-trade, as we shall shortly see from Dr Tams's relation, is the curse that hangs over the land; a traffic to which agriculture, commerce, and every other consideration, indeed, is subordinate. It requires labour, and skill, and patience, to make wealth by ordinary commerce; hence this is abandoned for the speedier method of trading in human lives. Nor is the slave-trade of the present day the same as that which existed half a century ago. Then, the custom of every European nation rendered it somewhat *respectable* — noblemen, princes, and even ecclesiastics, did business in the slave mart; now, none but the scum of society would pollute their hands with such iniquity. The consequence is, that the Portuguese settlements in Lower Guinea are rapidly retrograding: harbours and forts are falling into decay; churches are priestless, and in ruins; and public works, commenced by the Jesuits of other times, are now densely matted with the vegetation of a tropical soil. To return, however, to Dr Tams's descriptions.

The harbour of Benguela, into which the vessels had now steered, is described as one of the best on the west coast of Africa; and the town, especially when viewed from the sea, presents a very pleasing appearance. 'It is situated in a charming valley, partially enclosed by the lower range of the lofty mountain-chain which rises from the coast. Numerous isolated roofs sparkle in the sun amid the rich vegetation, and produce the effect of neat country-houses, environed by flourishing gardens. The river Catumbella imparts to this mountain-valley such a high degree of fertility, that the manifold

* Visit to the Portuguese Possessions in South-Western Africa. By G. Tams, M.D. Translated from the German, with an Introduction and Annotations, by H. Evans Lloyd, Esq. London: Newby. 1846.

variety of its luxuriant vegetation far exceeds all that the fancy of a European stranger can conceive. Tall cocoa-palms conceal the greater part of the town, and the eye perceives at first only the decayed walls of the fortifications, the government buildings, and a very few private houses. We cast anchor at a due distance from the coast; and a European custom-house officer, in a shabby uniform, immediately put off from the shore. He was rowed by four negroes, who were almost naked; and after coming on board, and paying us a short visit of inspection, he gave us permission to land as soon as we pleased.'

Having been carried from their boats on the backs of sturdy negroes, the party hastened to pay their respects to the governor, and were conducted to his *palace* by an escort consisting of a single native. And now for a peep at this representative of royalty, and his residence. 'The government palace is so excessively mean, both within and without, that it seems better adapted to shelter horses or cattle, than serve as the residence of the representative of a crowned head. My sensations on entering it were not unlike those which are experienced on going into the dungeon of an ancient knight's castle. An involuntary shudder came over me, and I looked around in perfect astonishment. The walls were very thick, and bore traces of having been once plastered, but were now dingy and defaced; the floor consisted of the bare earth; and the doors were so wretchedly hung, that they would only half close, or not at all; everything was disgustingly dirty; while the furniture, which was partly old-fashioned and partly modern, looked as if it had been collected at auctions from every quarter of the globe. We were duly announced by the orderly, and immediately admitted to an audience. The governor, who had formerly served in the Portuguese army, had been sent to this country for some misdemeanour, and was still separated from his wife and children, who lived in Loanda. His residence in Benguela, especially in the official situation which he held, afforded him more favourable opportunities for speedily acquiring great wealth than any other place on the coast of Angola; and he was not slow in availing himself of every advantage.'

The town which can boast of such a governor and such a palace, cannot be expected to present many attractions; and yet here it is, from the pencil of Dr Tams—not quite so forbidding as one would anticipate. 'The streets are straight, regular, and broad, but contain more ruined than inhabited houses. About five or six years since, a savage tribe, probably the Giagas, made an irruption into the town, which they plundered and destroyed, and having cruelly massacred all that came in their way, retreated with considerable booty. The town has a very pleasing and romantic appearance; some of the houses are very pretty, and though built only of clay and palm-branches, have nevertheless something of a European air. At the extremity of the town are many conical bee-hive shaped negro-huts, likewise composed of palm-leaves and rushes. Many a swart negro half-raised himself from the sand, and modest matrons and smiling damsels came to the cabin door, while curly-headed little urchins peeped slyly from among the bushes, to see the white stranger as he passed along.

'The dwellings of the Europeans always have two or three courtyards attached to them; these are surrounded by walls about ten feet high; and here the domestic slaves are kept. Several streets are formed by these unsightly walls running up on either side; and as the fronts of the houses face the other way, these back streets have of course a very dull appearance. Those, on the contrary, which are exclusively inhabited by negroes, are rendered both interesting and entertaining, partly by their social mode of living out of doors, and partly by the variety of goods and stores which they offer for sale.

'In the centre of the town are two large regular squares, but which have a very gloomy and desolate appearance, being surrounded by the walls of the courtyards, and a few European houses. Here there was a total want of animation, broken only by the clanking chains of the government slaves, the word of command, and the monotonous reverberation of their implements of labour. They were, for the most part, fastened five or six together, and were standing here and there with hoes in their hands to destroy the rank and noxious weeds, while a soldier, armed with a sabre, superintended them at their work.'

The population of Benguela is about 3000, one-third of whom consists of mulattoes and whites; the latter rarely exceeding 300. To these three or four hundred Europeans, the place, in its present condition, can present no attraction; it is the idea of making a fortune in a few years by the slave-trade that animates their existence. The climate is so excessively hot, that they can only move abroad for a short time during early morning; they cannot hunt or fish, for the surrounding country is a jungle, peopled with lions, hyenas, serpents, and crocodiles; they can enjoy nothing like civilised society, for their companions are heartless villains, like themselves, whose hearts are seared with the atrocities of the slave-trade. Their only pleasures—if the idea is permitted to be so degraded—are a bloated licentiousness, and the business of the slave-yard. 'These yards are generally about sixty feet square, and frequently contain from one hundred and fifty to two hundred negroes. In the midst of this mass of human beings, it is very common to find swine and goats. For their protection, little sheds have been erected; while man is wantonly exposed by his fellow-man to the powerful influence of the dew, the rain, and the sun—

> "No cloud in heaven to slake its ray,
> On earth no sheltering bower."

With heartless indifference, the Portuguese slave-merchant conducts the stranger into these courtyards—the warehouse where he keeps his human merchandise; but while the sight of this heart-sickening scene harrows up every generous feeling, it inspires him with no sensation but that of fiendish joy at the possession of so much wealth, just as the sordid miser gloats with delight over his accumulated hoards.'

Happily for the good fame of Europe, all the slave-dealers in Benguela are Portuguese, with the exception of two or three Italians; unhappily for Africa, their iniquitous trade is so flourishing, that in 1838 nearly 20,000 slaves were exported from Benguela alone; and within the last few years the number is rather on the increase, in spite of the vigilance of the British cruisers. Leaving, therefore, Benguela, which presents not a single civilised attraction—for Dr Tams could not find either a tailor, carpenter, smith, or mechanic within its environs—and passing by the smaller settlements of Novo Redondo and Mossamedes, let us look at Loanda, the chief of the Portuguese presidios.

When viewed from the sea, Loanda presents a very striking appearance. 'It is built in the form of an amphitheatre, rising from the base to the very summit of the mountainous terrace of the coast, which here comes down nearly to the water's edge. The general character of this prospect is said to bear some resemblance to that of Bahia, in the Brazils. The numerous houses built in the European style, many of which are very large, and roofed with red or blue tiles, the neatly-painted white or yellow walls, the pretty towers of the churches and of the hospital, the palace of the governor, situated at the highest part of the town, and the neighbouring fort, with its impenetrable walls, constructed of bricks and granite, greatly excite the surprise of the stranger, who fancies that he has before him a strongly-fortified town.

'Loanda is defended on the sea-side by three strong forts; but on the land-side it is quite exposed, being wholly unfortified. The harbour is deep and commodious, and being three and a half miles in length, will conveniently contain several hundred ships. It is

formed by an island which runs parallel with the coast, and in some measure protects it against the west winds; but as it rises only a few feet above the level of the sea, a high westerly gale often proves dangerous to the ships at anchor, and some of them are not unfrequently driven from their moorings. There are seldom many vessels in the harbour at a time. During the whole of our stay, I never saw more than twelve, five of which belonged to our own expedition. They seldom lie long at anchor, because here, as in Benguela, the exportation of slaves constitutes by far the greater part of the trade; and the vessels employed in this nefarious service are, of course, despatched by their owners resident in the town as speedily as possible.'

Loanda, though exhibiting little of the structural magnificence which characterised it about a century ago, is still a place of some note, and seems to have made a very favourable impression on our author. 'When I was in Benguela, I often heard mention of the splendid buildings of Loanda; but as all the houses in that town are very mean, I formed no great expectations of this city. I soon perceived, however that I had been incorrect in my surmises; for instead of the wretched hovels which I had of late been accustomed to, I found almost all the houses in Loanda built of brick, and roofed with red or blue tiles. They are generally two storeys high, have no chimneys, and the exterior is painted white or yellow, which gives them a very fresh appearance. The courtyard, instead of being walled in, is surrounded by a high fence, and contains several small negro tents, and the kitchen belonging to the dwelling-house. Only the palace, and a few other government buildings, are furnished with glass windows; for the equable temperature of the climate renders them superfluous, and the shutters afford adequate protection against the sun and draughts of air.'

There are no lodging-houses in Loanda; and, being anxious to reside on shore during the stay of the flotilla, Dr Tams was indebted for such a privilege to the hospitality of the chief and only physician of the place. A glance at the interior of his host's house may interest our fair readers, but will not make them envious, we trust, of so much queenly ease and dignity. 'On entering the house of the physician, several young negresses were at hand to open the doors for us, and we ascended a fine stone staircase, which led from the spacious hall to the upper storey. We passed the study, which resembled a saloon in size, and then going through folding-doors, entered the large drawing-room, where the lady was reclining at the window in a Brazilian rocking-chair, and three or four young female slaves were seated on the ground near her, employed in needlework. The elegance of the apartment, the walls and floor of which were handsomely painted, the costly furniture, and the tasteful attire of the lady, gave an agreeable air of comfort and wealth to the whole. Two little slaves were sitting in a corner with a couple of pretty monkeys, which they held by a ribbon, waiting for a signal from their mistress to bring forward her little pets, with which she frequently played.

'The lady courteously rose to receive us, and extended her pretty hand for us to kiss. She was a native of Spain, and although she had resided here six years, the heat of the climate had been unable to extinguish the fire of her fine dark eyes. Her raven hair hung in two thick tresses over her shoulders, and when she smiled, she displayed a magnificent set of pearly teeth. The contour of her limbs had not, as is usually the case, suffered from the effects of the torrid zone, and her clear olive complexion, slightly tinged by the beams of the sun, was extremely interesting and expressive. Her little sempstresses were immediately dismissed to fetch water and Hollands, which proved highly acceptable after our morning's ramble.'

Under such a roof, and with such a hostess to do the duties of hospitality, one might consider Dr Tams a very fortunate man; and this he was, if spacious apartments, abundance of black servants, a well-ordered table, and other creature-comforts, could make him so; but the Donna Catarina was a bit of a tyrant, and the chastisement of her slaves was ever grating on the feelings of her guest. 'I had scarcely been in possession of my new lodgings for an hour, and was occupied in arranging my effects, when my attention was suddenly attracted by the sound of stripes, repeated at regular intervals. I soon perceived that some person was undergoing corporal chastisement in the courtyard, and at once hastened to the lady of the house. I found her sitting as usual at the open window, enjoying the cool sea-breeze and the fine prospect of the harbour, while a young negress was busily engaged in needlework at her side. To my anxious inquiry respecting the loud beating which still continued, she replied smiling, that one of her needlewomen was receiving, by her orders, six dozen palmetadas (blows on the palm of the hand), because her stitches were badly made. My indignation and disgust being excited in the highest degree, Donna Catarina was induced to send the other girl to the courtyard, with orders that the punishment should be discontinued.

'She was so civil as to send immediately for the instrument with which the chastisement had been administered, assuring me at the same time that this punishment scarcely gave any pain, and was imposed by her only upon the youngest slaves, and for the most trivial fault! The instrument consisted of a piece of Guaja wood, nearly two feet in length; at one end of the round handle was a flat circle, about the size of a hand, perforated with holes, to deaden the sound while used in inflicting punishment. In spite of her assertions to the contrary, I had subsequently frequent opportunities of seeing the hands of the poor slaves much swollen and lacerated, nay, bleeding from the effects of this punishment, which is practised along the whole coast of Angola. To add to her cruelty, my hostess compelled the sufferers at once to return to their work. During my residence of seven weeks in her house, not a single day passed in which this stern Spanish woman did not cause this punishment to be inflicted several times; and the abhorrence which I repeatedly expressed, produced no other effect than that it was generally carried into execution during my absence.'

The daily routine of our author's life while resident in Loanda presented, on the whole, but little variety. There were no public places of amusement; and no excursions were made into the interior, for dread of catching fever, or being caught by wild animals. There was a dance, to be sure, given every Sunday evening by the governor, to which all the principal inhabitants were invited; and this, with an occasional crocodile hunt during the wet season, constituted the sum-total of their sports and amusement. There was no riding or caracoling, such as the British have in India; for there were only three or four horses in the town. Each family seemed wrapped up in itself, intent only on slaves, and barter, and money: to make their fortune, and be out of the country with all convenient speed, was the universal maxim.

'We rose,' says Dr Tams, 'about five o'clock in the morning, when the physician immediately went out and visited his patients; his wife inspected and directed her household; and I watched from the window the numerous caravans which generally arrived early in the morning, and which consisted of different tribes, distinguished by their various costumes and weapons. At eight o'clock we all assembled at breakfast, which generally consisted of baked calves' feet, the unripe pods of Cayenne pepper seethed in bouillon, or of boiled snails—some species of *purpura*. Strong wines, which are rendered necessary by the extreme heat, are indulged in without restraint: red Lisbon is first taken, and the glasses are constantly replenished by a little slave. Donna Catarina partook almost as freely as we did, and I could not help feeling surprised at the large quantity which the hot climate enabled even delicate women to take without any visible effects being produced. Imme-

diately after the substantial part of the meal, tea was handed round; but here, as elsewhere, it was served without milk, which, on the whole Portuguese coast, is considered poisonous, or at least dangerous. The pet monkey, which had been playing in the arms of his female attendant behind our chairs during breakfast, was then placed upon the table, to pick up the scattered crumbs, and play his antics for our diversion.

'After breakfast, we entered upon no active occupation, except perhaps some trifling business about the house. We looked through the telescope at the sea, or watched the flag hoisted on the fortification of San Miguel for the signal of a ship approaching the harbour; or our hostess amused herself with the chastisement of her slaves, who, as a matter of course, had invariably committed some fault; after this, each retired to rest, and did not rise again till noon; but I always occupied myself with visiting the several ships, which, however, were in a very healthy state.

'About twelve o'clock we again met at luncheon, which was comprised of English cheese and porter, and then lay down to sleep till four o'clock, when we commenced the real business of the day with a substantial dinner.

'Our house being celebrated for the excellent table kept by our host, we were seldom without visitors at this time; but although they gave some variety to the daily uniformity, I must confess that, from the circumscribed interest of each person, and the general want of education, our conversation could very seldom be termed instructive. The repast began by the hostess repeating the names of her guests at full length, and drinking their health, a courtesy which was of course responded to by all; and then followed a string of unmeaning speeches and flatteries, until the stock of compliments, in which the Portuguese language is so rich, was completely exhausted.

'This ceremony over, the cook was generally summoned, and informed whether his art had gained him praise or punishment; the latter of which, at all events, was never withheld. If the physician wished to sell any slaves, they were ordered in, and he selected this time for bargaining for them. Praise or blame was bestowed without reserve, while the poor wretch was passively awaiting the decision of his fate from the cold-blooded dealers, of whom it might with truth be said, that in their breasts beat

> "Hearts dead to sympathy, alive to gain,
> Hard from impunity, with avarice cold,
> Sordid as earth, insensible as gold."

'The dessert always consisted of an ample selection of the finest fruits, especially cachew-nuts, oranges, and mangoes. A cup of indigenous coffee having been presented to each person after dinner, the company generally took advantage of the refreshing coolness of the evening to enjoy a short walk; after which, till one o'clock in the morning, the time was consumed in playing at cards!

'To the very last moment three or four of the youngest slaves sat on the ground in the adjoining apartment, waiting in case they should be summoned, and ever on the watch to pick up anything that might fall upon the floor. If the unhappy little things, from four to eight years of age, were unable to resist the influence of sleep, the application of the universal remedy was not delayed for a moment; and the last sound which was daily heard in that house was the wail of these poor young children, each of whom was indeed

> "A child of tears,
> Cradled in care and wo."'

Such is European life in the Portuguese settlements of Angola—a district abounding in almost every natural production, and which might, under judicious management, be made one of the finest fields for commercial enterprise. The natives, according to Dr Tams, are not the inferior race we generally regard them: they are naturally disposed to trade and barter; their country is rich in ivory, oil, wax, honey, fruits, spices, cotton, coffee, sugar-cane, metals, and minerals. But agriculture and commerce cannot flourish in conjunction with slavery; and we need not look for the development of these resources till the curse of the slave-trade be removed from the land.

FIRESIDE CHIT-CHAT.

NO IV.

Gilaroo.—You seem in a bad humour: nothing unpleasant, I hope?

Stukely.—No great matter certainly; still one doesn't like to be cheated. A cabman has charged nearly double his fare, and rather than make a noise, I have paid his demand. These cabmen are the greatest rascals in existence. All a set of drunkards and extortioners. There is no satisfying them.

Gil.—As a class they have their failings, I admit; there are, however, decent men amongst them. Did you ever consider what can be the cause of their being what you would call a bad set?

Stuke.—There may be a dozen causes for anything I know. Nobody can tell much about cabmen—where they were born, or how they live. I never can bring myself to believe that they have houses to go home to at night; or that they take off their clothes and go to bed; and eat breakfasts and dinners; and pay tailors' bills; and fulfil all the other duties of Christians. They seem to me to live in their harness, like their poor hacks, and never quit the reins but to empty so many pints of porter. Porter is their meat and drink—bed, board, and washing. Each man of them is but an incarnation of Barclay and Perkins's entire, or Meux's double stout.

Gil.—That is really too bad. I must not permit you to run down the whole corps in this way. Why cabmen are unsteady, improvident, and not particularly conscientious, is imputed by many to a love of drink, which renders them poor and necessitous. But you may remember, in one of our conversations, that I mentioned intemperance as being only a secondary cause of bad behaviour. There is a cause beyond—something which causes the intemperance; and I believe that any remedy which stops short of this primary prompting cause will be likely to fail. One of the causes of so much intemperance and laxness of conduct among cabmen is irregularity of employment, with irregularity of payment. One day they will make a pound, and the next day perhaps only eighteenpence. For hours they will lounge about doing nothing, and then for hours they will be employed without intermission. You see this is a very scrambling, hap-hazard mode of existence; and it would require a far higher order of mind than these men possess to withstand the temptations to which they are exposed, or to act with consistent prudence and conscientiousness. The poor men are, in fact, to be pitied. Exposed to all weathers—the rain pelting mercilessly upon them—cold, wet, weary, sleepy, and hungry—only a few minutes probably to take any refreshment: with all this, can we wonder that they fly to beer and spirits for exhilaration, and become habitual tipplers? I for one don't think so.

Stuke.—I fancy this is what you call going back to first principles? But it's a downright apology for drunkenness and dishonesty, whatever you call it.

Gil.—Only viewing things charitably, along with a little reflection; that is the whole of it. I will mention a case pretty much in point, which I heard talked of the other day. A gentleman entertaining humane and considerate views, was some years ago appointed superintendent of a large manufactory in England. In this establishment he soon had occasion to observe that a certain number of the workmen were regular in attendance, steady, and economical; while the others were of contrary habits, unsteady, uneconomical, great

drinkers, and with families in wretchedness. This had been the case for a long course of years, and nobody about the works thought of inquiring into the cause of the phenomenon. The new superintendent was not one of those persons who never inquire into anything, and let the world go on in its own old way. As soon as he observed the curious difference I mention, he did not rest till he had discovered the cause of it. On inquiry, he found that all the steady men got a fixed or regular weekly wage, and that all the unsteady ones, though receiving a larger revenue in the aggregate, got it in lumps at irregular intervals, just as they happened to be employed on a particular kind of work. To know the cause of the evil, was to set about eradicating it. With the consent of the unsteady hands, he began the practice of paying them every week a certain fixed sum, whether they had earned it or not, carrying forward the balance, if any, to their credit; the accumulated balances to be paid quarterly. The effect of this arrangement, it is said, was marvellous. Very soon the unsteady became as steady as the other members of the establishment. Their wives and families were better dressed; their homes became comfortable; and by and by several of these men saved so much money as to be able to buy houses—actually became proprietors, and drew rents like other landlords. Nor were they ungrateful to the person who had thus put them in the way of well-doing. They looked upon him as a general benefactor. A few years ago, when visiting the place, and calling on one of the parties, both husband and wife looked round their cheerful dwelling, and said to him, '*All this we owe to you.*'

Stuke.—What has all this to do with cabmen?

Gil.—You surely see that the good behaviour of these reclaimed workmen was owing to a change from greatly irregular to regular wages? Irregularity of payment for labour is one of the greatest social evils. All classes, high and low, who are exposed to it, feel its demoralising effects. Actors, musicians, painters, authors by profession—all who cannot reckon on something like a regular income, are unhappily situated, and exposed to many temptations and misfortunes. Their life is a sort of gambling—sometimes a run of luck, sometimes nothing.

Stuke.—Well, but you are talking of what often cannot be helped. Who's to pay cabmen twenty shillings a-week, dead certain, and take the risk of the balances? I'll tell you what it is; this kindness-system may do with some, but not with all. I don't believe anything would do for cabmen but being pulled up by his worship the police magistrate.

Gil.—I by no means undervalue the efficacy of magisterial interference. I only wish that the authorities who have to do with cabs and hackney-coaches would proceed a little more considerately. The cabmen in Paris and some other continental towns are under such strict regulations, that they have not the same power of cheating as their brethren in London. But, unhappily, it is not the practice in Great Britain to take a lesson from foreign usages. A good plan may be working for a century in Paris before an Englishman would copy it. It is only by sheer experience, and all kinds of wrangling, that anything is ever put to rights in this country, although the knowledge of something better may be propagated in the works of a hundred travellers.

Stuke.—I cannot say as to that; my principle of government is severity—severe chastisement for all varieties of evil-doers.

Gil.—Of course you believe what you say to be right; but can you prove it?

Stuke.—What kind of proof would you have? Has it not been the practice, since the beginning of the world, to punish every crime according to its deserts? Hang this one, imprison that one, and so on. There is Scriptural authority for it all. 'He that spareth the rod,' &c. Where could we find anything stronger than that?

Gil.—I am not going into any argument about the antiquity of severe punishments. I give that up with all my heart. What I want is the proof that the severe is the right way of going to work—the plan most expedient. It will not do to tell me, for example, that hanging is right because it is of great antiquity. I must have evidence that it is just in principle, and the most expedient as respects the prevention of crime.

Stuke.—All the evidence I can give you is, that, by our present system of punishments, crime is powerfully kept in check. Were it not for fear of the gallows, there would be no safety for life or property. Everybody knows that.

Gil.—That is only mere assertion. I ask you for a proof of a fact, and you answer by telling me that there is something which everybody knows. With all deference, that is no reasoning at all. If you had said, I can produce a hundred persons who declare they would commit crime were it not for fear of being hanged, that would be a piece of evidence; and I would be inclined to say that there was much force in your argument.

Stuke.—One must take a good many things on trust. I have always thought, and I believe so do most persons, that executions have a very salutary effect; very much so indeed.

Gil.—You then, in reality, confess to a prejudice—make up your mind to believe in a thing without previously looking into evidence; which, however, does not surprise me, for not one man in fifty ever examines into the truth of anything. And so people go on taking things for granted, generation after generation.

Stuke.—But how am I to examine into these affairs? I cannot be expected to spend a lifetime in hunting up statistics, or hearing the confessions of felons. I must act on general impressions; and what more likely, than that the fear of punishment is a powerful preventive of crime?

Gil.—Likely enough so far, but not to the extent you suppose. At one time a great many crimes were punishable with death. Humanity at length revolted against this severity. Punishments of a milder nature were substituted; and, to the surprise of many individuals, the crimes so treated did not increase—they decreased. As long as forgery was punishable with death, forgery was common; ever since it has been punished with imprisonment or transportation, it has been very little heard of. It used to be said, 'This is a commercial country, and unless we hang all and sundry who are found guilty of forgery, there will be a terrible state of things.' Such was the sort of argument employed during the last century, when kings would remit the punishment of highwaymen, but never that of forgers. And behold! we have lived to discover that they were all in a mistake.

Stuke.—Still, I should think that capital punishments must have a good effect in the way of warning?

Gil.—This is now also very much doubted. It is believed that the spectacle of executions has, on the whole, a demoralising effect. It satisfies only mean and despicable feelings; never intimidates from crime, nor stimulates to virtue. So little is its value as an example, that robberies are common in the crowd collected at executions: pockets are picked beneath the gallows. If capital punishments are to continue, I should certainly prefer that they took place within the courtyards of prisons, in presence of the authorities, instead of the open street. The public should not be accustomed to see a dog strangled, let alone a human being.

Stuke.—Supposing we got rid of capital punishments, would you propose to immure criminals in dungeons for life, or at least for a term of years?

Gil.—It would not be difficult, I daresay, to devise some efficient, yet humane kind of imprisonment; and I think we are at present advancing towards correct views on this important question. In few things, indeed, has society advanced so far. Among other notions of our ancestors, there was a belief that if the prisons were rendered very miserable, they would terrify the populace into good conduct. An old act of parliament, providing for the sustenance of felons, begins with the

words—'Whereas many prisoners, having no means of subsistence, have died of hunger;' from which we learn that death from starvation was not uncommon in former times. It was also an admitted principle, that prisons should be kept dirty and uncomfortable, the more to terrify evil-doers: in Scotland, this quality in jails was recognised in jurisprudence as the *squalor carceris*. All this oppression, however, did no good. The prisons were always full, notwithstanding their dirtiness and the privations they inflicted. It was only taking a mean revenge on the unfortunate.

Stuke.—You talk of criminals under the term *unfortunate*. That, I think, is a loose, though not an uncommon way of speaking of felons. I want to know what makes these men unfortunate—their own evil passions to be sure. It is their own blame being criminals. They set aside all advice that is given to them; persist in going on to destruction: and yet they are called unfortunate, as if their being criminals had arisen from an accident over which they possessed no control.

Gil.—You do not seem to be aware that crime often proceeds from dispositions which may be considered as the result of something in the mind equivalent to malformation or disease; often, again, it results from the merely casual misdirection of a mind left free of proper guidance, or exposed to unusual temptations. The great bulk of crimes, especially those against property, take place in early youth, and amongst the ignorant and miserable classes. Generally speaking, such a culprit can scarcely be held responsible as a free agent. Crime and its consequences are his social destiny. He may have been told that he incurs the risk of punishment; but he either acts under an incontrollable impulse, or has not been enabled to see the just relation between offence and its penalty.

Stuke.—That is making out criminals to be little better than idiots; whereas they are the sharpest people in existence.

Gil.—Sharp in those faculties which they employ in committing crime, but dull, if not defective, in others. A man may be a clever pickpocket, and yet a monstrous blockhead—so sharp in overreaching, that he overreaches himself. Take the mass of criminals, and they will be found to be the victims of some wrong impulse in youth. For this they were punished in some vengeful kind of way: turned out of prison with a bad character, nobody would employ them: again they committed a crime for the sake of subsistence: and so on they went, society all the time calling them blackguards—never pitying or trying to reclaim them: at length they are huddled out of the way, if not to the gallows, at least to Van Diemen's Land. And thus is Britain emptying her prisons on one of the finest islands of the Australasian seas—rendering it a land of crime, wretchedness, and horror, from which all good men will fly as from a pestilence. The whole system is carried on in violation of reason.

Stuke.—Perhaps so; but reason, in the abstract, is often not workable with advantage in human affairs. Mankind have many foolish notions. You allow that criminals have not self-command—are a kind of half lunatics? Should we not, then, meet this state of things with reproof or punishment suitable to visionaries? Although a humiliating confession, I must say I do not entertain a high opinion of human reason. You know what D'Israeli has said on the subject?

Gil.—No.

Stuke.—I shall read the passage from one of his late works. 'We are not indebted to the reason of man for any of the great achievements which are the landmarks of human action and human progress. It was not reason that besieged Troy; it was not reason that sent forth the Saracen from the desert to conquer the world; that inspired the Crusades; that instituted the monastic orders: it was not reason that produced the Jesuits; above all, it was not reason that created the French Revolution. Man is only truly great when he acts from the passions; never irresistible but when he appeals to the imagination. Even Mormon counts more votaries than Bentham.' That is what he says; and is it not true? He might have added, it is not reason that makes hundreds of millions of men worshippers of Budh, or believers in Mahomet; nor is it reason that guides our own countrymen in the greater number of their actions: it is their passions, their imagination, their avarice.

Gil.—All vastly fine; one of D'Israeli's specious pieces of clap-trap, which wont stand handling. It is undeniable that the passions have caused great social movements; but I protest against the inference, that reason is on that account weak or valueless. In all advanced conditions of society, reason has been and is the guiding principle. It was reason that discovered the compass, the quadrant, and the telescope—instruments which have made us acquainted with the surface of our own planet, and disclosed to our wondering eyes worlds in the firmament. It was reason that discovered the art of printing, which has already performed marvels, but is still only in its infancy. What has promoted the cultivation of science—what has given us the steam-engine, the locomotive, and the whole of our magnificent machinery? Reason has done it all: and is not reason, in union with the best feelings of our nature, the source of all our truest happiness? It is no doubt lamentable that truth should make its way so slowly as to be outstripped by visionary fanaticism—that Mormon should count more votaries than any philosopher amongst us. But while the dream of the visionary subsides, truth strengthens. Seventy years ago, a gentleman, living obscurely in the small town of Kirkcaldy, on the northern shore of the Firth of Forth, propounded an idea. Nobody at first cared for it, or believed it. The world was thinking about something else. But the idea was founded in truth, and a truth uttered in the ear of the world is imperishable. Now advancing, now pushed back, then advancing again, this truth has finally, after a struggle of seventy years, made its way into the halls of princes, and rings in the assemblies of legislators. What a triumph for the once disregarded and often discouraged idea of the obscure gentleman in his little parlour overlooking the sands of Kirkcaldy!

Stuke.—Why—what—what is the idea you allude to? Who was the obscure gentleman?

Gil.—The obscure gentleman was Adam Smith. The idea was the principle of Free Trade.—Good-night.

SCENE IN A RUSSIAN GARRISON.

On the 22d of May 1841, one of the battalions composing part of the military colony recently established by the Russian government at Novgorod, and which, in the singularity of its organisation, resembles the Prussian landwehr, was drawn up in line on the parade-ground attached to the immense barracks constructed a few years since on the most solitary and ancient part of the town, not far from the church of Saint Sophia. In front of the line, formed with that mechanical regularity and precision which have made the Russian foot-soldiers such admirable automatons, strode General L—eff. He was a man fifty years of age, remarkable for his rigid deportment, his leanness, his tawny complexion, and his large gray restless eyes. He was distinguished in the army for his bravery—daring proofs of which he had given during the campaigns in Persia and Turkey. But whether, as was generally thought, domestic unhappiness had been the means of souring a temper naturally energetic, or that his heart had been hardened by the frequent application of the inexorable necessity of a discipline degrading in its principle, and too often monstrous in its effects, General L—eff was looked on as an object of terror by the soldiers; for not a day passed unsignalised by one or more of those acts of severity which might justly undergo the imputation of ferocity. It was known, however, that this man had an attachment for the daughter of one of his ancient comrades,

killed in the late war with Poland. Having adopted her, no parent ever showed more solicitude for his offspring than he evinced for the young orphan, and they were seldom separate. Although grateful for the kindness of the general, the young girl—to whom the soldiers had given the name of Solowoiva,* from the sweetness with which she sang the old and melancholy slave romances—could never overcome in his presence the unconquerable constraint which his brief address, imperious countenance, and cold and distant manners, imposed on those who approached him.

On the day when the following events took place, Solowoiva, who, to please the general, regularly attended all the exercises and parades, was seated before one of the barrack windows on a level with the parade-ground, looking quietly at the movements of the soldiers. A blush suffused her countenance as her eyes encountered those of a young military surgeon named Ivan Polovoi, dressed on this occasion with marked elegance in the simple uniform of his rank.

Already General L—eff had passed several times before the front of the battalion without speaking; but his bushy eyebrows contracted, and passion began to be visible in his countenance, when he found that a number of men were absent. His attention at this moment was arrested by a party of soldiers advancing towards him from the other end of the parade-ground, each carrying a long rod, used in the application of an abominable punishment which has not yet ceased in the Russian army. Turning towards one of his aides-de-camp, he demanded, in a voice of thunder, from whom the order had emanated, and who was to be punished.

A sergeant, remarkable for his livid and scarred appearance, rushed towards the general, snatched his sword from his hand, and struck him in the face with it, exclaiming, 'Yourself!'

The action had an effect like an electric shock on the ranks of the battalion, and the usually immoveable countenances of the soldiers seemed to brighten with an impulse of hatred. A spontaneous movement was made by the officers along the line to the assistance of their chief; but they were instantly seized, thrown to the ground, and a bayonet pointed against the breast of each. Ivan the surgeon had alone been left untouched; for, by his humanity and kindness, he had conciliated the goodwill of the troops. A grenadier, however, was stationed before him to act as a guard, who whispered in his ear, in a mysterious voice, 'Whether the Nightingale sings or not, remain quiet: not a gesture nor a cry, or you are a dead man!'

Recovering from his surprise, the general seized with both hands the bayonets presented to his breast; and having by a violent effort struck them aside, shouted, as his eye flashed along the battalion—'Down on your knees, vile brutes! Down on your knees and ask pardon—your heads in the dust, or you have not flesh enough on your backs to expiate your rebellion!'

His words were received with a shout of savage laughter, and the sergeant, with that peculiar tranquillity which distinguishes unshaken resolution, retorted—'We each and all of us know that our lives will be the penalty of what we now do. When the sentence passed on you shall be executed, we shall seek General Suroff, governor of Novgorod; we shall give up to him your sword, your decorations, and whatever may remain of your body, and say to him, "General L—eff was a tiger, and we have killed him; here are our arms; we look for our punishment!"' The sergeant, while speaking, tore the epaulettes from the general's shoulders, and trampled them under his feet. 'These insignia don't become you; the knout is fitter for an executioner. Remember the soldier Betsakoff, flogged with rods for having been too slow in carrying arms; remember the old *sans-officier* whom you reduced to the ranks for having a stain on his uniform, and whom you struck with your cane until the blood streamed from his forehead, his cheeks, and his lips; and because the unhappy old man, pale with shame, repulsed the hand which inflicted the indignity, he was condemned, flogged, and sent mutilated and dying to Siberia.' The sergeant continued with a terrible coolness this degrading scene, dragging off the general's belt and coat, and lastly his shirt.

In spite of his remarkable firmness, L—eff shuddered while he listened to the accusing voice, so eloquent in its simplicity, so calm and so measured even in its passion. As for Solowoiva, she sat for some time without being able to comprehend the strange scene passing before her eyes; but when the truth at length flashed on her, that her adopted father was about to undergo the odious chastisement which he had so often inflicted on others, she was seized with horror, and gave utterance to the most heart-rending cries. Ivan the surgeon, who till then had stood neuter, could not remain insensible to the despair of the young girl, and forgetting the warning he had received, and the ferocious exasperation of the soldiers, he advanced towards her. He had not gone many paces when a shot was fired, and the unfortunate young surgeon fell to the ground a corpse.

There is in most Russian regiments a kind of buffoon, who fills a situation somewhat resembling that held in the ancient German armies, to whom the soldiers applied the significant appellation of *Lustig*. One of these men, attached to the battalion, seeing the surgeon fall, approached the corpse, dancing and gesticulating, and, raising it in his robust arms, carried it towards where Solowoiva still sat, and depositing it immediately before her, exclaimed—'Here, my little singing bird, this is yours.' Pale with terror, the girl recognised the body as it rolled at her feet, and uttering a faint cry, sunk by its side.

While this scene was being enacted, General L—eff had been laid on a car, drawn along the ranks, and had received the *baguettes*—a terrible torture; which, however, was only the commencement of his sufferings. He had scarcely reached the extremity of the line when a voice exclaimed, 'Take him to the ovens!'

The general, whose spirit was already crushed, heard the words, and, too well comprehending their meaning, threw around him a look of supplication and terror.

'To the ovens!' shouted a hundred voices.

The countenance of the general became livid, and his body shook with terror: his pride had fled, and, groaning in agony, he asked for pardon. But the shouts of the battalion drowned his voice; and the sergeant, approaching his victim, said in a stern tone—'I also besought pity when my brother fell expiring under the baguettes.'

We shall not go into the details of the horrible scene which followed, unfortunately but too true. Suffice it to say, that the general and the superior officers of the battalion, shut up in the ovens, under which a slow fire was carefully renewed by the soldiers, were literally roasted alive.

Certainly the execution of the sentence had a terrible originality; yet the punishment was fully proportionate to the vengeance.

A mounted jager carried to the emperor the account of the fearful drama which had been enacted in Novgorod, and eight days afterwards several batteries of artillery entered the decayed capital of ancient Russia, preceded by a major-general, who, during the late war in Poland, had been known to the army under the title of the 'Butcher of Warsaw.'

One of his aides-de-camp was sent to the quarters of the mutineers, with an order to assemble the next day, without arms, on a small parade-ground at the eastern extremity of the town, and called the Tartar Camp. The soldiers replied to this mysterious injunction by the customary shout (*karacho*). The following day they dressed themselves, and arranged their mustaches, as if preparing for a simple parade; then pale, silent, their lips white with emotion, but still keeping their

* Nightingale.

ranks, they traversed the town through a triple row of Cossacks, followed by the mournful looks of the populace. Arrived upon the ground, they silently formed into square. At the same moment the drums beat, the belfries of the numerous Greek churches in Novgorod pealed, and the several batteries established at the entrances of the five long avenues leading into the field were suddenly unmasked, and the grape-shot began the work of extermination. Horrid shouts followed each discharge, and a heavy groaning, mingled with the interrupted songs of some of the dying soldiers. For three hours the discharge continued; and when the executioners of this bloody duty entered the place of punishment, they found it literally a lake of blood, and covered with mangled limbs. Five soldiers alone, who had been miraculously preserved, were found alive, and they expired under the knout. Among this latter number was the sergeant, who to the last moment manifested an extraordinary degree of fortitude in the midst of his sufferings.

Solowoiva, the adopted daughter of General L—eff, was taken under the protection of the empress, and placed in the society of noble Russian ladies at Smolnoï.

It may be necessary to add that the preceding details are not exaggerated in any respect. We present them as described by a respectable correspondent of a French newspaper, who mentions that he was an eye-witness of the scenes to which he alludes. From what is being daily disclosed of the savage character of Russian institutions, there seems no reason to doubt their accuracy.

THE PERILS OF ELEPHANT HUNTING.

Major Rogers had capital sport with a herd of these animals. His four guns had all been discharged, when an unseen elephant made a charge at him from the skirts of the jungle. There was no help for it except to run, and for one hundred yards the major kept just ahead, feeling at every step the animal's trunk trying to insinuate itself round his loins. A turn round a tree gave him a momentary advantage, which he made the most of, by springing up into the branches (he was as nimble as a cat, and as strong as a lion). One foot higher, and he would have been out of the elephant's reach; but before he had time to draw up his legs, the elephant had got him firmly clenched in the coils of his proboscis. Still Rogers pulled against him, thinking it better to have his leg wrenched from the socket than to fall back bodily into the animal's power. The struggle, however, did not last long; for, to the delight of the pursued and the chagrin of the pursuer, the Wellington boot that the former wore slipped off, extricated the leg, and saved the life of poor Rogers. (Heaven save us from such a boot-jack!) The dilemma, however, did not end here; for the elephant, finding himself baulked of his prey, after destroying the boot, took up his quarters beneath the branches, and kept its expected victim in the tree for twenty-four hours, when the *tappal*, or country postman, happening to pass by, Rogers gave him notice of his position, and on this being intimated to the nearest village, the elephant was frightened away by tom-toms and yellings. Had this occurred in a deserted part of the jungle, poor Rogers would indubitably have been starved to death in the tree.—*Sporting Magazine.*

PROFANE SWEARING.

When Sir Christopher Wren was building St Paul's cathedral, he caused the following notice to be affixed to several parts of the structure:—Whereas among labourers and others that ungodly custom of swearing is too frequently found, to the dishonour of God and contempt of his authority; and to the end that such impiety may be utterly banished from these works, which are intended for the service of God and the honour of religion, it is ordered that profane swearing shall be a sufficient crime to dismiss any labourer who comes to the call; and the clerk of the works, upon sufficient proof, shall dismiss him accordingly; and that if any master, working by task, shall not, upon admonition, reform the profanation among his apprentices, servants, and labourers, it shall be construed his fault, and he shall be liable to be censured by the commissioners.

TO A WINTER-BLOOMING WILD FLOWER.

Lone dweller in this bleak and barren spot,
That finds no shelter from the leafless tree,
Though very desolate may be thy lot,
Almost I wish that I resembled thee.

Not in thy beauty, flowret azure-hued!
Nor in thy faint, wind-wasted fragrancy—
Nor in the stillness of thy solitude—
My heart, companionless, would broken be.

But I, like thee, upspringing from the sod,
Would lift, through storms, a cheerful eye to Heaven,
Trusting the bounteous hand of Nature's God
Sunshine and storm for equal good hath given.

And though thy wintry doom may seem severe,
Uncheered by song of birds or kindred flower,
I do believe thou dost not blossom here
But by the will of that Almighty Power,
Who makes thy fragile bloom an instrument
To teach a proud and murmuring heart content.

H. C. Caddick.

SOMETHING FOR ALL.

So various is the appetite of animals, that there is scarcely any plant which is not chosen by some, and left untouched by others. The horse gives up the water-hemlock to the goat; the cow gives up the long-leaved water-hemlock to the sheep; the goat gives up the monk's-hood to the horse, &c.; for that which certain animals grow fat upon, others abhor as poison. Hence no plant is absolutely poisonous, but only respectively. Thus the spurge, that is noxious to man, is a most wholesome nourishment to the caterpillar. That animals may not destroy themselves for the want of knowing this law, each of them is guarded by such a delicacy of taste and smell, that they can easily distinguish what is pernicious from what is wholesome; and when it happens that different animals live upon the same plants, still one kind always leaves something for the other, as the mouths of all are not equally adapted to lay hold of the grass; by which means there is sufficient food for all. To this may be referred an economical experiment well known to the Dutch, that when eight cows have been in a pasture, and can no longer get nourishment, two horses will do very well there for some days, and when nothing is left for the horses, four sheep will live upon it.—*Stillingfleet.*

GOLD-PRINTED MUSLINS.

Among the numerous successes of the year 1845 in decorative art, we must notice a very beautiful muslin fabric, for curtains, printed in gold by a galvanic process, and patented by Messrs Vallé and Company of Manchester. This new system of gold-printing is intended to supersede the more expensive mode of embroidering fabrics with gold and silver for window-curtains and other drapery. It is peculiarly adapted for long drawing-room curtains. The designs are chaste and classical; the brilliancy of the gold-printing is rather heightened than impaired by washing, so that the fabric is as economical as it is elegant.—*Year-Book of Facts.*

EDITORIAL NOTE.

A reader points out that the short paper entitled 'The Gauger's Run,' which appeared in No. 109, is copied, with slight differences of language, from *Sketches in Ireland* (Dublin: Curry and Co. 1829), without acknowledgment. On investigation, we find this to be the case. We can only say that we received the article in manuscript from a contributor—one apparently occupying a respectable station in life—and paid for it as original. It must be regretted that there should be persons who, in ignorance or from bad design, can thus mislead the editors of periodical works. We sincerely regret the circumstance, mainly because it is a violation of literary justice; and in a less degree, but still poignantly, because it tends to lessen the confidence of our readers in the originality of the mass of matter which we weekly present as new.

No. 114. New Series. SATURDAY, MARCH 7, 1846. Price 1½d.

THE STORY OF LADY GRANGE.

The person called, by the courtesy of Scotland, Lady Grange, was the wife of the Honourable James Erskine, a judge of the Court of Session, younger brother of that Earl of Mar who headed an insurrection against the house of Brunswick in 1715. Lord Grange, as this judge was designated, passed through life as a leader in the Whig or Presbyterian party in his native country, and as one professing high evangelical principles; and probably he would not now have been remembered for either good or evil, if he had not acted an extraordinary part towards his wife. The history of that lady gives us a curious idea of the state of manners in Scotland in the early part of last century.

We are prepared for something tragic by the parentage of Lady Grange. In Edinburgh, on a Sunday afternoon in the spring of the year 1689, the president of the Court of Session was walking quietly home from church, when a pistol-shot, fired close behind him, brought him to the ground a corpse. Amongst the crowd who gathered round the spot stood a gloomy-looking man, who, when he heard that the venerable judge had died instantly, remarked that he was not accustomed to do things by halves. This man, who had been led to commit the murder in revenge for an award of the president, commanding him to make provision for his wife and family, and who expiated his crime with his life, was the father of Mrs Erskine, born Rachel Chiesly. In the present comparatively enlightened age, we can understand how there might be a predisposition to insanity in such a family, apt to show itself at ordinary moments in incontrollable bad temper, and occasionally in wild and lamentable acts. But in those days such considerations did not occur.

Lord and Lady Grange had been married upwards of twenty years, and had had several children, when, in 1730, a separation was determined on between them. It is usually difficult in such cases to say in what degree the parties are respectively blameable; how far there have been positive faults on one side, and want of forbearance on the other, and so forth. If we were to believe the lady in this instance, there had been love and peace for twenty years, when at length Lord Grange took a sudden dislike to his wife, and would no longer live with her. He, on the other hand, speaks of having suffered long from her 'unsubduable rage and madness,' and of having failed in all his efforts to bring her to a reasonable conduct. There is too much reason to believe that the latter statement is in the main true; although, were it more so, it would still leave Lord Grange unjustifiable in the measures which he took with respect to his wife. It is traditionally stated that, in their unhappy quarrels, the lady did not scruple to remind her husband whose daughter she was—thus hinting at what she was capable of doing if she thought herself deeply aggrieved. However all this might be, in the year 1730 a separation was agreed to (with great reluctance on the part of the lady), his lordship agreeing to give her a hundred a-year for her maintenance, so long as she should continue to live apart from him.

After spending some months in the country, Lady Grange returned to Edinburgh, and took a lodging near her husband's house, for the purpose, as she tells us, of endeavouring to induce him to take her back, and that she might occasionally see her children. According to Lord Grange, she began to torment him by following him and the children on the street 'in a scandalous and shameful manner,' and coming to his house, and calling reproaches to him through the windows,* especially when there was company with him. He thus writes—'In his house, at the bottom of Niddry's Wynd, where there is a court through which one enters the house, one time among others, when it was full of chairs, chairmen, and footmen, who attended the company that were with himself, or his sister Lady Jane Paterson, then keeping house together, she came into this court, and among that mob shamelessly cried up to the windows injurious reproaches, and would not go away, though intreated, till, hearing the late Lord Lovat's voice, who was visiting Mr E——, and seeing two of his servants among the other footmen, "Oh," said she, "is your master here?" and instantly ran off.' He speaks of her having attacked him one day in church; at another time she forced him to take refuge with his son in a tavern for two hours. She even threatened to assault him on the bench, 'which he every day expected; for she professed that she had no shame.'

The traditionary account of Lady Grange represents her fate as having been at last decided by her threatening to expose her husband to the government for certain treasonable practices. It would now appear that this was partially true. In his statement, Lord Grange tells us that he had some time before gone to London, to arrange the private affairs of the Countess of Mar, then become unable to conduct them herself, and he had sent an account of his procedure to his wife, including some reflections on a certain great minister (doubtless Walpole), who had thwarted him much, and been of serious detriment to the interests of his family in this matter. This document she retained, and she now threatened to take it to London, and use it for her husband's disadvantage, being supported in the design by several persons with whom she associated. While denying that he had been concerned in anything treasonable, Lord Grange says,

* We here and elsewhere quote a paper in Lord Grange's own hand.

'he had already too great a load of that great minister's wrath on his back to stand still and see more of it fall upon him by the treachery and madness of such a wife and such worthy confederates.' The lady had taken a seat in a stage-coach for London.* Lord Grange caused a friend to go and make interest to get her money returned, and the seat let to another person: in which odd proceeding he was successful. Thus was the journey stayed for the meantime; but the lady declared her resolution to go as soon as possible. 'What,' says Lord Grange, 'could a man do with such a wife? There was great reason to think she would daily go on to do mischief to her family, and to affront and bring a blot on her children, especially her daughters. There were things that could not be redressed in a court of justice, and we had not then a madhouse to lock such unhappy people up in.'

The result of his lordship's deliberations was a plan for what he delicately calls 'sequestrating' his wife. It appears to have been concerted between himself and a number of Highland chiefs, including, above all, the notorious Lord Lovat, who a few years after was to conclude a long life of treachery, cruelty, and selfish ambition on Tower Hill. We now turn to the lady's narrative, which proceeds to tell that, on the evening of the 22d of January 1732, a party of Highlandmen, wearing the livery of Lord Lovat, made their way into her lodgings, and forcibly seized her, throwing her down and gagging her, then tying a cloth over her head, and carrying her off as if she had been a corpse. At the bottom of the stair was a chair containing a man, who took the hapless lady upon his knees, and held her fast in his arms till they had got to a place in the outskirts of the town. Then they took her from the chair, removed the cloth from her head, and mounted her upon a horse behind a man, to whom she was tied; after which the party rode off 'by the lee light of the moon,' to quote the language of the old ballads, whose incidents the present resembles in character.

The treatment of the lady by the way was, if we can believe her own account, by no means gentle. The leader, although a gentleman (Mr Forster of Corsebonny), disregarded her intreaties to be allowed to stop on account of cramp in her side, and only answered by ordering a servant to renew the bandages over her mouth. She observed that they rode along the Long Way (where Princes Street now stands), past the castle, and so to the Linlithgow road. After a ride of nearly twenty miles, they stopped at Muiravonside, the house of Mr John Macleod, advocate, where servants appeared waiting to receive the lady—and thus showed that the master of the house had been engaged to aid in her abduction. She was taken up stairs to a comfortable bedroom; but a man being posted in the room as a guard, she could not go to bed nor take any repose. Thus she spent the ensuing day, and when it was night, she was taken out and remounted in the same fashion as before; and the party then rode along through the Torwood, and so to the place called Wester Polmaise, belonging to a gentleman of the name of Stewart, whose steward or factor was one of the cavalcade. Here was an old tower, having one little room on each floor, as is usually the case in such buildings; and into one of these rooms, the window of which was boarded over, the lady was conducted. She continued here for thirteen or fourteen weeks, supplied with a sufficiency of the comforts of life, but never allowed to go into the open air: till at length her health gave way, and the factor began to fear being concerned in her death. By his intercession with Mr Forster, she was then permitted to go into the court, under a guard; but such was the rigour of her keepers, that the garden was still denied to her.

Thus time passed drearily on until the month of August, during all which time the prisoner had no communication with the external world. At length, by an arrangement made between Lord Lovat and Mr Forster, at the house of the latter near Stirling, Lady Grange was one night forcibly brought out and mounted again as formerly, and carried off amidst a guard of horsemen. She recognised several of Lovat's people in this troop, and found Forster once more in command. They passed by Stirling Bridge, and thence onward to the Highlands, but she no longer knew the way they were going. Before daylight they stopped at a house, where she was lodged during the day, and at night the march was resumed. Thus they journeyed for several days into the Highlands, never allowing the unfortunate lady to speak, and taking the most rigid care to prevent any one from becoming aware of her situation. During this time she never had off her clothes: one day she slept in a barn, another in an open enclosure. Regard to delicacy in such a case was impossible. After a fortnight spent at a house on Lord Lovat's ground (probably in Stratherrick, Inverness-shire), the journey was renewed in the same style as before; only Mr Forster had retired from the party, and the lady found herself entirely in the hands of Frasers.

They now crossed a loch into Glengarry's land, where they lodged several nights in cow-houses, or in the open air, making progress all the time to the westward, where the country becomes extremely wild. At Lochourn, an arm of the sea on the west coast, the unfortunate lady was transferred to a small vessel which was in waiting for her. Bitterly did she weep, and pitifully implore compassion; but the Highlanders understood not her language, and though they had done so, a departure from the orders which had been given them was not to be expected from men of their character. In the vessel she found that she was in the custody of one Alexander Macdonald, a tenant of one of the western islands named Heskir, belonging to Sir Alexander Macdonald of Sleat; and here we have a curious indication of the spirit in which the Highlanders conducted such transactions. 'I told him,' says the lady, 'that I was stolen at Edinburgh, and brought there by force, and that it was contrary to the laws what they were doing. He answered that he would not keep me, or any other, against their will, *except Sir Alexander Macdonald were in the affair.*' While they lay in Lochourn, waiting for a wind, the brother and son of Macdonald of Scothouse came to see, but not to relieve her. Other persons visited the sloop, and among these one William Tolmy, a tenant of the chief of Macleod, and who had once been a merchant at Inverness. This was the first person she had seen who expressed any sympathy with her. He undertook to bear information of her retreat to her friend and 'man of business,' Mr Hope of Rankeillor, in Edinburgh; but it does not appear that he fulfilled his promise.

Lady Grange remained in Macdonald's charge at Heskir nearly two years—during the first year without once seeing bread, and with no supply of clothing; obliged, in fact, to live in the same miserable way as the rest of the family; afterwards some little indulgence

* 'Then, and some time before and after, there was a stage-coach from hence to England;' so says his lordship; implying that, in 1751, when he was writing, there was no such public convenience! It had been tried, and had failed.

was shown to her. This island was of desolate aspect, and had no inhabitant besides Macdonald and his wife: the wretchedness of such a situation for a lady who had been all her life accustomed to the refined society of a capital may of course be imagined. Macdonald would never allow her to write to any one; but he went to his landlord, Sir Alexander, to plead for the indulgences she required. On one of these occasions, Sir Alexander expressed his regret at having been concerned in such an affair, and wished he were quit of it. The wonder is, how Erskine should have induced all these men to interest themselves in the 'sequestration' of his wife. One thing is here remarkable: they were all of them friends of the Stuart family, as was Macleod of Macleod, into whose hands the lady subsequently fell. It therefore becomes probable that Erskine had at least convinced them that her seclusion from the world was necessary in some way for the preservation of political secrets important to them.

In June 1734 a sloop came to Heskir to take away the lady; it was commanded by a Macleod, and in it she was conveyed to the remotest spot of ground connected with the British islands; namely, the isle of St Kilda, the property of the chief of Macleod, and remarkable for the simple character of the poor peasantry who occupy it. There cannot, of course, be a doubt that those who had an interest in the seclusion of Lady Grange, regarded this as a more eligible place than Heskir, in as far as it was more out of the way, and promised better for her complete and permanent confinement. In some respects it was an advantageous change for the lady: the place was not uninhabited, as Heskir very nearly was; and her domestic accommodation was better. In St Kilda, she was placed in a house or cottage of two small apartments, tolerably well-furnished, with a girl to wait upon her, and provided with a sufficiency of good food and clothing. Of educated persons the island contained not one, except for a short time a Highland Presbyterian clergyman named Roderick Maclennan. There was hardly even a person capable of speaking or understanding the English language within reach. No books, no intelligence from the world in which she had once lived. Only once a-year did a steward come to collect the rent paid in kind by the poor people; and by him was the lady regularly furnished with a store of such articles foreign to the place as she needed; usually a stone of sugar, a pound of tea, six pecks of wheat, and an anker of spirits. Thus she had no lack of the common necessaries of life: she only wanted society and freedom. In this way she spent seven dreary years in St Kilda. How she contrived to pass her time, we have no means of knowing. We learn, however, some particulars of her history during this period from the testimony of those who had a charge over her. If this is to be believed, she made incessant efforts, though without effect, to bribe the islanders to assist in liberating her. Once a stray vessel sent a boat ashore for water: she no sooner heard of it, than she despatched the minister's wife to apprise the sailors of her situation, and intreat them to rescue her; but Mrs Maclennan did not reach the spot till after they had departed. She was kind to the peasantry, giving them from her own stores; and sometimes had the women to come and dance before her; but her temper and habits were not such as to gain their esteem. Often she drank too much, and whenever any one near her committed the slightest mistake, she would fly into a furious passion, and even resort to violence. Once she was detected in an attempt during the night to obtain a pistol from above the steward's bed in the room next to her own: on his awaking and seeing her, she ran off to her own bed. One is disposed, of course, to make all possible allowances for a person in her wretched circumstances; yet there can be little doubt, from the evidence before us, that it was a natural and habitual violence of temper which displayed itself during her residence in St Kilda.

Meanwhile it was known in Edinburgh that Lady Grange had been forcibly carried away and placed in seclusion by orders of her husband; but her whereabouts was a mystery to all besides a few who were concerned to keep it secret. During the years which had elapsed since her abduction, Mr Erskine had given up his seat on the bench, and entered into political life as a friend of the Prince of Wales, and opponent of Sir Robert Walpole. The world had wondered at the events of his domestic life, and several persons denounced the singular means he had adopted for obtaining domestic peace. But, in the main, he stood as well with society as he had ever done. At length, in the winter of 1740–1, a communication from Lady Grange for the first time reached her friends. It was brought by the minister Maclennan and his wife, who had left the island in discontent, after quarrelling with Macleod's steward. The idea of a lady by birth and education being immured for a series of years in an outlandish place, where only the most illiterate peasantry resided, and this by the command of a husband who could only complain of her irritable temper, struck forcibly upon public feeling, and particularly upon the mind of Lady Grange's legal agent, Mr Hope of Rankeillor, who had all along felt a keen interest in her fate. Of Mr Hope it may be remarked that he was also a zealous Jacobite; yet, though all the persons engaged in the lady's abduction were of that party, he hesitated not to take active measures on the contrary side. He immediately applied to the Lord Justice Clerk (supreme criminal judge) for a warrant to search for and liberate Lady Grange. This application was opposed by the friends of Mr Erskine; and eventually it was defeated: yet he was not on that account deterred from hiring a vessel, and sending it with armed men to secure the freedom of the lady—a step which, as it was illegal and dangerous, obviously implied no small risk on his own part. This ship proceeded no farther than the harbour called the Horse-shoe in Lorn (now, we believe, the seat of the thriving *young* town of Oban), where the master quarrelled with and set on shore Mrs Maclennan, his guide. Apparently the voyage was not prosecuted, in consequence of intelligence being received that the lady had been removed to another place, where she was kept in more humane circumstances. If so, its object might be considered as in part at least, though indirectly, accomplished.

There lies before us a warrant, signed in the holograph of Normand Macleod—the same insular chief who, a few years after, lost public respect in consequence of his desertion of the Jacobite cause, and showing an active hostility to Prince Charles when in hiding. The document is dated at Dunvegan, February 17, 1741, and proceeds upon a rumour which has reached the writer, that a certain gentlewoman, called Lady Grange, was carried to his isle of St Kilda in 1734, and has ever since been confined there under cruel circumstances. Regarding this as a scandal which he is bound to inquire into (as if it could have hitherto been a secret to him), he orders his baron-bailie of Harrish, Donald Macleod of Bernera [this was a gallant fellow, who went out in the forty-five], to proceed to that island and make the necessary investigations. Before us also lies the original precognition taken by honest Donald, six days thereafter, when the various persons who had been about Lady Grange gave evidence respecting her. The general bearing of this testimony, besides establishing the fact of her confinement as a prisoner, is to the effect that she was treated well in all other respects, having a house forty feet long, with an inner room and a chimney to it, a curtained bed, arm-chair, table, and other articles; ample store of good provisions, including spirits; and plenty of good clothes; but that she was addicted to liquor, and liable to dreadful outbreaks of anger. Evidence was at the same time taken regarding the character of the Maclennans, upon whose reports Mr Hope had proceeded. It was Mr Erskine's interest to establish that they were worthless persons, and to this effect strong testimony was given by several of the islanders, though it would be difficult to say with what

degree of verity. The whole purpose of these precognitions was to meet the clamours raised by Mr Hope as to the barbarities to which Lady Grange had been subjected. They had the effect of stopping for a time the legal proceedings threatened by that gentleman; but he afterwards raised an action in the Court of Session for payment of the arrears of aliment or allowance due to the lady, amounting to L.1150, and obtained decreet or judgment in the year 1743 against the defender in absence; though he did not choose to put it in force.

The unfortunate cause of all these proceedings ceased to be a trouble to any one in May 1745. Erskine, writing from Westminster, June 1, in answer to an intimation of her death, says, 'I most heartily thank you, my dear friend, for the timely notice you gave me of the death of *that person*. It would be a ridiculous untruth to pretend grief for it; but as it brings to my mind a train of various things for many years back, it gives me concern. Her retaining wit and facetiousness to the last surprises me. These qualities none found in her, no more than common sense or good nature, before she went to these parts; and of the reverse of all which, if she had not been irrecoverably possest, in an extraordinary and insufferable degree, after many years' fruitless endeavours to reclaim her, she had never seen these parts. I long for the particulars of her death, which, you are pleased to tell me, I am to have by next post.'

Mr Hope's wife and daughters being left as heirs of Lady Grange, an action was raised in their name for the L.1150 formerly awarded, and for three years additional of her annuity; and for this compound sum decreet was obtained, which was followed by steps for forcing payment. The Hopes were aware, however, of the dubious character of this claim, seeing that Mr Erskine, from whatever causes, had substituted an actual subsistence since 1732. They accordingly intimated that they aimed at no personal benefit from Lady Grange's bequest; and the affair terminated in Mr Erskine reimbursing Mr Hope for all the expenses he had incurred on behalf of the lady, including that for the sloop which he had hired to proceed to St Kilda for her rescue.

It is humbly thought that this story casts a curious and faithful light upon the age of our grandfathers, showing things in a kind of transition from the sanguinary violence of an earlier age to the humanity of the present times. Erskine, not to speak of his office of a judge in Scotland, moved in English society of the highest character. He must have been the friend of Lyttelton, Pope, Thomson, and other ornaments of Frederick's court; and, as the brother-in-law of the Countess of Mar, who was sister of Lady Mary Wortley Montagu, he would figure in the brilliant circle which surrounded that star of the age of the second George. Yet he does not appear to have ever felt a moment's compunction at leaving the mother of his children to pine and fret herself to death in a half-savage wilderness,

'Placed far amidst the melancholy main;'

for, in a paper which expresses his feelings on the subject pretty freely, he justifies the 'sequestration' as a step required by prudence and decency; and, in showing that the gross necessaries of life were afforded to his wife, seems to have considered that his whole duty towards her was discharged. Such an insensibility could not be peculiar to one man: it indicates the temper of a class and of an age. While congratulating ourselves on the improved humanity of our own times, we may glance with satisfaction to the means which it places in our power for the proper treatment of patients like Mrs Erskine. Such a woman would now be regarded as the unfortunate victim of disease, and instead of being forcibly carried off under cloud of night by a band of Highlanders, and committed to confinement on the outskirts of the world, she would, with proper precautions, be remitted to an asylum, where, by gentle and rational management, it might be hoped that she would be restored to mental health, or, at the worst, enabled to spend the remainder of her days in the utmost comfort which her state admitted of.

A WEEK IN SEVILLE.

Seville, the capital of Andalusia, is generally considered to afford a better picture of the peculiar customs and mode of life of this celebrated and remarkable province, than any other town within its confines. It is quite true that, of late years, it has lost much of its national character, but still the habits and manners of this ancient city are much more free from foreign admixture than those of Cadiz or Malaga, which, being seaports, and possessing a considerable trade, have naturally great intercourse with foreign nations.

Seville, therefore, I have selected from amid the many towns visited by me in the course of my late peregrinations, as most fit to show what Spain, or at least Andalusia, is at the present moment. This place is the residence of many wealthy landowners or *proprietarios*, as well as of several ancient noble families of Spain; and though still possessing some foreign and domestic trade, may be rather looked on as an agricultural than as a commercial locality. Many Indian, Manilla, and American merchants, make this the spot where they retire with their families, after making their fortunes, to enjoy repose during the remnant of their days. Many, however, from the mere force of habit, continue even here their commercial enterprises on a moderate scale. These, with the landowners and ancient aristocracy, form the upper class of Sevillian society, the nobility being no longer a separate class. The next grade is that of the shopkeepers, between whom, however, and the artisans, there is scarcely a line of demarcation. The celebrated university produces a distinct class in the students, who number as many as two thousand, and give illustrations of almost every provincial character in Spain.

Seville is situated on the eastern bank of the Guadalquiver, at the distance of about sixty miles from the sea, towards the northern part of an immense plain, extending leagues on both sides of the river, during the whole of its course from Seville to St Luca, where it falls into the ocean. Towards the coast, this plain is generally a marshy swamp, though here and there extensive districts afford pasture for herds of cattle and flocks of sheep. As, however, we ascended the river, the land increased in fertility, and near Seville it presented smiling corn-fields, and the olive-groves which gladden the hearts and fill the pockets of the Sevillians. The approach to the city reminded us of New Orleans, the course of the river being tortuous in the extreme, so that we sailed many hours without advancing a mile nearer to the town. For some distance there was little worthy of notice, except grazing cattle, passing-boats with their graceful lateen sails, or here and there some fishermen pursuing their silent avocations; but as we neared Seville, several white and light-looking little villages presented themselves to our view, picturesquely peeping from amid the orange groves, some at a distance, others planted on the very banks of the river.

Passing these, and when less than half a mile distant, Seville bursts upon the view. On the right bank, on a level with the eye, we beheld the Delicias, one of the boasts of Seville. And justly so, for these delightful walks, extending from abreast our vessel to the very entrance of the town, set an example which we should

gladly see universally followed, and more particularly in our own land. The banks of the river rise about fifteen or twenty feet above the level of the water. They descend somewhat abruptly, but are nevertheless thickly planted with trees and shrubs of various species, amid which the weeping-willow is conspicuous. On the summit of the bank, close to the edge, are avenues of trees, whose grateful shade, aided by the passing breeze, serves to temper the sun's rays to the promenading belles of Seville. A delicious fragrance here fills the air — a fragrance so new to an Englishman, as to excite his wonder and admiration. Not all the perfumeries of Paris and London could equal this vast nosegay, which was here filling the air. Beyond the stately Delicias are several orange plantations, the trees in full bloom, and from these it was that the sweet and almost overpowering odour proceeded.

Shooting along, we caught sight of the Torre del Ovo, which rears its gigantic head near the landing-place. On the right bank of the river, at the end of the Delicias, is the marine college of St Elmo; while in the distance beyond rises the cathedral with its lofty tower. The borders of the river are lined with the country boats, and vessels from foreign parts, loading and unloading. One or two steamers, moored to wharfs, marked the progress of improvement. Beyond was the bridge of boats, connecting the city with a populous suburb on the other side of the river, called Triana, which has nothing in its appearance to attract much attention, except the now deserted convent of Los Remedios, with an extensive garden attached to it. In the distance, the view is bounded by a range of pleasant-looking hills, covered with corn-fields and olive-groves, with an occasional convent rising from amid the verdure, and giving interest and variety to the landscape. Entering the town, we found it so level, that no good view could be obtained of it except by ascending the hills beyond Triana, about a mile distant, whence we afterwards enjoyed a perfect panoramic display.

Seville is of rather an oval form, entirely surrounded by walls of Moorish construction. The circumference is rather more than 8000 Castilian yards; while it has thirteen gates and two posterns, the principal being the Puerta de Triana, Del Arenal, and De Xeres. The suburb called Triana is not walled, but is always considered as forming part of the city of Seville, which has nearly 600 streets, the population being from 120,000 to 150,000. The number of convents it formerly contained is almost incredible; but as many are now pulled down, others falling to decay, while some are converted into manufactories and barracks, it is difficult to form an idea of what the number originally was. The parish churches, and Ayudas de Parroquia, or chapels of ease, are about 80 or 90 in number.

The Sevillian streets have very curious names, many taking their appellation no doubt from some tale or tradition. In the course of our rambles we found ourselves in the street of the Witch's Oven—of the Iron Purse—of the Dead Moor—of the Lost Child—or of the Little Fat Abbot. Many are named after the saints, and other matters connected with the Romish religion: we have thus five streets of the Rosary, eight of the Crosses, six of the Angels, four of the Bells, two of the Marvels, three of the Virgin, and three called after the Saviour. We found six that bore the name of Dirty, and many more that deserved the appellation; also, 'Thou Shalt Not Grind Street'—Street of the Pocket—Flea Street—Pig Street—Donkey Street—of the Fine Countenance—of the Man of Stone—of the Back Tooth; and many others which could not be named to ears polite. A lady who has long resided in Seville, favoured us with the following legend in connexion with the subject, which we give in her own words:—

'When the celebrated Don Pedro, known in Spanish history as *the* Cruel, reigned in Seville, he was in the habit of walking by night through its dark, narrow, and crooked streets, in the common dress of the Spaniards of those times. The practice of making love at the iron-grated windows—a custom still extant—and the jealous character of the Spaniards, who always carried swords with them, gave rise to innumerable street brawls, in which Don Pedro used very often to play a conspicuous part. During one of these night adventures the noise made by two men, who were fighting in the streets, attracted the attention of an old woman, who, opening her window, and looking out, saw one of the men fall, and recognised as his murderer, by the peculiar cracking of his knees, the awful Don Pedro el Cruel. She started back, and in her fright let fall the lamp called *candil*, or *candilejo*, which, being picked up next day by the officers of justice, served to prove that she knew something about the crime that had been committed so near her door. She was taken before the judges, who, according to the barbarous practice of the times, ordered her to be tortured, until she should reveal everything she knew about the murder. Notwithstanding her sufferings, and though she told every other circumstance of the quarrel she knew, she obstinately refused to pronounce the name of the murderer.

'The judges, enraged at this obstinacy, had ordered fresh tortures to be inflicted on the wretched old woman, when Don Pedro, who had been all the time present, wrapped up in a common cloak, made himself known, and ordered the woman to be released. He acknowledged himself the murderer, adding, that, as king, he was answerable for his actions to God alone. He made the woman a handsome present, and directed—perhaps as an expiation of his crime—that a stone bust of himself should be placed where it had been perpetrated. The existence of this rough monument, the name of the street near to it (Calle del *Candilejo*), the fact of the legend being mentioned by several historians, and the constant tradition that has been preserved amongst the people of Seville, seem to vouch for the truth of this singular story.'

The streets are nearly all crooked, and exceedingly narrow, so much so in some places that a person could touch both walls with his elbows. The foot-pavements are very narrow, but good; the carriage-way is paved with stones of all sizes and shapes, with a gutter in the centre, generally in a very bad state. There are about fifty plazas or squares, all of an irregular form, and some so small as hardly to be worthy of the appellation.

Many of the principal houses have an imposing exterior, and display considerable architectural taste in the porticos and front elevation. Still more, however, is displayed in the patio, or open courtyard. The houses are built on the principle of a hollow square, for the purpose of exposing the apartments more readily to the air during the heat of summer. The principal parts are the ground-floor, which is occupied in summer, and the upper, which is occupied during the winter. The doors and some of the windows of these apartments open on the patio, which is paved with black and white marble, and adorned with vases containing choice shrubs and flowers. In the centre is a fountain, while at the side are marble columns, supporting arches, which form the basis of the gallery that runs round the upper storey, and forms the means of communication between the different apartments of that floor. The entrance is effected through the cancela, or iron gate, wrought in the lightest, most elegant, and imaginative patterns. The taste and variety displayed in the manufacture of such gates is highly creditable to the Sevillians. It is in this delightful part that the inhabitants spend the summer months, cooled by the freshness of the shade, the flowers, and the fountains: here they receive visitors, hold tertulias, and pass the whole of their time, the heat in the upper storey being so great, as to cause it to be entirely deserted. Between the cancela and the street

is the portal, or outer hall, left open during the day, but closed at night by a massive wooden door.

The rooms and outer walls are whitewashed, and the former generally are furnished with great simplicity: the brick floors are covered in winter with thick, and in summer with light mats. The whole glare of the walls is relieved by paintings or engravings; while the tables and chairs are of a very slight and cheap description. The sala or drawing-room, which is, however, little used, is generally furnished after the English or French fashion—substituting lime-wash for paper-hanging, and painted joists for stuccoed ceilings. In few houses are seen chimneys or fireplaces, the mode of warming their apartments and persons during the winter being by means of *brazeros*, or large brass pans, full of hot charcoal, raised on a circular wooden frame, with a ledge whereon to place the feet. Stooping over and huddling round this unhealthy fire, and inhaling its noxious but invisible vapours, the Seville ladies pass the greater portion of the winter, complaining of colds, coughs, and headaches, without considering or suspecting that the insalubrious fumes of carbon is the cause of many of their complaints and indispositions. The great number of windows which are necessary for ventilation in warm weather render the houses very comfortless, and anything but desirable, in the cold.

The public walks are the old Alameda, which are very extensive; but, being situated in an unfashionable quarter, are now deserted. The Plaza del Duque, a small confined square in the middle of the city, surrounded by houses, has a fountain in its centre, out of which rises an obelisk, having on each side the representation of some nondescript animal, from whose mouth drops the water. A few unhappy-looking trees surround it, under whose shade are brick seats, covered with plaster. This is most frequented during the dog days—or rather nights, for no one then feels inclined to stir out in the sunshine. About ten at night people begin to throng this place, and the concourse is generally so great, that moving about is a matter of some difficulty. The stationary seats are not found sufficient, and moveable ones are hired for a halfpenny. Round the square are booths for the sale of cool water, and refreshments of all kinds. Orangeade, lemonade, orchata, vinegrada, &c. are the liquids most in demand. I have seldom been within the influence of a more picturesque scene than when walking here in summer, by the light of the moon or stars, until perhaps two in the morning, when the crowds begin to disperse.

In addition to this, I visited the Salon de Cristina, a short distance outside the walls on the banks of the river, between the Torre del Ovo and the Delicias. This is really a noble walk, being a raised platform paved with stone, and entirely surrounded by a bench of marble, backed by low iron railings, and overhung by trees. It is about a furlong in length, and of considerable width, while the means of access to it is confined to steps at each end. The parterres below are filled with odoriferous shrubs and flowers, which fill the air with a delicious fragrance. These again are intersected by walks, furnished with seats, the more agreeable that the trees arch overhead, and entirely protect the walker from the sun's rays. The Salon de Cristina may be called the State Paseo, being most frequented on state occasions and field days. It is also customary in the spring of the year for the promenaders to take a few turns up and down in the dusk of the evening, on their return from the Delicias, which are situated beyond the college of St Elmo. They cover much ground, and are intersected by carriage-roads and avenues diverging from a common centre. The greater portion is a thick wood, through which shady walks have been cut, adorned by rows of orange trees, whose branches and blossoms are seen thickly interspersed with roses, the whole shedding a delicious perfume.

The shops are generally good, though all first-rate articles are very dear, being either of English, French, or German manufacture, introduced under a very high duty, or smuggled. With few exceptions, the shopkeepers make a rule of asking a most exorbitant price for their commodities—a price they never expect to obtain. So much is this the custom, that the dealers have been known to return part of the money when the purchaser has incautiously paid the price asked. The following anecdote may serve as a caution to travellers:—'Taking up a miserable unbound copy of an Italian translation of Virgil from a stall in the streets, my friend asked the man what he wanted for it. "Twenty-two francs," said he with the utmost gravity. My friend smiled, and walked away, when the man ran after him, and asked what he was willing to give for it. "Well, two francs, possibly." "La prende, la prende—(take it, take it)," said he.' There are some shops that announce, in gold letters, that they sell at fixed prices; but they are not much patronised, as not affording the same amusement to the fair buyers. The goods are not often displayed in the windows, as the shops are mostly open towards the street. The front is divided into two parts by a marble column, and is shaded in summer by a curtain, and in winter shut in by glass doors. In temperate weather, however, these doors are thrown back, and the shop is open to the street.

Coffee-houses abound, two or three being neatly decorated, and well lighted, though in general the contrary is the case. In the evenings they are much frequented by men of all classes in society—dukes, marquises, merchants, students, farmers, smugglers, shopkeepers, shopmen—taking their coffee, lemonade, or punch, playing at dominoes, reading the papers, discussing politics, talking scandal, making bargains, telling stories; while others are seen silently smoking and waiting for their friends, or bargaining for lottery tickets. Now and then is heard a round of applause from the billiard-room, situated above, and much sought after by the Spaniard. The scene is further enlivened by the entrance of beggars, hawkers of lottery tickets, stray dogs, and pickpockets. Here may be seen the elegant dress-coat, the glossy Paris hat, the Andalusian cloak and round hat, the many-coloured jacket of the country, and the beggar in his parti-coloured rags.

Tea is bad, and coffee excellent, while lemonade and orangeade are generally good and refreshing. One favourite beverage is made by mixing bottled beer and orangeade in a punch-bowl; while punch of various kinds are popular. The walls of the coffee-rooms are hung with a few inferior prints, and the floor is thickly covered in winter with sawdust. Even in the very best houses the furniture consists of painted deal tables, and rush or wooden-bottomed chairs. The attendance is good, and the prices moderate—about twopence-halfpenny for coffee, tea, lemonade, &c. Despite the great variety of characters frequenting these places, they are peaceable, disturbances and quarrels being seldom heard. It is a custom among the Sevillians to insist upon paying for the coffee of their acquaintances, or even strangers, at the same table; and many are the amicable disputes which thence ensue. On tendering the amount of articles consumed, a stranger will often find it has been paid for; by whom, he knows not, and perhaps never discovers.

There are two theatres, the principal of which produces operas and comedies alternately. It is a large house neatly decorated in the Arabesque style. The pit is divided into stalls, every seat being numbered. There are three tiers of boxes, each box being let for the season or night; but no public ones. The gallery is set apart for ladies, who may not feel disposed to go to the expense of a box, the pit being wholly appropriated to men. Admission is by ticket only; and if you purchase a number in the pit, the seat is reserved for you, and you keep it all the evening. The house is lighted by a chandelier of oil lamps, with tin reflectors. The performances are generally indifferent, and the scenery worse. Light pieces, interspersed with dancing, are the favourites. The other theatre is of an inferior order, and was formerly a convent!

Many other objects, chiefly of an architectural or antiquarian nature, came under our observation; but as these might be wanting in interest to the general reader, we here close the narrative of our brief acquaintance with life and manners in Seville.

PICKINGS FROM MY NOTE-BOOK.

I. It is a mistake, traceable perhaps to the unfortunate practices of a few literary men, to suppose that there is any necessary connexion between the exertions of high intellect and sensual indulgences. On the contrary, persons who cultivate their minds are, taken as a class, abstemious of gross pleasures. It is amongst the more flourishing inhabitants of our mercantile cities, amongst men whose whole thoughts are given to business, and with whom opening a book is a rare event, that the highest examples of table-loading and wine-toping are to be found. In companies of the intellectual and refined in other cities, a few dishes are seen to suffice, and hardly a bottle will be drunk amongst half-a-dozen persons. An eminent painter in London, who had a wife and a pleasant family growing up around him, was accustomed, some years ago, to hold what were called *conversazziones* at his house. No person, male or female, was invited, unless he or she had attained some degree of eminence in literature, science, or art. There were generally seventy persons present; and for a time all felt them to be most agreeable meetings. What was remarkable, very little was eaten or drunk on these occasions. The intercourse of mind with mind appeared to be sufficient. At length it began to be said that men ought to be allowed to bring their wives, and, in the few instances where married women of literary celebrity had been admitted, that these should be allowed to bring their husbands. By and by, the wives of the literati and artists pleaded for permission to bring with them female friends who happened to be staying with them. Thus a large infusion of commonplace mortals took place. The consequence was, that the meetings fell very much off in attractiveness, *while a large increase took place in the amount of eating and drinking.* So much was the latter the case, that the host found it necessary to give up the use of wine, and finally to abandon everything like supper. But this gave the finishing-blow to his parties; for the clever people having by this time thinned off, and the ordinary finding nothing substantial to make up for that want, there was no longer anything to meet for. In short, these conversazziones, which had at first been intellectual feasts of the most delightful kind, were at last given entirely up, after they had lasted, in one form or another, about six years.

Is there anything surprising in these facts? Is it not, on the contrary, a familiar truth, that we are diverted from one set of feelings by the claims and gratifications of another? I mention the case of the conversazziones as supporting those who advocate the education of the masses, upon the ground that every sheet read is the augury of a glass the less drunk.

II. Ducrow was an eccentric, good-natured man. He used to give his people a fête at Blackwall every year. Mr ——, a brother manager, accompanied him on one occasion, and the two sat at a window in the hotel, to see the party arrive in boats. 'Ducrow, do you find your fellows at all honest?' inquired the friend. 'Oh no; but no matter for that. Some years ago I used to remark as a queer thing about them, that they were all very civil at the commencement of the season, but towards its close, used to walk past me as stiff and erect as grenadiers. I could not understand it, till, by and by, making a strict investigation, it turned out that every man, on going out of the theatre, had a plank of my wood up along his back under his clothes. There now, you see these fellows coming rowing up in their shirts? The shirts, I have no doubt, are all made out of my banners. [Banners are cotton sheets brought in, at such theatres as Ducrow's, to inform the audience, by certain inscribed legends, of circumstances necessary for them to know during the progress of the piece.] See now,' continued Ducrow—'see them raising their oars as they land, and "SHE DIES AT SUNRISE" under that fellow's arm!'

III. 'Taken as a body, practising barristers have about the least share of general information, the most contracted acquirements in general science, the most uninformed and prejudiced views on all general questions that lie *dehors* the little circle of the legal business with which they are connected, or to which their attention has been directed, of all the liberal professions.' So said the Sun newspaper of the 30th July 1845. As far as my observation extends, I think the remark a just one. Medicine furnishes vast multitudes of men of science. Even the church furnishes a considerable number of members to our scientific bodies. But it is a marvel to find a lawyer given to philosophical pursuits. The tone of the barrister mind is—sharpness, liveliness: he is a master of persiflage, and that kind of bantering exaggerative wit which is so common in our day, much to the exclusion, I fear, of all manly earnestness and deep conviction: but rarely are any of nature's mysteries, or thought's farthest reaches, touched upon in the discourse of men of the bar. It seems that they may be litterateurs—often they are—or antiquaries, but never philosophers.

IV. There are some natures of an opposive and rebounding kind, which are the better of being a little trampled on. I will illustrate this by an anecdote or two of a person now living and carrying on business in London. Let us call him Peter Smith.

Peter was originally a joiner in a small way. When the furnishing of plans for the new houses of parliament was competed for, he was prompted, by an odd ambition, to try his fortune. The only result was an article in the Times, ridiculing his presumption, and dwelling with peculiar derision on the ostentatious manner in which he had paraded his humble calling, by way of exciting the greater admiration for his plans. Smith was deeply wounded, but not cast down. By way of overcoming the bitterness of his feelings, he forced himself to get the journalist's diatribe by heart. There was something in the case which struck the fancy of William IV., then reigning; and soon after the article appeared, Peter received a visit from one of the royal equerries, commanding him to the palace. The kind-hearted monarch was so much pleased with Smith, that he gave him several commissions in his trade, and afterwards obtained for him some government employment. The foundation of a considerable business was thus laid.

The act, however, by which Peter most brightly illustrated the principle at the head of this note was as follows:—At the time when he was ambitious of distinction as an architectural designer, being twitted with not having seen any of the great buildings of the continent, he determined to travel for that purpose, though it must necessarily be under unusual difficulties, and at what was to him a great sacrifice of both time and

money. His greatest difficulty was with regard to a sickly child of his own, whom he feared to commit to any one during his absence. The resource adopted by this extraordinary man was, to build a little hand-drawn carriage for his son, with a seat at one end, and a place for baggage at the other; and he actually drew his son in this fashion over a great part of Europe, while inspecting the various buildings which he wished to see for the improvement of his taste.

Little do we think, as we gaze idly along a line of common tradesmen's signs in a London street, what heroes may be some of these Smiths and Thomsons.

V. The objection to improvements which extinguish certain kinds of employment, or interfere with 'vested interests,' is certainly carried to the extreme of its absurdity by those who have opposed the draining of the Haarlem lake, on the ground that it would take a present livelihood from a few hundred fishermen.

VI. There is no judging a man from the doctrines or opinions on abstract questions which he will be found entertaining. Some of the advocates of the more selfish theories have been practically the most benevolent men. Mr Malthus, I believe, was an instance. May it not be, that the self-assurance of the heart's kindness towards all is what allows these men to embrace the theories? If so, the converse may also be true, and selfish men may often be the loud and boisterous patrons of benevolent theories, merely to give themselves a little comfort under the unconfessed pain arising from their continual adoration of self.

VII. England is every now and then assailed by demonstrations of a pugnacious spirit on the part of France and America. Her ambitious and haughty character is inveighed against as intolerable: their sufferings from her can only be redressed by war! It is, nevertheless, an absolute fact, that England is neither ambitious nor haughty in anything like the sense in which these terms are used by France and America. As was lately acknowledged by an unusually-candid continental paper (the Augsburg Gazette), 'the English, whatever people may say, trouble themselves little about acquisitions of dominion—such acquisitions are rather made *in spite of their policy, than in consequence of it.*' This is most perfectly true. An Englishman learns at breakfast, from his newspaper, that Scinde has been added to his country, and in an hour thereafter, in his counting-room, he has forgot the circumstance. I will defy any foreigner to detect, in any department of British society, a thirst of territory or a love of military conquest: the sentiments are positively unknown. The greatness of England is in her vast material wealth—the result of an industry unparalleled, of the ingenuity which aids that industry, and the comparatively (alas, only comparatively!) liberal spirit in which it has been administered towards mankind. Then, again, England is not haughty to any other nation. The people at large feel no such sentiment, whatever a foolish minister may occasionally, and for a brief space, be allowed to say or do. Indeed the remarkable thing about England with regard to other countries is, that she never thinks about them at all. One or two of them will be fuming about her arrogance, when the simple truth is, that they have never once, one way or another, crossed her thoughts.

May not an explanation of these charges against England be found in the feelings of their authors?

We shall say that the conspicuous family of a little district is one possessing great wealth and influence, partly from inheritance, partly from the talents and successful public services of its living members. It is a case of exaltation through natural causes, and therefore, as far as our present social system is concerned, legitimate. Now, this family may be amiable and beneficent as it is possible to be; it may bear all its faculties meekly, and be really humble-minded, as far as a large share of the world's gifts will allow. These characteristics may be fully known and appreciated by those admitted to its society, as well as by the poor of its neighbourhood. And yet we know very well that another family, aspiring to the same level, but not yet near it, will be heard describing this old family as insufferably ambitious and proud; the bad spirit being not in the party accused, but in the accuser—in short, a case of simple jealousy, the oldest of human sins. Hundreds of times will we thus hear persons spoken of as setting themselves high, when we know them to be perfectly unassuming, and that the accusation is solely the effect of their position operating upon an invidious spirit in their detractors.

This is verily the case of England among such of the French and Americans as accuse her—for it would of course be absurd to say that the entire nations act in so silly a manner. And is it not deplorable, that a country of realised greatness like France, or one of promised greatness like America, should be degraded by any portion of their people betraying such paltry feelings with regard to their unoffending neighbour? If these countries are in want of an increase of dignity, will the exhibition of one of the meanest feelings of our nature help them to it? If they wish for additions to their material wealth, will the diversion of their industrious citizens into the idle and expensive fopperies of soldiering, and the exposure of their merchandise, and even perhaps their seaports, to destruction, conduce to that end? Will they be likely the sooner to attain the same level with Britain, that they provoke her to strike them for her own defence? How unutterably foolish! How unworthy of the real character which either country possesses!

RUSSIA UNDER NICHOLAS THE FIRST.*

SUCH is the title of one of the most remarkable sketches of Russia, her people and her government, with which the English public has ever been presented. In 1841, Mr Ivan Golovine, a gentleman of ancient family, quitted St Petersburg with a view of bettering his health by travel in southern Europe. The imperial will has decreed that no nobleman shall be absent from his country longer than five years; and, secure under this permission, Mr Golovine was enjoying himself in Paris, acquiring a knowledge of the people, and devoting his leisure hours to the completion of a work on political economy. Scarcely had copies of his work reached his native city, when he received orders, through the Russian charge-d'affaires, instantly to repair to St Petersburg. Neither sickness nor other excuse could be listened to; and in case of disobedience, he was to be proceeded against as a rebel to the imperial will. Mr Golovine urged, in reply, that he had been absent little more than a year; pled the state of his health, and produced the necessary medical certificates. All this was of no avail; the order of return was merely reiterated; and finally, failing to comply therewith, he had pronounced against him the penalty of banishment to Siberia, the privation of all his civil rights, and the confiscation of his property. The same, however, would have been his certain fate had he returned to Russia. His 'Political Economy' had evidently been too liberal for his native atmosphere; hence his recall, and hence the anxiety of the autocrat to punish the audacity of a youth who had ventured to say such things as might disgust the ear of kings.

Since his residence in Paris, Mr Golovine has drawn up the sketch alluded to—a sketch by no means flattering to our imperial ally, and which we may naturally expect to be tainted with the bitterness of an ill-used and expatriated man. But no: 'If I have spoken ill

* Russia under the Autocrat, Nicholas the First. By Ivan Golovine, a Russian Subject. London: Colburn. 1846.

of Russia, it arises solely from the affection which I bear her. We look with comparative indifference upon those faults in a stranger which offend us in our own brethren; and we are more rigid towards those we love, than those in whom we take but little interest. Independently of this, I regard Russia as an abstract idea—great and beautiful, which I delight to elevate in my dreams of futurity.' This is just and honourable; and with such views, our author in exile will be of more use to his country than if he had dwelt in the heart of her capital. There, every original and liberal thought would have been suppressed by an iniquitous censorship; here, he may write as he thinks, and the closest cordon of custom-houses will not prevent these thoughts from reaching his own party at home. Passing over much that he has written respecting the self-will and cruelty of the emperor, the venality of the police, the sycophancy of the courtiers and judges, the anomalous state of the law, and the nature of the public service, which may be said to absorb the life and soul of the nation, we shall now advert to the portraiture which he presents of the character and habits of the people.

Mr Golovine admits that there is not a more complex, more embarrassing, and more ungrateful task, than that of drawing the character of any people. More especially is this the case with a nation like Russia, which is compounded of so many races, and where the social state is eminently one of transition. Nevertheless, there are several broad features peculiar to the Russian nation, and these he describes with no 'bated breath or whispering humbleness.' Admitting that the Russ is naturally good and mild, more so than other nations, and that he still retains something of his primitive barbarism, as he has already borrowed some of the defects of modern civilisation, our author declares his countrymen to be the most arrant and adept cheats in creation. 'Not finding a worthy and sufficient occupation for his mind, the Russian turns his attention to fraud, which he considers as an easy means of rising in the world. This is an effect of the want of civilisation, and the fruit of slavery. Not feeling his strength, or not daring to make use of it, he has recourse, in most instances, to craft. This is also a proof of his misery; not knowing any remedy for his sufferings, and unable to escape the evils which overwhelm him, he is more liable than another to fall into fatal derelictions; such as cheating, drunkenness, and general debauchery. Cheating, indeed, is carried to such excess in Russia, that one might be tempted to say it is in the air or in the blood. Russian commerce and manufactures are, unquestionably, the most dishonest in the world. China and England have had equal reason to complain of it. The Chinese, who are too suspicious to receive, without examination, the rolls of Russian cloth, find pieces of wood inside; the English receive grease instead of tallow. Their government has in vain repeatedly protested against these abuses, and the emperor has in vain issued decrees to suppress them. A Frenchman, who was appointed by the government to unmask all this fraud, was well-nigh killed by the manufacturers; and the officers have evidently not been proof against the seductions which he resisted, for his denunciations have had no effect. The petty shopkeepers live only by plunder: you purchase an article in a shop, and take a different one home with you: you must be always on your guard. All servants are notorious thieves, especially the cooks and coachmen. It may be pretty much the same everywhere, yet it is never carried to such excess as in Russia. There the officers, even of the public administrations, seize eagerly with both hands; they do not wait till you give them something, but they beg and bargain with you—accept large presents, and do not disdain the most trifling.' With all this overreaching and cheating, the Russian is represented as pious, hospitable, and generous—qualities which are common to primitive nations, and which civilisation unfortunately tends to weaken. His piety, however, is closely allied to superstition, and consists almost entirely in the scrupulous observance of religious forms. 'I have seen,' says Mr Golovine, 'a thief pick the pocket of a passenger with one hand, and with the other make the sign of the cross at the sound of the vesper bell.'

Another vice exceedingly common in Russia is that of drunkenness. 'This may be traced to various causes: such as poverty, despair arising from the precarious state of things, the want of security for property, the uncertainty of the future, and, above all, the lack of education. Time and the government may do much to remedy these evils: the first by enlightening the masses, and the second by seeking more honourable sources of revenue than the distilleries, of which it retains the monopoly, by making itself the first tavern-keeper in the country.' Allied to this propensity is the Russian's nonchalance and carelessness, which are perfectly Asiatic. He has naturally great strength, both of body and mind; can readily endure fatigue and privation; and might soon rise superior to most nations, if his moral were equal to his physical abilities; but he works by fits and starts, and his idleness is one of the chief obstacles to the development of the powers of his country. Though idle, he is ambitious—a condition forced upon him by the political organisation of the empire; but as the nature of the government at the same time paralyses his zeal, and represses the exercise of his capacity, 'there is no country where there are so many instances of persons who have failed in their career, or been disappointed in their ambitious projects, or where discontent, unable to find vent in legitimate and open opposition, terminates in melancholy apathy or inevitable ruin.'

As every hope and ambition of rising in the public service must necessarily centre in the emperor, whose nod can make or unmake fortunes, a great body of the population must be ever fawning, flattering, and cringing, if not directly to the czar himself, at least indirectly through his courtiers. 'Next to the king of heaven,' says Mr Golovine, 'the czar is the object of the adoration of the Russian. He is, in his estimation, the representative and the elect of God, as he is the head of his church, the source of all the beatitudes, and the first cause of all fear. His hand distributes as bounteously as his arm strikes heavily. Love, fear, and humble respect, are blended in this deification of the monarch, which most frequently serves only to mask the cupidity of some and the pusillanimity of others. The czar is the centre of all the rays—the focus to which every eye is directed: he is the *red sun* of the Russians, for they thus designate him; while they call the vestibule of the Kremlin, where the ancient czars showed themselves to the people, the Red Vestibule—*Krasnoïé Kryltzo*. In public, every eye is directed towards the emperor; in the drawing-room, the conversation turns solely upon him and his family; even in private, men's thoughts are chiefly engaged about him. All that he does is well done, and worthy of imitation; everybody walks in the promenades at the time that he walks; everybody loves dancing, because he is fond of it; and there is no person who does not admire the military service, because the emperor is a zealous advocate for it. The czar is the father of the whole nation, and no one has any relation who can be named in the same day with the emperor. When his interest speaks, every other voice is hushed.

'The relations of the conspirators of 1825 were dancing while those unfortunate men were made to pass through the city; and it is difficult to say whether the mother, who accepted 300 rubles as a reward for having given up her son, who was a deserter, or the emperor, who gave them to her, acted the most like a Spartan. There is abundance of liberalism with closed doors: but stones are thrown at him who revolts, and a liberal who is compromised is shunned like a leper. Those men who at different times have sacrificed themselves for the public good, have reaped more indifference and hatred than sympathy. Instances are not wanting of relatives who have abandoned their sons and brothers in Siberia without an attempt to save them, and

then enjoyed the property to which they had become the heirs by their condemnation; nay, and who afterwards were reluctant even to carry on a correspondence with them; and whose unfeeling conduct has been the severest part of the fate of these poor sufferers.' Again—'Nobody in Russia dares to differ in opinion from the emperor, even on the most trifling subject; on a question of art or of literature. When he has once given his opinion, nothing remains but to accede to it, or to remain silent. I one day asked a journalist if he would give a review of the History of M. Buturlin, adjutant-general to the emperor? He answered with much simplicity, "I have not got two heads upon my shoulders."'

This is a gloomy and distressing picture, streaked, however, with the hope that matters will some day or other be righted, though that day in Russia seems yet far distant. 'The great majority of Russian liberals are merely malcontents; and thanks to the fatal conviction, that an absolute government is the only government which is at present adapted to their country, enlightened men contrive to live at peace with their conscience. They will not understand, that even if it were so, it is the sacred duty of an honest man to contribute, to the utmost of his power, to the spread of civilisation, and to hasten the order of things from which it necessarily flows; for if a free government be an effect of civilisation, it is likewise a cause of it, and I believe that we might as well begin with the one as with the other. Russia is a land of serfs and men in office; the virtues which accompany or flow from liberty are unknown here. It is the government which makes the Russian what he is, and which ought to bear the responsibility of all his defects. It is to the government, much more than to the character of the Russians, that we must attribute the hatred which is felt towards them as a nation; and this hatred is so strong, so general in foreign parts, that I have met with some of my fellow-countrymen who did not dare to confess to what nation they belonged.'

Though thus politically degraded, the Russians are by no means a dull and stupid people. Manual skill is a talent peculiar to them, and the meanest serf possesses the faculty of imitation in an eminent degree. Imitation is no doubt a very subordinate faculty compared with that of invention; but the character of the government is repressive of originality; and not till scope and encouragement is afforded, need we expect the development of the higher powers which the Russian intellect may possess. 'In point of intelligence, as well as in the general traits of character, the Russian holds the middle place between the Frenchman and the German: he has, at times, the profoundness of the one and the brilliancy of the other. He is less phlegmatic than the German, and less sparkling than the Frenchman; more practical than the former, less inconstant than the latter; and less a slave to routine than either. Russian, or rather Sclavonian intellect, unites in itself both these elements, and conciliates the two characters. I am not one of those who think that he has the vocation to regenerate the world, for I do not believe the world is disorganising and approaching its destruction; but I am of opinion that he is destined to reconcile the French and German intellects, to complete the one by the other, to blend and combine both, and in time, perhaps, to extend the sphere of their action.'

Thus much for their mental characteristics, now for a glimpse at the kind of life they enjoy. 'The Russian is very sedentary, for the climate compels him to be so, and his manners are in consequence as indolent as those of the Oriental. He prefers lying down to standing, and riding in a carriage to walking on foot. Idleness is a general defect of the nation. An equipage is an article of the first necessity; fashion prescribes it as a law; and the great distances to be traversed in the towns, render it almost indispensable; while the cheapness of horses and of forage, and the facilities which the nobles have of taking their coachmen from among their serfs, make it very inexpensive to keep a carriage. Accordingly, there is no gentleman, however small his fortune, who does not sport a carriage; and no wretch, however poor, who cannot boast of a vehicle. The number of carriages on the public roads is therefore positively countless; but for that very reason, they are seldom worth looking at. The horses are scarcely ever well-matched; and certainly the Russian coach-makers cannot yet rival their foreign neighbours.'

In domestic comforts the Russians are rather deficient: cleanliness is not one of their special virtues; carpets and chimneys are luxuries which are not yet general; and the overwhelming number of ill-fed, ill-clad domestics, contributes to the filth and confusion, rather than to the good order, of an establishment. Generally speaking, the people live well; but their cookery is of the most indigestible nature. Soups, gruel, and cakes, are the staple dishes; and the meals are numerous and sumptuous. Tea is a favourite beverage, and many people drink it all day long. Smoking is universal; and some young gentlemen carry the mania so far as to have special valets for filling and lighting their pipes. The consumption of champagne is immense. 'It is said that more champagne is drunk in Russia than in France; and the Russian infant learns the name of cliquot at the same time as the words father and mother.' Though vapour-baths are almost universal, the use of linen, according to our author, is not so general as could be desired, and even when used, it is for the most part changed as a hebdomadal luxury.

The Russians are rather sparing in their amusements, if we except the numerous holidays imposed by the national church. Cards are the usual resource of an evening party; dancing and conversation are held in subordinate favour. The manly sports of hunting and fishing are little practised, considering the ample resources of the country; and thus the life of the Russian landowner is one of monotony and insipidity. In winter, country life is quite insupportable; and everybody in tolerable circumstances 'goes up' to Moscow, or at least to the capital of his province, where he has the resource of clubs, of some balls given by the nobility, and of gambling. The artificial ice-mountains afford a never-ending diversion in the depth of winter, and when ice is not procurable, they are made of wood.

According to our author, 'the life of the merchant is very different from that of the nobleman. He plays at draughts instead of cards, rides in a car instead of a chariot, and has the liberty to wear a long beard—an ornament which no nobleman is permitted to indulge in. He is faithful to the Russian cookery, drinks his champagne, and sips his tea in the saucer instead of the cup. He employs his superfluous wealth in ornamenting the images of his patron saint, and in adorning his wife—the whole in the worst taste imaginable. His children have nothing more at heart than to throw aside the national costume, and to dress like *petits maîtres*.' Of the life of the peasant Mr Golovine gives a more cheerful picture than we would have expected; but it must be remembered that it is a happiness that knows no better condition than that of serfdom—the privilege to eat of the bread of another whose will he must obey.

Poor and uncivilised as we are apt to regard Russia, her people are most extravagant and reckless in their habits—literally letting the morrow care for itself. Economy is a thing unknown among the higher classes; 'it is even considered fashionable, and a mark of good-breeding, to get into debt, and to send the creditors about their business if they venture to apply for their due. The public service creates a kind of right in this respect, by securing the military and civil officers against certain legal annoyances; and, accordingly, there is no country in the world where it is more difficult to get paid, and where credit is less extended.'

Such is a brief outline of Russian character by one who is evidently too much of a patriot to misrepresent his country. His protraiture of the government and public institutions is equally vivid and instructive; but

our limits forbid further extract. We cannot close, however, without expressing a hope that Mr Golovine will continue the same course of delineation and exposure. The first step to remedy abuse, is to expose it: in his own words—'Men are much more easily corrected of their faults when they have been obliged to blush for them, than when they have only had to suffer for them. Publicity is the salvation of the world, and would be that of Russia, if it were suffered to penetrate there.'

FIFTEEN YEARS OF DIFFERENCE.

A TALE FROM THE FRENCH.

In a tastefully-fitted-up drawing-room, from the half-open windows of which could be seen the dim alleys of a park full of magnificent shades, two ladies were occupied in those delicate labours which, while they appear to employ only the fingers, serve also to abstract the mind agreeably from surrounding objects, and even afford an easier flow to the thoughts. One of these ladies, whether by chance or on purpose, was seated before a mirror, and she could not raise her eyes from her work without there perceiving her reflection, adorned with all the lustre of a beauty of seventeen, worthy to serve as a model to sculptors and painters. Glossy black hair, in which art so well seconded nature, that it was difficult to say to which of them she was most indebted for its elegance, relieved the whiteness of her neck and face; and I would add, if I were permitted to use that antiquated expression, that the freshest rose alone could be compared to the colour of her cheeks and lips. A person formed in the most graceful proportions supported that charming head, and whatever youth could borrow from the art of the toilet, had been employed to increase still more such enchanting loveliness. Half hid by the rich drapery of the casement near which she had placed herself, to obtain a more favourable light, the other lady was working, without any distraction of thought: a certain degree of gravity was visible in her manner of dressing, in her carriage, and even in her face. Her eyes were fine, but calm in their expression; her smile was affable, but momentary; the brilliant colours of youth were no longer seen on her cheeks, which were now become less round, so as to leave only an undecided shade, augmented occasionally by a quick and transient emotion, a good deal resembling the meteors with which the clouds are streaked in the stormy nights of summer. Gauze and ribbons, with which youth delights to decorate itself, were not in her case mere ornaments; she made use of them to conceal tastefully the effects each succeeding year had gradually made upon her; and her ingenious head-dress was so arranged as to hide at the same time a few silvery hairs which had dared to mix themselves prematurely with her long and fair tresses.

'What detestable silk!' said the younger of the two, throwing down her work upon an ottoman; 'I shan't do another stitch to-day.' So saying she rose, and approaching the mirror, amused herself in arranging the curls of her hair.

'You have no patience, Léopoldine,' replied the other lady, turning to her with a kind look; 'that is just the way to succeed in nothing. One must have patience as much to conduct herself properly in the world as to finish a purse.'

'I know it, for the matter of that,' said her sister smiling; 'do you forget that a certain person has undertaken to teach it me? Ten purses, like the one I am embroidering, would not tire me so much as M. de Berville's silence. Can you imagine what is keeping him?' added she, while going to seat herself beside her sister—'for, in short, he loves me, that is certain; and he has now nothing more to do than confess it to my Aunt Dorothea.'

'That is very like presumption,' returned the elder lady, 'and you are not right in saying so; but what does it matter to you what he thinks? I trust your happiness does not depend upon him?'

'My happiness? Certainly not: but still, Stéphanie, he is a suitable match; and if he would only explain himself——'

'It would then be time to think of it. Until that event, Léopoldine, I would advise you to see in M. de Berville only an esteemed friend of our family—an amiable man, whose society does us honour. A young girl should never be anxious to deliver up her heart, especially to one who does not ask her for it.'

'Oh, do not be alarmed; I intend taking good care of mine: the lot of a heroine of romance tempts me but little; but for all that, I should be unwilling to become an old maid.'

At these words, which Léopoldine had thoughtlessly spoken, Stéphanie's face flushed suddenly, and for an instant it shone with as much radiance as that of her younger sister.

'There is even a worse condition than that,' she replied with a slight emotion; 'it is to contract an ill-assorted union.'

'Indeed, my dear sister, I did not mean to offend you,' replied the young lady in an embarrassed manner; 'but the world is so strange—you know it yourself; besides, I do not understand why you have remained single?'

'Suppose nobody asked me in marriage?' said Stéphanie smiling.

'What! really? Is it possible?'

'Indeed it is. However, I believe that circumstance is rare enough, and I grant that I have found many opportunities of getting married, but never in a suitable manner.'

'You were perhaps difficult to please?'

'I do not think so; but when very young, about your own age, I was courted by a man to whom fortune alone was wanting, or at least the means of maintaining a position in society. Our parents, not being then in possession of the rich inheritance they have acquired since your birth, refused him my hand, from a motive which I appreciated afterwards, but which at the time almost broke my heart. From this opposition to my inclination, a total indifference to marriage took possession of my youthful feelings. I only looked for a husband after my own heart; and not finding one, I was resigned to becoming an old maid, thinking it easier to bear the unjust remarks of meddling persons, than to endure a heavy and burdensome yoke even to the grave.'

'Do you not feel regret sometimes?'

'No, Léopoldine, that condition which frightens you has its advantages like other positions in life. I adopted a certain course relative to the wound my self-esteem had suffered, and called into my assistance literature and the fine arts, which it is so difficult for married women to cultivate, without interfering with their duties; and when, after the death of our parents, I found myself left in charge of your youth, conjointly with our worthy aunt, my liberty became dearer to me, for, had I been a wife and a mother, I could not have devoted myself to you as I have done. Was I not right in remaining single?'

'To tell the truth, Stéphanie, I would rather be ill-married than not married at all.'

'Your persistency, my child, gives me pain,' replied the elder sister; 'and I should willingly think that you speak thus from want of reflection.'

While she was yet speaking, a lady, advanced in years, aunt to the two sisters, entered the room where they were sitting with a parasol, which she used like a staff, in her hand. She sat down on a large sofa of blue velvet, and rested her feet upon a stool covered with similar stuff, which Léopoldine put before her, and looking complacently on her nieces, she said—'They tell me that M. de Berville is at the end of the avenue; for which of your sakes does he honour us so frequently with his visits? For my part, I do not understand the matter; and the more I see of him, the less I can fathom his intentions.'

'You jest surely, aunt?' said Stéphanie; 'there can be no doubt about his choice: it is like hesitating between a mother and her daughter.'

'Notwithstanding that, he does not explain himself,' said the aunt; 'and it is useless for you to call yourself old, my dear niece, since I see in you a very young person as compared with myself.'

'You forget, aunt,' replied Léopoldine quickly, 'that M. de Berville is, at most, of the same age as my sister. If merit alone were what he looked for, I should have cause to dread in her a dangerous rival; but that amiable person is without any pretensions whatever: she knows that youthfulness, although perhaps trifling, has a powerful advantage over——'

'My dear, do not trust too much to that youthfulness, nor even to the beauty which accompanies it. I have seen strange things in my time; and a man capable of holding himself neutral so long, is not of a disposition to be captivated by a ribbon, or a bouquet of flowers prettily arranged.'

An incredulous smile played on the lips of Léopoldine, who was about to say something in reply in accordance with this smile, when M. de Berville was announced. Although already of an age somewhat too mature for a very young person, his dignified and elegant manners, his handsome figure, his cultivated mind, his reputation as a man of honour, and the state of his fortune, conspired to make him a match that no young lady would have thought unworthy of her; and we have already seen how favourably-disposed towards him Léopoldine's opinion was. Stéphanie thought of him exactly as her sister did; perhaps, from being in a better situation for appreciating the estimable character of M. de Berville, she did him even more justice; but still she only received him as a mother would do, who reckons on meeting the protector of her daughter, and endeavours, by innocent means, to make her secretly-conceived plans of happiness successful. The old aunt, proud of her skill in such matters, was meanwhile observing the actors of this scene, eager to penetrate, without their remarking it, into their inmost thoughts. As for Léopoldine, the veil of modesty under which she was covered could scarcely conceal the joy a coquette feels at the triumph of her charms. However, her joy and triumph received some check, for she did not appear, during M. de Berville's visit, to occupy exclusively his attention, as she expected. The conversation took a serious and instructive turn, very much opposed to the light-hearted taste of the younger lady. They spoke of science, of art, and of literature; and we know that Stéphanie made a pleasant relaxation of these, and that she took an interest in them, not for the purpose of shining, but to charm away her leisure moments. Such a conversation, therefore, was well calculated to show off her mind and her accomplishments to advantage; and she was led into it with a very natural feeling of pleasure; while Madame Dorothea saw that M. de Berville took even more delight in it than her niece.

Proud of her youth and beauty, Léopoldine had disdained to be instructed, neglecting, like a spoiled child, the lessons of her masters and the suggestions of her sister. Music and dancing were the only arts she could be prevailed on to study, because they were necessary to make her figure in the world. Incapable of mixing in the interesting conversation which was sustained, weariness took hold of her agreeable person, and ill-humour of her mind, and, in spite of all her efforts, ill-concealed yawns threatened every moment to betray her. M. de Berville, quite absorbed in the pleasure that he felt, did not observe them; but Stéphanie, guessing the cause of her sister's uneasiness, adroitly turned the conversation to the subject of music, and begged Léopoldine to be seated at her piano. She knew that her sister's voice was much admired by M. de Berville, and thought by this means his attention might be brought back to her; but the old aunt believed she could observe that he needed all his politeness to hide the annoyance which this interruption caused him; and Stéphanie herself thought the compliments he addressed to the fair singer were extremely cold.

Botany is a science perfectly suited to ladies residing in the country, inasmuch as it is a source of ingenious discoveries, and of pure and quiet enjoyment; and under the shade of trees, upon the green grass, on the brink of waters, or on the surface of the fertile soil, are its delightful lessons inscribed. M. de Berville was fond of this study, and he wished to teach it to the two sisters; who accepted his offer—the one from taste, and the other through coquetry; for in this proposal Léopoldine saw only an opportunity of displaying her grace and agility in running here and She imper the grass to collect the necessary flowers. there ovosed one condition, however, upon the arrangement; namely, that they should only go out in the morning and evening, so as not to expose her complexion to the heat of the sun. Stéphanie approved of this precaution; for the care that a woman employs to preserve her advantages has nothing blameable in it, and she was the first to show her sister the example; but, nevertheless, more than once did her desire to possess a rare or curious flower overcome her fear of being a little sunburnt; whereas Léopoldine, entirely the slave of her beauty, enjoyed no pleasure without restraint. One particular instance will serve to show to what extent she was capable of sacrificing everything to her foolish vanity.

A burning heat was consuming the face of nature; the drooping plants were bent towards the earth; the birds were silent in the depths of the woods; and the grasshopper alone, with his cherup, was heard to break the silence of creation. The reaper, bathed in sweat, slept at full length on his sheaf; the traveller, too, was waiting in sweet repose on the banks of a shady stream for the time when the descending sun would permit him to continue his journey.

In an apartment where twilight was scarcely admitted, round a table covered with plants, Stéphanie and Léopoldine were listening to M. de Berville, who was explaining to them the ingenious system of Linnæus, and the simpler one of Tournefort, when a letter was brought in to Madame Dorothea, who was employed in reading a newspaper.

'Here is sad news,' said she to her nieces; 'our excellent neighbour Madame Revel has had a terrible fall, and it is feared she has broken her leg.'

'Good gracious, how accidents do happen!' exclaimed Léopoldine. 'Yesterday, too, she was so well. But we shall go and see her to-morrow; shall we not, Stéphanie?'

'This very day, Léopoldine. You know she never deferred for a moment the consolation which depended on her presence.'

'Very well; to-night, then, after sunset.'

'No, no, let us go immediately; we will spend the rest of the day with her; and M. de Berville will excuse our absence?'

'Impossible!' said Léopoldine; 'go out in the present intolerable heat? We should certainly get a *coup-de-soleil*, which would darken our skin all the summer.'

'Under the shelter of a veil or a parasol?'

'I should not think myself safe at the bottom of a well; and nothing in the world would make me venture out of the house before nightfall.'

'You forget, Léopoldine, with what courage Madame Revel set out, alone and on foot, in the middle of a December night, in spite of the cold and snow, to come and tend you in the measles, because she heard that you cried earnestly for her.'

'I had rather expose myself to the north wind itself than to the rays of the sun.'

'Indeed, Léopoldine,' said her sister, 'heat would no more have prevented her than cold.'

'Nothing is so frightful as a sunburnt complexion.'

'If I were to become like an African, I should not leave our friend without consolation at such a time. I am going with the waiting-maid to visit her, and you

will be sorry afterwards if you do not follow my example.'

'Allow me to accompany you, Mademoiselle Stéphanie,' said M. de Berville to her, at the same time taking up his hat.

'In truth,' said Stéphanie, 'I know not if I ought to consent to your proposal; an hour's walk in this heat——'

'I am not more afraid than you are of the effects of the sun,' he interrupted; 'and perhaps the assistance of my arm might not be without service to you.'

Léopoldine permitted them to depart, notwithstanding that her conscience reproached her for it. She remained, sad and humiliated, thinking that M. de Berville ought to have joined her in keeping back her sister, whom she secretly accused, for the first time, of doing a good deed at her expense. Very soon, too, Madame Dorothea added to her discontent, by making observations which the young lady was far from expecting.

'You need count no longer on M. de Berville,' said she; 'for certainly the more I watch him, the more convinced I am he never thinks of marrying you.'

'With all the respect which I owe to your sagacity, aunt,' replied Léopoldine in a displeased tone, 'allow me to differ from your opinion. The assiduous attentions of M. de Berville must have some object in view, and that object cannot be doubtful. If he does not show any anxiety to make it known, it is because, as my sister says, he is studying me. I have, I think, no ground for alarm.

'And what if he were thinking of your sister all the time?'

'She is well worth the trouble, I am sure,' exclaimed the young girl, bursting into a laugh; 'a woman of two-and-thirty, with gray hair and wrinkles—for she has some round her eyes, as I have distinctly seen; one, in short, who might pass for my mother—what an idea! But I see what has made you conceive it for a moment: it is this mid-day promenade—a simple act of politeness, which M. de Berville is vexed at in his heart.'

'No, no; that idea has no weight except from what has passed before. I agree with you, my dear niece, that there are between you and your sister fifteen years of difference, and that is certainly a great deal. You dazzle at first sight, while she is scarcely noticed; and M. de Berville has been at first taken by your attractions; but if I mistake not, it is no longer these graces which retain him here. You have been like the taper that conducts one to a brilliantly-illuminated apartment, which makes the light seem dim beside it. I beg pardon for the comparison.'

'That is to say, that by me he has been attracted to my sister, and that by her I am now eclipsed?'

'She does not eclipse you either in youth or beauty; but her wit, her accomplishments, and the qualities of her mind, appear perhaps to be advantages sufficiently desirable to make amends for those she is deficient in; and I should not be surprised if M. de Berville has taken a fancy to her, and were to marry her in spite of her age of thirty-two.'

'If he were fool enough to prefer my sister to me, I—— But it is impossible,' added Léopoldine, casting her eyes on the mirror.

Notwithstanding, however, the flattering opinion she had of herself, a feeling of jealousy found its way into her heart, and she examined her sister and M. de Berville more closely on their return. The accident which had befallen Madame Revel proved less severe than was at first supposed. Her leg was not broken; but, in spite of the satisfaction this gave her, Stéphanie's usually calm demeanour now appeared agitated, and the two sisters were hardly left alone, when Léopoldine asked her what was the cause of it.

'I feel—I confess to you,' said Stéphanie, 'a degree of surprise, mixed with regret; for M. de Berville, whom I so sincerely wished to see become your husband, and who seemed to have no object in view but you, has——'

'Well, Stéphanie?'

'He has asked my hand in marriage.'

'I do not see anything to grieve at in that,' replied Léopoldine, trying to hide her own disappointment; 'but if he prefer old maids, he could not make choice of me.'

'What is subject of regret,' said Stéphanie, 'is, that this rivalry, as little wished for as foreseen, will alienate your affection from me, since even now you are addressing bitter words to me;' and here her face was suffused with tears.

On seeing this, Léopoldine, more giddy than wanting in feeling, was recalled to a sense of her injustice to her sister, and throwing herself into her arms, said, 'Forgive me, my dear sister; I see very well it is not your fault; but confess that the result is very humiliating to me, who was the original object of his attentions. That man is fickle, and an impostor.'

'No, Léopoldine, he is only reasonable. Tempted by the advantages you have received from nature, he hoped to find also in you those you might have acquired, had you been persuaded by me. Your ignorance, your coquetry, and the absurd importance you attach to beauty, have convinced him that you would not have been happy together. And not with him alone,' continued Stéphanie, 'unless you resolve to think little of qualities of short duration, which disease quickly destroys, and which time, in its progress, is every day depriving you of. A young girl, whether she is handsome or ugly, ought never to neglect to adorn her mind, to ripen her understanding, and to form the affections of her heart. What has that beauty availed you to which you trusted so much, and to which you have even sacrificed the duties of friendship? A person who is neither young nor good-looking, has, in spite of herself, carried off your conquest; and merely because she never thought about the matter. Profit by this lesson, and make good use of your years of youth to come to be instructed and corrected. There will present himself, I trust, another De Berville, who, attracted like the first by your external graces, will find, on more closely inspecting you, that your good qualities even surpass them.'

Léopoldine yielded to persuasion, and followed this advice with readiness, of which she soon reaped the benefit. Stéphanie having become Madame de Berville, continued to be as a mother to her sister until she was married. The anxieties and troubles inseparable from maternity very soon effaced the rare beauty of Léopoldine; but she had still so many amiable qualities remaining, so many solid virtues, so many mental graces, that its absence was little observed; and the young wife was neither less beloved nor less endeared to her family by its loss.

PROFESSOR FARADAY'S LECTURE ON LIGHT AND MAGNETISM.

The recent important discoveries by Professor Faraday in the interesting branches of natural philosophy specified above, were, a few weeks since, made the subject of popular elucidation and experiment in a lecture delivered by him at the Royal Institution in London. The subject is one to which the attention of the lecturer has long been directed; and he was led to believe, from certain philosophical considerations, that an intimate relation would be found to exist between the various results arising from the operation of the powers of nature on matter—which, possessing a common origin, are mutually dependent on each other, and may, in certain conditions, be converted the one into the other. This reciprocal convertibility has already been demonstrated by electricity and magnetism; and it was supposed that light would eventually prove to be connected with the same class of phenomena. Mr Faraday's anticipations were realised; and, after numerous searching investigations, he arrived at the discovery which we are about to describe, 'that a ray of light may

be electrified and magnetised, and that magnetic lines of force may be rendered luminous.'

The lecturer commenced by observing that he feared his auditory would be disappointed in their expectations of entertainment or instruction: he appealed to their love of knowledge, their desire to penetrate the mysteries of nature, as his experiments would tend to the development of a principle, rather than to the exhibition of showy results. While apologising to the philosophical portion of his hearers for what might be termed a 'juvenile lecture,' he stated his object to be the making plain of first principles—to give a simple expression to some of the more elaborate scientific investigations; and trusted that both parties, the learned and the unlearned, would show themselves indulgent in case of failure.

On the table, in front of the lecturer, lay an immense horse-shoe magnet, several inches thick, and nearly two feet in length. At one end stood a hollow helix of large dimensions, made of closely-twisted copper-wire, connected by wires with the horse-shoe, and with a Grove's battery placed on the floor. On a sloping stand was a lamp, resembling in general appearance those used for magic lanterns, the light from which, passing upwards across the table near to the poles of the magnet, fell on a white screen at the back of the operator. Various glass tubes, some of which were filled with liquid, two or three short thick pieces of iron, and a quantity of nails, completed the apparatus.

The room being darkened, Mr Faraday explained what was meant by a ray, by throwing a stream of light from the circular aperture of the lamp to the screen, and bending it to various parts of the room. A common ray, however, affords but little assistance to the object of the experiment, which requires polarised light. This phenomenon, which the lecturer could not stop to explain, further than as consisting of a ray with *sides*, may be familiarly described by supposing a long square piece of wood to represent a ray of light; two of its sides, opposite to each other, are painted green, and possess a certain property; the other two sides, possessing a different property, are painted red. This polarised ray would be again unpolarised if all the sides were alike.

With unpolarised light, reflection takes place in all circumstances; but with polarised, only under certain conditions, as two of its sides may fall on a reflecting surface, and be there lost, while the other two will be reflected. And it is to be remarked, that this property is not peculiar to the whole ray only, but is equally possessed by each of its individual filaments.

There are many substances which possess the power of polarisation; among them are transparent carbonate of lime, or Iceland spar, glass, the air, sugar, oil of lemons, oil of turpentine, black marble, ebony, and some varnishes. When a ray strikes upon a piece of the spar, or on quartz, it divides—one portion continuing its straight direction, while the other goes off at an angle, and two distinct images are seen on the place where it ultimately falls. Light may also be polarised by reflection from a transparent mirror, or by passing through a pile or 'bundle' of plates of common glass, as shown by Mr Faraday in pursuing his illustration, when the image on the screen, which had hitherto been circular, became immediately square. On placing a piece of quartz to intercept the ray in its passage from the pile of glass plates, two images were seen—one green, the other red; these, on turning round the reflecting surface, changed their position, becoming reciprocally green and red as they revolved one around the other.

In addition to this remarkable property of colouring a ray, quartz has the power of turning round or diverting the beam of light from its course. A ray being thrown on the screen, was intercepted in its line of direction by 'the analyser;' a Nichol's prism, which, formed of two pieces of glass cemented together with Canada balsam, possesses the power of throwing the light entirely out of the field of vision. But on placing a piece of quartz between the lamp and the analyser, the ray was again visible on the screen, having been turned round and restored to its place by the intervening substance. This phenomenon, which for a long time has puzzled philosophers, is known as circular polarisation.

After this illustration of natural agency, the lecturer proceeded to show the effects of magnetic force. The gentlemen seated near him were cautioned to guard their watches from the disturbing influence of the vast power at his command; and a communication being established between the battery and the helix beforementioned, a heavy needle standing near was seen to vibrate rapidly, and leap, as it were, into the direction of the current. The addition, however, of iron to the helix, increases its power to an almost incredible degree. A bar was passed through the central hollow along its whole length, when the needle, though at a greater distance than before, was violently attracted towards it. An iron weight of fifty-six pounds hung to the lower side of the bar by the mere contact of its ring, and required considerable force to separate it. One of the short thick pieces of iron, about twelve inches in length, and three in diameter, on being presented to the end of the bar, remained fixed in a horizontal position, and bore several blows of the lecturer's hand without separating, while it became so highly magnetised as almost to support a similar piece at its outer extremity. Mr Faraday explained that the action of the magnetic force is not impeded by bodies placed in its line of direction. 'If,' said he, 'I stand in the way, it passes through me without losing any of its effect.' It will also pass through a wall into an adjoining apartment. In illustration of this, the under side of an earthenware plate was held vertically against the end of the bar projecting from the helix, when, on throwing a handful of nails against the opposite side of the plate, it was held without falling by the magnetic attraction alone, while more nails were added to the first, where they clung, a heavy mass of bristling iron. The helix was then taken from its stand, and laid across the table; a large board, covered with sheets of white paper, was placed upon it, and the nails were scattered, without any regard to order, over its surface. On establishing the circuit between the helix and the battery, a sudden click was heard, and the nails were seen to arrange themselves in certain directions, more or less influenced by the magnetic current. But on striking the board at one corner, so as to produce a slight vibration, the nails ranged themselves in regular curved lines, radiating from two centres corresponding with the poles of the helix. These magnetic curves, as the lecturer explained, exist not only horizontally, as shown by the surface of the board, but are carried through the atmosphere in all directions between the poles. If the nails could have been made to stand one upon the other, the curves or arches would have been seen springing from and bestriding the board.

The helix being replaced on its stand, was brought into communication with the horse-shoe magnet by wires, when Mr Faraday stated that the extraordinary power, whose effects had just been demonstrated, was increased tenfold. The substance best adapted for the exhibition of the relation between light and magnetism is silicated borate of lead, commonly known among opticians as 'heavy glass;' a piece of this, which the lecturer terms the *diamagnetic*, was placed in the line of the polarised ray issuing from the lamp, being, at the same time, in the line of magnetic force passing from one pole to the other of the horse-shoe; which line of force, it has been found, is able to affect a ray on its passage through a transparent substance. The light, on leaving the piece of glass, fell on the screen, from which it was diverted, as in the previous experiments, by the interposition of the analyser. But as soon as communication was established with the battery, the ray re-appeared on the screen, and was again lost on the interruption of the circuit. When the magnetic influence is passing from the south pole, the ray turns from left to right, or the contrary on reversing the poles. By continuing these changes, and reproducing the effects, the complete success of the experiment was satisfactorily established.

The discovery thus resolves itself into the simple fact, that a ray of light may be made to rotate by the force of magnetism in the same manner as by quartz or other crys-

talline substances. Many persons, however, object to recognise it as a discovery, on the ground that the phenomenon is not new. To these Mr Faraday replied by observing, that when two persons look at the same time into opposite ends of a tube filled with oil of turpentine, the ray appears to each of them to turn to the *right;* but on looking into a tube at a magnetised ray, if it be seen turning to the right at one end, the motion will be the same through the whole length of the tube; so that, to a person at the opposite end, it will appear turned to the left. This was the first occasion of showing the experiment to a large number of persons at one time; it had previously been seen only by individual observers gazing through an eye-piece, and much ingenuity was displayed in the arrangements for exhibiting the whole series of experiments in the clearest and most comprehensible manner.

It may be said, this result of so much scientific labour and investigation is apparently of very little importance. It is, however, impossible to foresee what great consequences may arise from the first small and isolated fact. Dr Franklin was at Paris when balloons were first invented: a gentleman sneeringly inquired in his presence, 'Of what use are balloons?' 'Of what use,' replied the doctor, 'is a new-born child?' Mr Faraday remarked, in concluding his lecture, 'Although our experiments may be small as to facts, they are large as to principles; deeper investigations may lead to higher results. It is an old thought, that the sun has something to do with magnetism. We hope to derive light from magnetism, and magnetism from light; and I wait impatiently for the long days of summer, to make experiments on the rays of the sun itself. It may then be ascertained that magnetism does not exist in the mass of the earth, but perhaps in the seas, rivers, and lakes, or in the action of the sun's rays on a transparent atmosphere.'

Column for Young People.

THE WINTER WALK.

There is a variety in the succession of the seasons exciting and agreeable to all, but especially to the young. In them repeated experience has not yet in anyway dulled the charms of novelty. They hail the green leaves of spring as something which they had almost forgotten. The torrid heat of summer, with its flowers and fruits, and its long holiday rambles, forms a delightful present reality. Autumn, with its busy reapers, its yellow corn and tinted woods, its nut and apple gatherings, and hedgerows red with hips and haws, is highly relished by every boy let loose from school; and no less grim and surly winter, with his icicles, snow, and loud howling winds.

After a period of gloomy, interrupted weather, which had almost broken up our usual rambles, a day of snow came at last. The sky was darkened, and the fleecy flakes fell thick and fast. Nothing could exceed the dulness and monotony of the time spent in our imprisoned home, till the curtains were drawn, and the cheerful fire and lights in a great measure compensated for the absence of the sun during the day. We went to bed with little hopes of a walk for to-morrow—yet to-morrow agreeably disappointed us. The storm and gloom were over, and the moist clouds dispelled. A sharp frost had set in during the night—the sun shone out bright; and everything looked dazzling from the reflection of the snow, which had fallen deep the previous day.

At noon we sallied out, to wander where we list over the hard-frozen surface of the snow, all roads and tracts to guide our course being obliterated. The young people were delighted with the dazzling scene around. The surface of the country was one uniform and pure white, set off by the deep blue and equally spotless sky above. Banks, hedges, trees, were all clothed in white—the dark-blue lines of the water-courses alone appearing to cut through the uniform expanse. An unusual stillness pervaded all nature—animated beings seemed depressed and awe-struck—there was no twitter of birds or low of cattle. The red sun crept low along the horizon, and little influence seemed to come from his feeble rays. The houses and cottages scattered about were barely perceptible, except by the blue smoke which curled upwards from their chimneys. We walked over myriads of crisped crystals, pure and beautiful, and ofttimes reflecting brilliant hues of coloured light.

'How beautiful is this snow!' said Elizabeth; 'who would think that it was but the mist and dew of the sky thus changed and solidified?'

'I perceive,' said Henry, after minutely examining a portion of snow with his magnifying lens, 'that it is composed of minute crystals, mingled with a number of round spherical bodies like small pin-heads. How does this happen?'

'You are aware, as Elizabeth has remarked, that snow is only aqueous vapour solidified by cold. You remarked yesterday the broad flakes falling to the ground; now, these flakes were made up of minute spherical portions of vapour that had been deposited from moist currents of air high up in the atmosphere, and which particles were in the process of collecting together, to form one large drop of rain, when they were arrested and congealed by coming into contact with a current of air at or below the freezing-point. These flakes falling to the ground, and accumulating to form the snow, are now undergoing a still further change by the continued severity of the frost, and the little spherules are gradually passing into larger and more irregular shapes of agglomerated crystals.'

'But why should it happen to snow at this particular time,' cries Mary, 'when we have had only rain for so long a time?'

'Your question is a perfectly reasonable one, Mary, and I will explain to you the reason. Hitherto, during the season, we have had a prevalence of moist, though by no means very cold, currents of wind, blowing generally from the west and south. Yesterday, however, a cold current set in from the north and east, blowing over the frozen regions of Siberia and Russia, and around the North Pole, where the sun now scarcely imparts any of his cheering heat; the consequence is, that all our vapour has been frozen, and thus deposited as snow. This state of things will remain as long as the cold current continues to prevail in our atmosphere; but by and by we shall have a change—a warmer breeze from the ocean and from the south—and then we shall have soft weather and a thaw.'

'Indeed,' said Henry, 'I was almost going to chide Mary for the apparent simplicity of her question; but now I find that the answer explains to me what I had not thought of before. I see now how it is that in this locality of Britain, surrounded by the ocean, and subject to various changes of wind, we should have severe and mild weather alternating even in winter.'

We had now entered a little grove of birch and alder and pine trees, and we paused to admire the wonderful change which had taken place on these since our last visit. Birches and willows, and the drooping boughs of the larch, bent under a covering of pure crystalline snow, from which hung down, in glittering festoons of the most delicate forms, innumerable icicles of fantastic shapes. The dark fir seemed alone to preserve its ordinary hue, and formed a striking contrast to the others. Here the poor benumbed birds had retired for shelter. They were now dumb and spiritless.

'What a beautiful little creature is this!' cries Mary, as she almost touched a golden-crested wren perched in the cleft of an overhanging branch.

'This is the smallest of our British birds, almost approaching to the diminutive humming-birds of warmer climes, and not much inferior to some of these in its plumage. You mark that little tuft of golden yellow on its forehead, from whence it derives its name. It is a shy bird in summer, and delights, together with the robin, in the lonely solitudes of the groves, but now sharp hunger and cold force it to come near to human habitations.'

'I wish it would only think of visiting us,' said Mary, 'that I might feed it along with the robins: and see! there are two poor robins flitting about from spray to spray, and twittering that soft complaining note which I recollect so well.'

Another bird now caught their attention, of larger size and gayer plumage: it was new to all, and in one voice they inquired its name.

'This is a winter visitor, come all the way from the north of Europe. It is called the snow-flake, or snow-bunting, and is only seen here in severe winters. So accustomed is this bird to cold and elevated situations, that I have seen it, when caught and taken into a close warm room, pant and gasp, and actually die, apparently of heat and suffocation.'

We now passed on through the thicket, and came to the waterfall. Here a new scene of wonder presented itself. That cascade, which had so often amused us with its incessant gush of foaming waters, was now almost bound up and arrested in its course. Innumerable icicles hung in various shapes and sizes from the rock; large masses of concreted foam swelled out on each side; and but a faint trickling stream of water dropped down slowly, till it also was, ere it reached the bottom, arrested, and added to the icy mass.

'In this manner,' said Henry, 'I can fancy huge glaciers to accumulate in high mountains, where they prevail, and where frequent torrents of melted snow pour down their furrowed sides.'

The waterfall formed the boundary of our walk. We skirted the lake, now fast passing into a solid surface of ice, while a dense mist floating over its centre attracted the attention of my companions. 'The appearance which you inquire into,' said I, 'is a very interesting one. You know already that water, in passing from the ordinary fluid state to that of ice, gives out a quantity of heat, which is termed its latent or concealed heat. Now, the cold air over the lake is gradually cooling down its water to the freezing-point, and as this process is going on, heat is evolved, and passes upwards: in doing so, it carries a portion of vapour up along with it, and this vapour being speedily condensed by the cold atmosphere, gives rise to that fog or cloud which you perceive. It is in this way too that heat and moisture, passing up from the surface of the ocean, and becoming diffused over the neighbouring land, tend to elevate the temperature there. You thus perceive how apt and fitting are the arrangements of nature, by which, as in this process, the ocean, everywhere of a medium heat, tends, by the diffusion of its waters, to mitigate the severe cold that takes place over continents stretching into the frigid regions.'

In our homeward course we met in with tracks of the hare and rabbit, and a few traces of the roe deer. Hunger had forced these animals abroad, for they are very reluctant to leave their retreats during snow, aware that their speed of foot is then liable to be greatly retarded by their sinking downwards in it, and being also conscious that their course can then be much more distinctly traced by their enemies. The hare is particularly apt to suffer during snow; for this creature, from the shortness of its fore-legs in proportion to the hind, plunges down headlong, and is frequently suffocated!

'How distinctly,' remarked Elizabeth, 'do we hear those sounds coming from the distant village. I can count almost every stroke given on the smith's anvil, and that whistle of the herd-boy is as sharp as if it were made close by the ear. Pray what is the cause of this?'

'The chief reason is the increased density of the air, which thus better favours the transmission of sound. There is also, as we before remarked, an unusual stillness both of inanimate and animated nature. You recollect to have remarked how distinctly sounds are heard on a Sunday, when all labour is left off, which arises from the perfect stillness of the air on that day.'

'How comfortable,' observed Mary, 'are those cottages we have passed, with their snug warm roofs of thatch, and a good fire gleaming on the hearth. I sometimes, in summer, used to think that the hares and the birds had a happier life than the hard-wrought labourers, but now I see that the industry and foresight of these have been the means of procuring for them more comforts in this cold weather than are enjoyed by the creatures of the field.'

'Do not fear but the creatures of the woods and fields will also be provided for by a beneficent Creator. And do you, amid the comforts of your home, which is now about to receive you, not forget to share those blessings with any of our poor neighbours who may not be so well provided for during this inclement season.'

'We shall be out to-morrow,' they simultaneously replied, 'and as we have visited the fields and the woods to-day, with all their beauties and wonders, we shall make the round to-morrow of all the lonely cottages. To-night we shall read Cowper's "Winter Morning Walk," and see how far our observations have realised the descriptions of that delightful poet.'

FORBEARANCE.

Believe that you have really learned something, when you have learned to bear with the misinformation, the mistakes, and the prejudices of the ignorant.—*T. Cromwell.*

THE MAIDEN AND THE ROSE.

[FROM THE FRENCH OF CHATEAUBRIAND.]

The coffin descends, with white blossoms strewn over,
By the hand of a father absorbed in his woes;
Take them, O earth! Lo! now thou dost cover
Maiden and rose.

Give them not back to this world of deep anguish,
World full of mourning from birth to life's close;
The wind tears and scatters, the hot sun makes languish
Maiden and rose.

Thou sleepest!—thou, gathered so early!—nor fearest
The heat of the day in thy deep calm repose;
Both finished their course when life's morning was nearest—
Maiden and rose.

O'er the fresh heaped-up turf the lone father is bending,
Pale as the dead. Where thy sturdy root grows,
Old oak, Time has mowed down, in death at once blending
Maiden and rose.

CHAMBERS'S TRACTS.

Occasional inquiries addressed to us respecting our Miscellany of Useful and Entertaining Tracts, lead us to say a few words on the subject. The Tracts may be regarded as supplemental to Chambers's Journal, though issued in a smaller size. While the Journal is composed of a variety of short papers, each Tract consists of but one article—a little book on some subject of peculiar and popular interest. Tracts strictly religious have been long known; but with the field in which these labour, it is not our vocation to interfere. Our design is to bring all the aids of literature to bear on the *cultivation of the feelings and understanding of the people*—to impress correct views on important moral and social questions—suppress every species of strife and savagery—cheer the lagging and desponding by the relation of tales drawn from the imagination of popular writers—rouse the fancy by descriptions of interesting foreign scenes—give a zest to every-day occupations by ballad and lyrical poetry—in short, to furnish an unobtrusive friend and guide, a lively fireside companion, as far as that object can be attained through the instrumentality of books.

In the attempt to fulfil these intentions, it has been our anxious wish to reach a still more humble department of society than that to whom the pages of the Journal are more particularly addressed. That no obstacle to the extensive diffusion of these Tracts may present itself in the way of price, they are issued weekly at a *penny* (32 pages), and occasionally at a *halfpenny* (16 pages), with illustrative engravings on wood. For those who may prefer them in a more compact form, they are also issued in monthly parts at *fivepence*, and in volumes at *one shilling* each. Nine volumes, embracing eighty-six numbers, are now completed, and numbers in continuation are in course of weekly publication. We need hardly add, that, engaged in what is to us a labour of love as well as of business, no pains will be spared to insure the continued acceptability of these books of general instruction and entertainment.

Chambers's Miscellany of Useful and Entertaining Tracts are in the hands of all booksellers in the United Kingdom and colonies.

WILLIAM AND ROBERT CHAMBERS.

Edinburgh, *March* 1846.

Published by W. and R. Chambers, High Street, Edinburgh (also 98, Miller Street, Glasgow); and, with their permission by W. S. Orr, Amen Corner, London.—Printed by Bradbury and Evans, Whitefriars, London.

☞ Complete sets of the Journal, *First Series*, in twelve volumes, and also odd numbers to complete sets, may be had from the publishers or their agents.—A stamped edition of the Journal is now issued, price 2½d., to go free by post.

CHAMBERS'
EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 115. New Series. SATURDAY, MARCH 14, 1846. Price 1½d.

VULGARITY.

It is one of the pleasant features of modern times, that the humbler classes are no longer condemned to the exclusive possession of the title of the Vulgar. They were peculiarly the vulgar of all times down to the present, because amongst them, almost solely, were vulgar feelings and vulgar manners exemplified. The term is no longer appropriate, because it is at once found that many persons of lowly station are not vulgar, and that many are so who move in a superior walk. This is coming to a right point; the truth being, that vulgarity is a character of mind, our possession of which is very much the result of natural endowment, and only in part, though doubtless in large part, dependent on circumstances.

A thoroughly vulgar person is—like the poet—born, not made. He is vulgar in his cradle—as a schoolboy—a young man—all through life. No matter what his original rank, or into what rank his intellect or good fortune may carry him—vulgar he must ever be. His manners, his speech, his style of ideas, will always be gross, and requiring excuse. He will be a scoffer at courtesy and politeness, and give his thoughts only to mean things. Such persons become a curious study. We see a man rise by dint of some force of character favourably placed towards circumstances, by successful business, by talent as a literary man or artist, or in public service; and he accordingly comes to mix continually with refined persons: and yet never is the original rusticity worn off; never do his coarse voice and broad accents soften; never does he acquire the tact necessary to make his converse pleasant to his associates, and to enable him to steer clear of their delicate points. It seems as hopeless a case as that a hempen bag should be converted into a silken purse. Or we see a man rise, and acquire, as he rises, all the courtesy and refinement proper to his new condition, while his wife remains fixed in her original vulgarity. Not a profusion of the best dresses, not an elegant home, not the reflection of better things from her well-educated children, will refine such a woman. She stands by the side of her husband as a memorial of his native status, and a memento to keep him humble in mind; much the same as if one grown to manhood were to walk with some piece of his original baby-linen pinned to his clothes, to remind him that he had once been a suckling.

On the other hand, we often meet with persons in very humble circumstances, of whom we say at once, That is one of nature's gentlefolk. It is not in any aping of the manners or habits of living of the higher classes; it is not in the avoidance of a provincial dialect; it is not in any peculiarly clean or neat style of dressing. Frugal or expensive habits, in proportion to means, have nothing to do with it. It has no reference to good or bad fortune in life. It lies in the tone of the mind, as shown in speech and act. Such an exemption from vulgarity is often the more surprising, as having no visible dependence on education. The kind of person spoken of may have had little of what passes under this name; may even be wholly illiterate; and yet is (as the case may be) a lady or a gentleman. We thus see all the more in how great a degree vulgarity is an inherent quality.

It was pointed out, in a very interesting manner, in Mrs Grant's *Letters on the Superstitions of the Highlanders*, that these mountaineers, in their native purity, were courteous and refined, notwithstanding the indigent circumstances in which they mostly lived. A Highland cottager observed such delicacy of discourse, that he put in the apologetic 'saving your presence' on mentioning anything in the least degree sordid or unworthy, as a person exercising a humble kind of trade, or a churlish person, or any act bordering on vileness. The poorest *dunny wassel* sustained a natural dignity of deportment, which prevented him in discourse from trenching on vulgar things. His daily life was elegant poetry in action. The same absence of vulgarity has been remarked in the Arabs and American Indians: they may be impulsive, fierce, revengeful, but they are never vulgar. These circumstances led a living writer to speculate upon vulgarity being the vice, not of uncivilised life, but of a certain stage of civilisation. 'Its seat,' said he, 'is not among mountains and wild pastures, but in comfortable trading towns and cities of gay manufacturers. The very savage has noble and refined manners, compared with the mechanic and auctioneer. . . A man who, in the course of one year, performs the functions of a soldier, a hunter, a shepherd, a fisher, and of twenty different mechanical arts besides—who roams, in the course of his employment, over a great tract of various country, and has occasion to study, however superficially, so many of the laws of nature, the habits of animals, and the characters of men—must necessarily have his mind more stored with ideas, must be more disposed to communicate them, and must think more highly of himself than the dull mechanic, who scarcely ever sees the open face of heaven or of earth, but spends his whole life in a dungeon, putting heads on pins, or points on nails, or tossing a shuttle alternately from one hand to another.'* The writer then goes on to observe that the point of civilisation now reached has not only made the tradesman actually and absolutely an inferior being to the hunter-peasant of ancient times, but puts him in a lower place as compared with the superior classes. He comes not, as formerly, into the presence and company of the more refined, so as to obtain benefit from their example.

* Edinburgh Review, xviii. 494.

Finally, great stress is laid upon the effects of the good laws and powerful police which it is the tendency of an advanced age to establish; these, he thinks, take away from those motives to a guardedly-courteous behaviour which exist at a time when every man is liable to be answerable for his words with his life. This speculation shows the delicacy and acuteness of thought characteristic of its author; but it does not appear sound. He has not adverted to the fact, that there are many examples of the primary stage of civilisation in which there is no such notable exemption from vulgarity as is found in the hut of the Scottish Gael, the tent of the wandering Arab, and the wigwam of the American Indian. In attributing importance to the fact of the Highlanders having lived much in the company of their chiefs, he has forgot to tell us how the chiefs acquired refinement. Nor are we informed how the French, who have so good a police, should nevertheless be remarkable for politeness. We have now begun to look deeper for the causes of such peculiarities, and to think they may be found in characters originally appertaining to *race*. The Celt seems to be everywhere a courteous being. The French, who are four-fifths Celtic, show it as well as the Scottish Highlanders. Poor Patrick himself, amidst all his looped and windowed raggedness, is always allowed to possess a natural good-breeding. The Teuton, again, from whom come the bulk of the English and Lowland Scottish commonality, is an honest fellow, with an immense tendency to hard work, wealth-gathering, law-making, jury-judging, and so forth, but comparatively little disposed to cultivate refinement of speech or manners. The connexion of vulgarity with mechanical pursuits may thus be regarded, not as resulting the one from the other, but as being common results of one kind of character. As to which race possesses the qualities upon the whole most conducive to national greatness and individual happiness, there can scarcely be a question; and we therefore the more freely remark on the drudge spirit of our race. It may be asked, if we do not still see the original relation of the homely Saxon to the half-Celtic Norman in the worship which the trading Englishman is so apt to pay to wealth and rank—assuredly the most vulgar feature of his character.

Although vulgarity and non-vulgarity are thus, we think, established as inherent peculiarities, not necessarily or absolutely dependent on circumstances, it is equally certain that the mass of ordinary persons will be vulgar or otherwise, according to the external influences acting upon them, and their inclination to submit to or resist these influences. Where there are mean and slovenly habits of life, a grovelling set of tastes and ideas, a coarse and careless style of elocution, individuals are, for the most part, apt to contract the same, unless some spirit, either inherent or acquired, set them upon an opposite course; in which case we shall see them exemplifying the gentleman and lady character in the midst of comparative barbarians. It is always difficult to resist such influences; but, on the other hand, it is difficult for vulgar persons to stand out against the influence of one who is continually holding up an example of better feelings and better manners in their presence. The majority are equally liable to be swayed both ways. There is always, therefore, good hope for the diminution or abolition of vulgarity, so that only the proper agencies be duly brought to bear upon it.

Amongst these may first be cited the natural refinement and dignity of spirit which attaches to a few out of the mass. It is a spirit apt to be sneered at by mean and jealous souls; the prudent sometimes fear it as a thing leading to expense or to false positions in society. Let it rather be received as one of the genial emanations of a judicious Providence, designed to advance men out of their original savagery and squalor. Let it be fostered within all reasonable limits, as circumstances may dictate; and, even when associated with vanity or affectation, let it still have fair-play. On the other hand, let those who feel such aspirations within them, endeavour so to act as to avoid raising prejudice against their superior tastes. Theirs is an important mission in its own way; and they are concerned to fulfil it to the best of their power.

Another means to be looked to for the correction of vulgarity, is the progress of intellectual improvement among the masses. Men of all ranks are now becoming readers. Reading will give them notions above those which they find prevailing generally in the workshop and behind the counter. They will think; and thought will raise them out of the mire of rude and vulgar things. The connexion ordinarily observed between vulgarity and a totally-uncultivated and inapt state of the mind, is what we would chiefly insist upon as a reason for this expectation. Take the matter of speech alone as an illustration. Hear the clown speak, and what a relaxation of all the vocal organs attends the enunciation of his words. His language is a drawl, issued from some wrong part of his throat, through a pair of loosely-hung lips, denoting, with his vacant look, an utter unpromptitude of brain. Here is vulgarity of speech in its perfection. Listen again to the sharp citizen, whose vocal organs appear in a totally opposite condition, who clips his words, and utters twenty in the time employed by the clown in pronouncing one. This man is vulgar too; perhaps more vulgar than the boor. But this is because his better part of mind is as little cultivated. He is only sharp in the knowing faculties, in acquisitiveness, and in the skill of guarding himself against the paltry sharping and swindling to which in his daily life he may be exposed. All that could give him true elevation of mind, or true taste in discourse, is as dead in him as in the man of clods. It is only when we arrive at the man whose reflecting faculties and higher sentiments have been duly cultivated, that we find a mode of speech which we can consider as not vulgar. And what makes this the more clear is, that the dialect, or assemblage of words, is not at all concerned in deciding the non-vulgarity. Provincial terms will not seem inelegant when used by the man of cultivated intellect. Scott illustrates this point well when describing his Mrs Bethune Baliol, who is understood to have been a real person. Her 'dialect was Scottish, often containing phrases and words little used in the present day. But then her tone and mode of pronunciation were as different from the usual accent of the ordinary Scotch patois, as the accent of St James's is from that of Billingsgate. The vowels were not pronounced much broader than in the Italian language; and there was none of the disagreeable drawl which is so offensive to southern ears.' We have often heard Scotch of this kind, and can easily see that its freedom from vulgarity is owing to the cultivated condition of the mind using it. The words are materialities indifferent to the case; it is the character of mind, which we apprehend from the manner of speaking, that determines us in pronouncing the discourse vulgar or otherwise. Hence we can entertain no doubt that the mental cultivation going on in the present day must tend to diminish vulgarity. It will yet be found that the mechanic, condemned to a comparatively narrow course of routine in his trade, is not necessarily condemned to the vulgarity which the Edinburgh Reviewer attributed to him, but may be, to all intents and purposes, a gentleman—yes, we speak advisedly, a gentleman—if he have sufficient opportunities for improving his mind, and take advantage of them.

We may also look for aid to this good cause in other revolutions now in the course of silent accomplishment. Increased facilities for travelling, by enabling the many to see other places besides their own, will materially help to break down those prejudices in which, perhaps as much as in anything, vulgarity consists. That grand school of vulgarity, the tavern, will gradually sink under the temperance cause, and the effects of the throwing open of parks, gardens, and museums to the public.

Is it to be hoped that any vulgar person will read

this paper, and read it to an end? Should such be the case, let us beseech him to admit into his mind, and make a reality there, the maxim, that all vulgarity is simply so much deducted from the pleasantness of life. A rational delicacy is as cheap, or cheaper; and wherever it is, it is a well of refreshing water, making all around to smile.

LOUISE DE LORRAINE.

A TALE FROM HISTORY.

On the 30th of April 1553, at Nomein, in a Gothic chateau on the banks of the Seine, was born the Princess Louise, daughter of Marguerite d'Egmond, the first wife of Nicolas, Duc de Mercœur and Comte de Vaudemont. At the birth of this child there was no prince in the eldest branch of the house of Lorraine. Nicolas anxiously desired a son; therefore the little girl was received more with resignation than pleasure. She was not baptised, with the pomp due to her rank, at the cathedral of Nancy, where her cousin the Duc Charles de Lorraine then ruled, but received the baptismal rite at the little chapel of Nomein: her sponsors were the bishop of Toul and the Comtesse Louise de Salins, whose name was given to her.

The little Louise was scarcely two years old when Madame de Champy, her governess, one day came to seek her, all in tears, and bore her to the couch of her dying mother, who had never recovered the birth of Louise. Tapers were burning at the foot of the bed, whilst a kneeling priest recited the prayers for the dying. These prayers, repeated in a sad and monotonous tone by the persons around, filled the poor child's heart with terror, and she uttered loud cries. Her voice seemed to restore the dying mother to life; the comtesse extended her arms, and Louise forgot her fear in embracing her parent, who unfastened from her own neck a string of pearls, to which was suspended a sacred relic. 'May this guard thee, my child, as it has protected me,' said the dying mother, putting the necklace over the fair golden curls of Louise; 'and never, never part with it!' Then, unable to speak more, she pressed her already cold lips to the forehead of Louise, and signed to Madame de Champy to remove her quickly, lest the child should be witness to her death.

The Comte de Vaudemont loved his wife tenderly, and for a long time could not endure the sight of the infant whose birth had caused so grievous a loss. Louise was entirely confided to her governess, whose attachment to her pupil increased in proportion to the father's neglect. She was wholly engrossed with the care of Louise—in guarding her health, forming her mind, and implanting the germ of that fervent piety which so distinguished the house of Lorraine. But this strong affection, almost bordering on passion, rendered her often unjust to those who did not thus idolise her pupil. Mademoiselle de Montvert, under-governess to the young princess, added to this by flattery, so that the excellent disposition of Louise alone saved her from being ruined by indulgence. But if natural good qualities pass unsullied through this ordeal, still the sweetest temper is not proof against prejudices imbibed from those whom we love and revere.

The Comte de Vaudemont, having no son, thought of a second marriage. It was soon known that he had demanded the hand of Jeanne de Savoie, sister of the Duc de Nemours. This intelligence grieved the kind heart of Madame de Champy. 'The poor child will then have a stepmother,' cried she. 'Ah! Heaven have mercy on her!' and without considering the effect of her words on a girl four years old, she repeated them continually; and when the child questioned her on this fearful misfortune, she replied that it was meet to submit to the will of Heaven. So the fears of the princess were lulled.

'What is a stepmother? said she one day to Mademoiselle de Montvert.

'It is a monster who brings ruin on families,' answered the under-governess.

'Ah!' cried Louise in terror, 'it is then a woman who beats little children?'

'Too often so,' replied Mademoiselle de Montvert; but then repenting having so said, she tried to weaken the effect of her expressions by adding that all stepmothers were not cruel—that some were very kind to their husband's children. But the impression was made; and on the marriage-day, when the Comte de Vaudemont desired Louise to embrace her second mother, the child fled away weeping, and nothing could induce her to receive the caresses of her stepmother. Troubled at this estrangement, yet considering it natural, the comtesse took the part of Louise, and opposed her being sent to a convent, as the Comte de Vaudemont had angrily decided.

Two years passed, and still the dislike of Louise to her stepmother remained unconquered. This sentiment, first roused by the lamentations of Madame de Champy, had become invincible; and the comtesse, despairing of winning the love of Louise, saw her no more, except at family solemnities.

At the age of seven, the princess was seized with small-pox, and was in the greatest danger. She was immediately sent to the chateau of Nomein. Madame de Champy shut herself up with the sick child, quitted her neither night nor day, and became so distracted with grief when the physicians declared the crisis had arrived, that she was borne fainting to her chamber, where she was confined for some time with fever and delirium. Mademoiselle de Montvert had left the chateau through fear at the first symptoms of the disease. Who was there to care for and watch over the poor little princess?

The malady affected her eyes; for four days she was unable to open them; but when reason returned, she called her 'dear kind friend,' *sa bonne amie*, for so she entitled Madame de Champy.

'Why is she not here?' said the child sobbing.

'Because she is very ill herself,' said a sweet affectionate voice, 'and she needs repose. But I am here to tend you as carefully as she, my dear child. Do not disquiet yourself, but drink this; it was she who desired me to intreat you to obey me.' This request was spoken in so winning a tone, that, in spite of her repugnance, Louise swallowed the potion which touched her lips.

'Who then are you?' asked she.

'A new nurse, who will replace your governess until she recovers.'

'Ah! you will not remain with me all night, as she did?'

'Yes, my child, I will stay with you night and day until you are strong and well, and then we will try to amuse you. You will love me a little then, will you not?'

'Yes, yes,' answered Louise, seeking with her burning hand that of the person who spoke. 'I see now that it is *ma bonne amie* who sent you. You love little children? you are not a stepmother?'

The hand which Louise held was drawn slowly away; a long silence ensued. 'What is your name?' asked the sick girl.

'Jeanne,' was the reply.

'Well then, Jeanne, do you know any pretty stories, such as Madame de Champy tells me, where there are handsome knights of Lorraine, and tourneys, and hermits?

'Certainly I know some very interesting ones, which will send you to sleep as soon as hers.' She began, and in a short time Louise slept; and this quiet slumber dispelled her fever. Two days after, she was considered out of danger, but the effect of the disease on her face was dreaded. The physicians declared that she would be disfigured if she touched the spots which covered her features, and proposed to fasten her hands. The idea of being so restrained made the little invalid desperate; but her new nurse engaged to watch her so carefully, as

to prevent her touching her face. Louise wished to embrace her; and Jeanne feared not to take the grateful child in her arms, nor to remain day and night, her eyes fixed on the little sufferer. Invalids are often capricious and wilful. Louise, disliking the camphor odour of a lotion with which her eyes were bathed, refused to have it applied. Neither intreaties nor declarations that she would always remain blind could move her; and the physician departed, saying, 'If she will not be saved from blindness, I can do no more.'

'Who is weeping there?' asked Louise.

'It is I,' said Jeanne. 'How can I but be troubled, since you will be blind through your own fault?'

'Well, then, do not weep,' answered Louise in a softened voice; 'come and bathe my eyes. I will do all you wish; only do not weep.'

Jeanne took the liquid and bathed the child's eyes, praising her for her docility.

'Oh,' cried Louise with delirious joy, 'I can see! I can see clearly!' In truth her eyelids had half-opened, but the broad daylight caused them to shut quickly again.

Jeanne rushed to the window, drew close the thick damask curtains, and the partial obscurity thus obtained enabled the young princess to look around her.

'Jeanne, Jeanne!' said she, 'come, that I may see thee.' But Jeanne hid herself behind the curtains at the foot of the bed. 'Where art thou, Jeanne? Ah! it is no longer night! How happy I am! It is thou who hast cured me! Come, and let me thank thee: come, dear Jeanne! Art thou not happy also?'

'Yes, I am very happy,' replied Jeanne, advancing to take the hand which Louise extended to her. But the child, struck with sudden terror, cried out, 'Oh Heaven! the comtesse!' and fell back almost insensible on her pillow.

'No, no, it is thy mother,' said Jeanne of Savoy, bathing the wasted arms of Louise with her warm tears. 'See what thou makest her suffer! Awake, and console her!'

The tones of her voice recalled to the child's heart all the care of this tender nurse, and her fears vanished. 'You do love me, then?' said she. She was answered by fond embraces.

Thus love and confidence were established between the kind stepmother and her daughter. Louise, repenting her unjust prejudice against her, promised her the affection and submission of a child. This promise, springing from gratitude, was easily fulfilled, for the comtesse became the best of mothers to the young princess.

Louise de Lorraine grew up a lovely girl; and her stepmother conducted her to the court of the Duc Charles, to be placed with the Duchesse Claude, daughter of Henri II. and Catherine de Medicis. There Jeanne of Savoy applied herself in developing all the good and amiable qualities of Louise, and in giving her that refinement and grace of manner which the Duchesse Claude had introduced from France into the court of Lorraine.

But the princess was called soon to deplore the loss of this second mother, so worthily beloved. The comte married again. His third choice was Catherine de Lorraine, daughter of the Duc d'Aumale; a haughty and jealous woman, hating Louise on account of her great beauty. The life of the princess was now as bitter as it had before been sweet. Each day she received fresh unkindness from her stepmother; and, to obtain a few hours' peace, she asked permission of her father to go on a weekly pilgrimage to the shrine of San Nicolas. History tells us that she went thither dressed as a peasant girl, accompanied by her maids of honour, a gentleman, and a lacquey; giving away in alms the twenty-five crowns she received as her monthly allowance.

One evening, returning much wearied, she was about to retire to rest, although it was still early. Catherine de Lorraine entered her apartment, saying ironically, 'What, mademoiselle! are you about to retire at this hour, and steal away from the admiration which awaits you always? Are you not the star of the court of Lorraine, and can we receive a king here without showing him the fairest thing we possess?'

'Pardon me, madame; I do not understand you,' said Louise.

'What! do you not know that the young king was to pass here on his way to be crowned at Warsaw; that he is arrived, but will depart to-morrow; and that the Duc Charles wishes to give a festival to-night in his honour, and to show him all that is most worthy of notice at court?'

'I think, madame, that I may dispense with this honour.'

'No, no,' replied the comtesse; 'your father commands you to dress yourself immediately, and to follow me.'

This imperious command was obeyed. Louise retired, and soon appeared in a court dress, simple but elegant, which showed to perfection her noble and graceful figure. Without ornament, she appeared most lovely. As soon as the young prince saw her, he stood mute with admiration. None of the young beauties with which Catherine de Medicis loved to surround her son, had given him the least idea of a creature so perfectly lovely. Too much struck to do more than politely greet her, Henri placed himself by his sister, the Duchesse Claude, and overwhelmed her with questions about her beautiful cousin. The duchesse answered that Louise was as good as she was lovely; citing, as a proof of her gentleness, her constant submission to the unkindness of her stepmother. Henri uttered some words of indignation, and treated the Comte de Vaudemont and his wife with marked coldness.

The king's journey was precisely fixed; and to retard it a day, or to alter a stage, was to expose it to numberless inconveniences. In spite of the representations of his attendants, Henri determined to stay one day at Nancy. 'He wished,' he said, 'to spend a little more time with his sister; and then it was so sad to quit *la belle France*, even to gain a crown!'

Hunting, feasting, and dancing, occupied the second day. Never had the prince appeared to more advantage: his grace, his elegance, his noble countenance, charmed every one. All thought it unfortunate that a prince so winning and agreeable should leave France to reign in Poland; and Louise felt the same. The departure of the young king left her to her accustomed sadness. The jealousy of her stepmother, excited by the brilliant success of the princess, invented all sorts of stratagems to ruin her in the estimation of the Comte de Vaudemont. Unjustly treated by her father, persecuted by her stepmother, the courage of Louise grew fainter and fainter, and she resolved to enter a cloister.

The death of Charles IX. called the young king of Poland to the throne of France. The whole nation rejoiced at this event; for the remembrance of the victories of Jarnac and Montcoutour, gained by Henri at the age of eighteen, proved his valour; his generosity was well known; and a brave and generous king is so beloved in France!

Louise alone was indifferent to this intelligence. What to her was the elevation of a prince whom she had seen but once, and who doubtless had entirely forgotten her? She dared not demand protection against her enemy, for this enemy was the wife of her father.

One morning, while still sleeping, the Princess Louise was roused by the opening of her door. It was the Comtesse de Vaudemont. Louise doubted not but that she came to reproach her, and excused herself for not having waited on her morning toilet.

'It is I who ought to attend yours, Madame la Princesse,' replied the comtesse with deference, 'and to ask pardon for not having shown you proper respect. You are queen of France: you are promised to the king in marriage: I hasten to tell you the news. But you are

good and generous. Oh then, forget my errors, and refuse not to my children, your brothers, your august protection—for their sakes, pardon their mother!'

The princess believed herself still dreaming—surprise took away her utterance. She, the daughter of a younger branch of the house of Lorraine, to pretend to an alliance with the greatest king in Europe! It could not but be a delusion, or a stratagem to try her pride. She was about to speak, and to declare that she was not to be duped by this address, when her cousin, the Duc de Lorraine, entered with her father, to inform her of the king's demand, and to prepare her to receive the homage paid to her by the Marquis du Guastre, in the name of his illustrious master.

It was no dream. Henri III., charmed by the beauty of the Princess Louise, and still more by her noble character, preferred her to the loftiest alliances in Europe.

Scarcely recovered from her astonishment, the princess prepared to receive those of the court of Lorraine whose rank permitted them to pay their congratulations. Then she was conducted to mass as queen of France. As she entered the chapel, her eyes fell on the Comtesse de Vaudemont, who was weeping.

'Embrace me,' cried Louise. 'It is said that, when on a throne, one forgets one's friends; as for me, I will only forget my enemies.'

At these words of pardon the comtesse fell on her knees before the young princess; and all the people cried aloud, 'Long live our good queen!'

THE PUNJAB.

The Punjab, to which recent events have attracted the eyes of the British empire, is an extensive territory at the northern extremity of Hindostan. It is of a triangular shape, the ridge of the Himalaya mountains forming the base, the river Indus separating it on the north-west from Cabool, and the Sutledge on the south-east dividing it from the Rajpootana and Bhawulpoor territories. It is computed to contain 60,000 square miles, and 4,000,000 of inhabitants. The word Punjab signifies 'five waters,' alluding to the five rivers by which it is bounded or traversed; namely, the Indus, Jelum, Chenab, Ravee, and Sutledge. Though a large proportion of the territory is of a fertile soil, especially in the neighbourhood of the rivers, there are many bare sterile tracts, which no amount of cultivation can ever render useful. Little attention, however, has been paid by the people to the improvement of the land; and it is supposed that not one-fourth of the whole has been brought into cultivation. No part of it, says Mr Mountstuart Elphinstone, will bear comparison with the British portion of India, and still less with Bengal.

In describing the state of the country, it will be convenient to follow the divisions which nature has made, and to take in succession the four *doabs*, as they are called, into which the great streams sever the whole. The doab lying between the Indus and the Jelum is, at the widest part, 170 or 180 miles across. This is the least populous and most sterile district of the Punjab. The streams run in deep beds between bare eminences, which, towards the centre, rise to a considerable height. The Indus, a stream of great historic interest, forms one boundary of this district. This river divides itself into many arms, which clasp in numberless islands, but there is little picturesque beauty on its banks. 'The greatest spirit of antiquity [Alexander the Great],' says Mr Vigne in his valuable book of travels, 'descended this river, and made it known to us; but it has flowed on almost unnoticed since that event: its grandeur has been unknown, and its importance unawakened, although for thousands of years it has formed alike the boundary of a mighty continent, and the barrier of its very ancient faith. One glance at the Indus, and without seeing them, we must believe in the immensity of the Himalaya; one glance at the Himalaya, and we cease to be surprised at the volume of the Indus; and it is impossible not to venerate a river, to form which ten thousand streams have leaped from some of the most elevated and most interesting regions on the face of the earth—a river that, looking to the northward and southward, owns no horizon but that of a sea, and yet moves forward in a course so well-defined, that the Ganges, when compared with it, can only be regarded as a channelless deluge.' At the apex of the Punjab, where the Chenab (a confluence of four rivers) joins the Indus, the united streams are a mile in breadth, although the ocean is 350 miles distant. The towns in this, the largest of the four doabs, are far apart, and inconsiderable. Numerous defiles and hills throw obstacles in the way of travellers; and at the southern extremity there is an extensive desert of low sand-hills. Mr Elphinstone, who crossed it towards the upper end, where it is about 160 miles broad, describes the country as uncultivated, much cut with deep ravines and torrent courses, and, like the whole country between the Jelum and the Indus, pastured on by droves of horses of a good breed. He adds, that the country where he traversed it was the strongest, in a military sense, he had ever seen. One little valley near the Indus, however, is described as being extremely beautiful; and here the emperors of Delhi had a palace, the ruins of which are still visible. The next doab is included between the Jelum and the Chenab; a level district for the most part, upon which there is much jungle. Dirty villages, surrounded by fields of cotton, sugar-cane, and grain, are interspersed. Many wells have been constructed, by which the soil is much benefited; and some writers affirm that, if the wells were more numerous, and canals were dug, the country might be converted into a fruitful garden. The Jelum and the Chenab are both clear streams; the former attains a breadth of 300 or 400 yards, but the latter is not more than 100 yards broad. Between the last-named river and the Ravee, is the third doab, which, at the widest part, is nearly eighty miles broad. This district chiefly consists of a plain, over which tamarisks, wild indigo, and other shrubs, grow undisturbed. The mimosa, the poplar-leaved fig, and the tamarind-tree, flourish here luxuriantly; and there is no doubt that, if more attention were paid to irrigation, the produce of the country would be much increased. Some dry canals prove that civilisation has gone backwards. The towns which lie on the main road from the Indus to the valley of the Ganges are principally inhabited by Mussulmen. Large herds of oxen and buffaloes pasture upon this and the preceding district. The fourth and most eastern doab is the most neglected. There is a luxuriant vegetation, but the hand of man has been employed in other works than taking advantage of the bounties of nature. The Sutledge, usually from 300 to 400 feet broad, overflows its banks in the rainy season, and spreads its fertilising waters over a large district. In this part Lahore and Amritsir, the ancient and modern capitals of the Punjab kingdom, are situate. 'The soil,' says Mr W. G. Osborne, 'appears to be rich and prolific, as far as it is possible to judge from the small quantity of ground under cultivation; and, with a more enlightened government, there can be little doubt of the Punjab becoming one of the richest provinces of India.'

Rice is not much grown in the Punjab, in consequence of its not suiting the palate of the people; their usual food being wheat or pease boiled into a thick soup. A good deal of sugar is made from a cane with an unusually small stalk; but, after all, the supply is not equal to the demand, and an importation from British India takes place. Indigo is produced to some extent, and exported to the countries in the west. Cotton is partially grown; but the climate is not favourable to its production. The cloth manufactured by the native looms varies in price from sixpence to two shillings per yard. It is stouter, but less showy, than that of British make. There is a range of hills, extending from the Indus to the Jelum, formed entirely of rock-salt, from which a large quantity is excavated, yielding a considerable revenue to the government. Another source of revenue is the shawl manufacture of Cash-

mere; eighteen lacs of rupees being stated to be the annual profit to government. In the province of Mooltan, a district on the right bank of the Indus, seventy miles in breadth, the silk-worm is bred, and the silks are highly prized; but in the Punjab itself, the silk-worm is unknown.

Though not the most numerous, the Sikhs are the dominant part of the population. The Sikhs are a religious sect, the founder of which, Nanac Shah, was born near Lahore in 1469. At a very early age he showed a strong inclination for religious pursuits; he practised austerities, he had communications with invisible powers in trances and visions, until at length he felt justified in declaring his mission to be the reconciliation of the Mohammedan and Hindoo faiths. He preached his doctrines in many of the cities of India, meeting with much opposition, especially from the Hindoos: but he succeeded in making thousands of converts; and when he died, he conferred his spiritual functions upon Angad, a member of the warrior caste. The doctrines of these two founders of the new faith were embodied in a book called 'Grunth,' which served to keep the faithful united, and to increase their number, until they were a sufficiently large body to separate themselves from the heathens around them, and to venture on the singularity of a peculiar garb. Nine successors to Nanac appeared as spiritual leaders of the Sikhs; the tenth and last of whom bore the name of Govind. He remodelled the body, and, having ambitious designs, he prevailed upon the Sikhs to form a military as well as a religious association, like the Templar soldiers of the middle ages. He abolished caste, and enforced the adoption of a peculiar dress, which was of a blue colour. The use of tobacco was interdicted, their beard suffered to grow, and the bull was accounted sacred, as it was amongst the Hindoos. The new sect had endured much persecution, and the military regulation was partly instituted in self-defence, partly for retaliation. Their own excesses at length drew down upon them the vengeance of the emperor of Mogul, to whom the country then belonged; and so effectually were they suppressed, that for a time they seemed to have entirely disappeared. In the troubles that convulsed the northern part of Hindostan, between the invasion of Nadir Shah and the extinction of the Mogul empire (1738–1761), the Punjab became the drill-ground and battle-field of contending powers. These convulsions were taken advantage of by the Sikhs, who carried on for some time a sort of guerilla warfare against the potentate who, for the time being, had nominally conquered the country; until at length a company of twelve chiefs, supported by bands of followers, who adhered to their head in the manner of retainers to a feudal chieftain, were in open revolt against the government of the country, and, in fact, organised a kind of government of their own.

The members of this association were called Misuls, and they were powerful enough to bring into the field a body of 70,000 horse soldiers. Churut Sing was one of the first twelve Misuls, but one of the least in authority. However, his descendant, Maha Sing, possessing activity and enterprise, attached many of the subordinate officers—who professed to be independent chiefs on a smaller scale—to his banner, and success following his movements, he became the greatest of the Sikh grandees. Maha Sing was not allowed many years to acquire or enjoy his sovereignty, for he was cut off at the age of twenty-seven, leaving a son, called Runjeet, only twelve years old. The decision of character which Runjeet Sing displayed through life was precociously exhibited, for, at the age of seventeen, he assumed the command enjoyed by his father; and in the course of a few years he obtained peaceable possession of Lahore, the principal town of the Punjab. Slowly and steadily did the young Sikh make his advances; chief after chief submitted to him, till he found himself ruler of the whole country from the Indus to the Sutledge. The British government, perceiving how strongly he had seated himself in the district, and failing to see that he had imposed any limit to his ambitious designs, determined on sending an agent, the present Lord Metcalfe, to negotiate a treaty; but it was not until we had made a display of our military force, that Runjeet condescended to make satisfactory terms. By the treaty, signed in April 1809, an offensive and defensive alliance was agreed on between the Sikhs and the British government. The rajah, however, continued his system of warfare and aggression in other quarters; and such was the ability with which it was conducted, that all his projects were crowned with success. The better to effect his purposes, he took into his service two French officers; and, with their assistance, he re-organised his army, which he increased till it amounted to 50,000 regular, and 100,000 irregular troops. He subsequently received two other French officers; but he commanded these, and all other Europeans who entered his service, not to smoke tobacco (which is offensive to the religious tenets of the Sikhs), not to eat beef, and not to shave their beards. The first regulation, however, was waived, upon their consenting strictly to observe the other two. He gradually possessed himself, by sheer force, of Cashmere and Mooltan. The Affghans were his most violent enemies; but he succeeded, in the end, in becoming master of Peshawer through the treachery of Dost Mahommed's brother. From the time of the treaty of 1809 to Runjeet's death, the British and the rajah continued friends. He seems at once to have comprehended that his best policy was to show his firm confidence in our honour and power, for he treated us throughout with uniform cordiality. Several interviews, conducted after the accustomed manner of Oriental etiquette, and on the usual scale of Oriental magnificence, took place between the maha-rajah and the governor-general: presents were interchanged, and embassies received and returned. In his personal appearance Runjeet was a mean-looking man: he was small, slightly deformed, and blind of one eye from the small-pox. He loved to see magnificence about him, but his own attire was simple; and he wore few ornaments, except on state occasions. He was delighted, however, to exhibit to distinguished guests the splendid jewels of which he had deprived less fortunate monarchs. The famous diamond called Koh-i-noor ('Mountain of light'), and a string of three hundred pearls of extraordinary size, were deposited, with a number of other valuable jewels, in his treasury. He looked best on horseback, for he was an excellent rider. Of great personal bravery, he always led his troops to battle, and was seen foremost in the heat of contest. Runjeet's chief political adviser was his physician, the Fakir Uzeezoodeen, descended from the Arabs of the desert between Bagdad, Damascus, and Aleppo. These fakirs are a kind of monkish race, who secrete themselves as much as possible from the world, intermarry only amongst themselves, and affect great poverty. The rajah, however, succeeded on more than one occasion in extorting immense sums from them for the supply of his own coffers. Several of Uzeezoodeen's brothers and nephews were in the confidential service of Runjeet. The rajah's vizier was Dheean Sing, to which post he had risen from that of porter in his palace. He was descended from a noble family of the Himalaya, and the rajah's attention had been first drawn to him by his fine personal appearance.

Runjeet died in June 1839, and was succeeded by his effeminate son, Kurruch Sing. The affairs of government were, however, left in the hands of his brother Ceth Sing, whose cruelty provoked his assassination. Kurruch Sing died after a short reign of seventeen months, not without suspicion of foul treatment, and his son Non Nehal Sing stepped to the throne. A few days after his accession, he was killed by an archway falling upon him as he was riding underneath. The great men of the court now deliberated who should succeed to the vacant throne, and thinking that a woman would be more easily managed, they chose Chandkaur, the wife, in preference to Shere Sing, the brother, of the late monarch. Quarrels sprung up between the queen and

Dheean Sing, whose authority she was prevailed upon to supersede. But the people grew discontented, insurrections broke out, and Shere Sing, assisted by the vizier, assumed the sovereignty. The queen was soon afterwards murdered by four of her female slaves. The new monarch found himself entirely dependent upon his minister, Dheean Sing, who possessed great influence throughout the country; and his intellect was of a much superior order to that of his master. The power wielded by the vizier was acquiesced in by the rajah; for he allowed him to nominate his own creatures to all the principal posts, and he showed his submission by rising and folding his hands whenever the minister entered his presence—a mark of respect in use amongst the common people. Shere Sing, in due time, was assassinated, and the country has since been in a state of complete political disorganisation. The Sikhs have had many captains, who have committed all sorts of disturbances; and the only recognised law seems to have been,

> That they should take who have the power,
> And they should keep who can.

Now that the territories under our protection have been attacked, the best policy for all parties seems to be, that we should restore peace to the Punjab by at once placing it under our own superintendence; and perhaps, before this appears in print, the news of our having done so may have reached Britain. A conflict between the Indian and the British powers in this part has been expected for some time. No farther back than the beginning of 1843, a German traveller, in considering the matter, came to the conclusion that this remarkable kingdom would soon become a question of life and death for our power in India. 'Unless possessed of this, there is no security: the Indus above Attock, with the mountain chain behind Peshawer and the Himalaya mountains, form the true and natural frontier of the immense dominions of the British empire in India. When once this has been attained, all her powers can be concentrated in the interior, and civilisation take root and flourish.'

BARON REICHENBACH'S EXPERIMENTS.

We were made aware, some time ago, that a German periodical, devoted to chemistry, had presented last summer a long and carefully-prepared paper, detailing certain experiments of the Baron Reichenbach of Vienna, respecting hitherto undescribed phenomena connected with magnetism. We were informed that, conducted as they had been by a rigidly-scientific investigator, and one whose writings were usually but statements of dry facts, they might be considered as entitled to respectful notice; and yet they were of such a nature as we have been accustomed to regard with the greatest suspicion. They appeared, in short, as tending towards the domain of animal magnetism, and yet as promising to bring that theme of marvels within the scope of exact science. This is a subject, of course, on which curiosity will be greatly excited; and we are therefore glad to obtain an opportunity of conveying some account of it to our readers, in consequence of the appearance of a very readable abstract of Reichenbach's papers in the 'Dublin Quarterly Journal of Medical Science.'*

The writer sets out as follows, strictly following, we believe, the statements of the Viennese chemist, but condensing his language:—'If the poles of a strong magnet, capable of supporting a weight of about ten pounds, be passed over the bodies of fifteen or twenty persons, there will always be found some individuals among them who are affected by it in a very peculiar way. The number of such persons is much greater than is generally supposed. Of the above number, there will be three or four at least. The nature of this impression on sensitive persons, who, in other respects, may be looked upon as perfectly healthy, is not easily described, being rather disagreeable than pleasant, joined with a slight sensation, now of cold, and now of heat, as if the person were blown upon by a cold or lukewarm current of air. Sometimes they feel contractions in the muscles, and a pricking sensation, as if ants crawled over the body; and many persons even complain of sudden headaches. Not only women, but even young men, are sensible to this influence; and in young children the sensation is often very strong.' Susceptibility, however, amongst the healthy, is strongest in sedentary persons, and those suffering from secret grief and deranged digestive organs. Persons affected by nervous complaints, as epilepsy, catalepsy, hysteria, and paralysis, are peculiarly sensitive; and still more so are lunatics and somnambulists.

To pursue the abstract of our Dublin contemporary —'Actually or apparently *healthy sensitive* individuals discover, in their relation to the magnet, nothing besides the sensation just described. But the case is very different with the *sick sensitive*. Its action on them is sometimes agreeable, sometimes unpleasant—often disagreeably painful to such a degree, that fainting, cataleptic fits, and spasms, at times violent, and sometimes dangerous, ensue, according to the nature and degree of their disease. In this latter class, to which the somnambulists also belong, an extraordinary increase takes place in the sensitiveness of the senses. The patient sees, tastes, and feels better than others, and often hears what is said in the next room. This is, however, a fact well known, and is not by any means unnatural.

'The hypothesis that the aurora borealis is an electrical phenomenon, produced by the magnetism of the earth, the real nature of which is at present unknown, owing to our not having been as yet able to detect an emanation of light from the magnet, led Reichenbach to try whether persons, in a state in which the senses were thus sharpened, could detect such an emanation from the poles of a magnet. He was enabled to make trial on a young woman named Vowotny, aged twenty-five, who suffered from continued headache, accompanied by catalepsy and spasms. So sensitive was she, that she could distinguish all the things in her room, and even the colour of objects, on a dark night. The magnet acted on her with extraordinary force; and though by no means a somnambulist, she was equally sensitive with one.

'The experiment was made in a perfectly dark room. At the distance of about ten feet from the patient was placed a horse-shoe magnet of nine plates [a magnet of nine plates of alternate metals, bent into a horse-shoe form, so as to make the ends or poles approach], and weighing about eighty pounds, with its poles directed towards the ceiling. Whenever the armature of this magnet [a piece of iron, clapped upon the poles of the magnet] was removed, the girl saw both poles of the magnet surrounded by a luminosity, which disappeared whenever the armature was connected with the poles. The light was equally large on both poles, and without any apparent tendency to combine. The magnet appeared to be immediately encircled by a fiery vapour, which was again surrounded by a brilliant radiant light. The rays were not still, but continually flickered, producing a scintillating appearance of extreme beauty. The entire phenomenon contained nothing which could be compared to a common fire; the colour was much purer, almost white, sometimes mixed with irridescent colours, and the whole being more similar to the light of the sun than to that of a common fire. The rays were not uniformly bright: in the middle of the edges of the horse-shoe they were more crowded and brilliant than at the angles, where they were collected into tufts, which extended further out than the other rays. The light of the electric spark she considered much bluer. It left an impression on the eye similar to, but much weaker than, that left by the sun, and which did not disappear for several hours, and was transferred to all substances upon which she looked for some time in a painful manner.'

* New Series, No. I., February 1846. Dublin: Hodges and Smith.

Reichenbach endeavoured to verify these results by trials upon other persons, particularly a woman named Reichel, who was rendered sensitive in consequence of an accidental hurt, but was nevertheless healthy. In her case 'the appearance of the light along the four longitudinal edges of each plate composing the magnet was extremely curious, even where the edges of two contiguous plates fitted one another exactly; and where one would think rays of light given off from each plate must necessarily merge into one another at their bases, they could be distinguished with great accuracy.' Reichenbach, 'in order to be certain that there was actual light given off in these cases, made some very careful experiments with the daguerreotype; the result of which was, that an iodized plate was acted upon when placed opposite the poles of a magnet. He was also able to concentrate it with a lens; but the focal length was found to be fifty-four inches, while, for a candle, it was only twelve inches. He could discover no action of heat with the most delicate thermoscope. In some cases the patients declared they could see the surrounding objects by means of this light, and that any substance stopped its passage, as it would ordinary light: thus, for example, when the hand was laid before the poles, it streamed through the fingers. From the similarity of this light, in many respects, to the aurora borealis, Reichenbach considers them identical.' We may here add, from another source, that the baron contrived to subject his patients to an effectual test in these lens experiments; for he caused the lens to be shifted about, and the theoretically proper place for the focus on the opposite wall was invariably and at once pointed out.

Continuing his abstract, the Dublin journalist says—'From the observations of Petelin, made at Lyons in 1788, and which were afterwards verified by many others, we know that, in catalepsy, the hand is capable of being attracted by a powerful magnet, just like a piece of iron; and, as Mesmer observed, that water over which a magnet has been several times passed, can be distinguished from ordinary water by sensitive patients. Reichenbach has fully verified these facts in a large number of persons. He found that this effect took place not only during perfect catalepsy, but even afterwards, when the persons were in full possession of their senses. Miss Vowotny described the sensation to him as an irresistible attraction, which she felt obliged to obey, though against her will; that it was a pleasant feeling, combined with a cool gentle aura, which flowed over the hand from the magnet, the former feeling as if tied and drawn to the latter by a thousand fine threads; and that she knew nothing similar to it in ordinary life, it being a peculiar indescribable feeling of refreshing and extraordinary pleasure, particularly if the magnet attracted the right hand, and was not too strong.

'He did not, however, verify Thilorier's observation, that nervous patients can convert needles into magnets; and he considers, in fact, the attraction of the hand by the magnet to be of a totally different nature from that between iron and the magnet. This opinion we shall see verified further on.

'We have had no instance hitherto of the form or arrangement of the molecules of a body rendering it capable of exerting force on other bodies at a distance; but Reichenbach, by a series of experiments on magnetic water—that is, water over which a magnet had been several times passed—was led to suppose that other bodies could, in all probability, be also rendered magnetic. This he soon found to be the case in a greater or lesser degree; but he also observed that many substances, which were never in contact with a magnet, affected the nerves; and by extending his experiments, he arrived at the law that amorphous bodies possess no power similar to that possessed by the magnet, but that crystals are capable of producing all the phenomena resulting from the action of a magnet on cataleptic patients. This is true, however, only of single perfect crystals, and not of an agglomeration of crystals, such as lump sugar. Thus, for instance, a large prism of rock crystal, placed in the hand of a nervous patient, affects the fingers so as to make them grasp the crystal involuntarily, and shut the fist.

'This power is not equally distributed over every part of the surface of the crystal, but is found to concentrate itself in two points or poles corresponding to the principal axes of the crystal. Both poles were found to act similarly; but one was generally somewhat stronger than the other, with the exception that one gave out a cool, and the other a lukewarm gentle aura.'

Notwithstanding the apparent resemblance of the magnetic power in crystals to ordinary magnetism, Reichenbach satisfied himself that there is a difference; because he found that crystals do not attract iron filings, or affect the compass or needle. It appears that the ordinary magnetic power is of two kinds; one of which is this peculiar power resident in crystals, and in the living body. The learned chemist also found that a charge of this power can be communicated to bodies, as is the case with a charge of electricity. 'The readiness with which the situation of the poles could be detected by those sensible to their influence, was striking. Many of the patients could detect all the ores, even in the most complicated crystalline forms, with unerring accuracy, by their effects on them; as of course it is unnecessary to observe they could have no knowledge of crystallography. By extending his experiments, he soon discovered that the poles of a crystal gave out light exactly as the magnet does. Miss Sturman described it as a tulip-formed flame, blue at the base, passing into perfect white at the top, with scattered rays, or stripes of a reddish colour, passing upwards from the blue towards the white. The flame scintillated and flickered, and threw on the support on which the crystal rested, for a space of about eighteen inches all around, a certain degree of brightness. Miss Reichel describes the flame similarly; but, in addition, she saw a peculiar star-like light in the interior of the crystal, which evidently resulted from reflection, produced by the structure of the mineral. It may be necessary to remark, that, in order to observe these phenomena, the room must be perfectly dark, and the crystal very large; not less at least than eight inches thick, and proportionately long. Smaller crystals will, however, answer with exceedingly sensitive persons.

'The curious results produced on cataleptic patients, which we have already mentioned, excited some attention in the last century, and it was soon found that similar results could be produced without a magnet, by the hand alone. It was impossible, from the then state of physical science, to show the connexion between these phenomena and the ordinary physical ones of the magnet; and the subject was therefore passed over by philosophers, and gradually grew into disrepute, principally from the use made of it by mountebanks, and from the unsuitable name—animal magnetism—which it received. From the similarity of some of the phenomena observed by Reichenbach with those described by the elder magnetisers, he was led to think they might be the results of the same cause.

'As a magnet affects the human body, he thought that the magnetism of the earth cannot be without some influence of a similar kind: and in this he was not mistaken; for he found that, of all positions in which a nervous invalid can lie or sit, the best is in the magnetic meridian, with the head towards the north: the opposite direction is not quite so good; but the worst possible is at right angles to the magnetic meridian, with the head towards the west. He found that patients placed in the first position slept better at night, suffered less from headaches, and in general found themselves much better; while, with the head towards the west, the same patients suffered greatly; their pulse increased in frequency, hectic fever often resulted, and catalepsy was sometimes occasioned; but the moment the patient was restored to the first position, all these symptoms ceased, and were in general replaced by an agreeable

feeling of wellbeing. In some of the cases which were tried, the most extraordinary effects were produced on the patient by this change of position; and he hence concluded that the various and contradictory effects which have been attributed to the application of electricity and magnetism to the cure of diseases, have arisen from the neglect of the influence exerted by the magnetism of the earth on the patients; and to the same cause he also attributes the little success which has hitherto attended the treatment of nervous diseases.

'In extending his experiments, he found that soft iron, which loses its magnetism when removed from the inductive power of a magnet, does not lose the power of acting on the nerves; and he hence concludes that magnetism, properly so called, is perfectly distinct from this new power, as we have already seen in other instances, when speaking of the crystal. We have also mentioned that bodies placed in contact with a crystal or magnet, such as water, &c. became possessed of the same power of affecting the nerves as those bodies, and could be distinguished from portions of the same substances not magnetised. But we have now to learn that the same properties can be communicated to the human body; or, in other words, that a man rubbed, or in mere contact with a magnet or crystal, is capable of producing the same effect on the nerves as those bodies; nay more, that a man has these properties even when he has not touched a magnet or crystal; in fact, that we are a source of this peculiar power ourselves. It is unnecessary to give here the mode in which he arrived at this remarkable conclusion, as the experiments are all similar to those made with the magnet and crystal—a man being merely substituted for these latter. Like them, the hand produces an aura, attracts the limbs of cataleptic patients, and communicates a charge to other bodies which, as in the case of the magnet and crystal, disappears again in a short time; and is capable of passing through all bodies, is little influenced by the magnetism of the earth, and, like them, is polar, the principal axis being across the body, the ends of the fingers being the poles. The head and genitals very likely form secondary poles.

'But the most extraordinary part of the whole investigation is, that the tops of the fingers of healthy men continually give off tufts of light, just as the poles of crystals, while those of women give off none, or at most merely appear slightly luminous! The patients who were able to observe these phenomena, described the flame as being from one to four inches long, according as they were more or less sensitive, and of an extremely beautiful appearance.'

Baron Reichenbach has also attained what he considers as conclusive evidence, that magnetism exists in the sun's light. All bodies exposed for a time to sunlight, retain a magnetic light for some time after. 'One of his experiments is so curious, that we shall give it here:—To a piece of thick copper wire, about thirty feet long, he fastened a piece of sheet copper, about nine inches square. The end of this wire was placed in the patient's hand, and the plate exposed to the direct rays of the sun outside the window: this was scarcely done, when an exclamation of intense pleasure was heard from the patient; she instantly felt the peculiar sensation of warmth, which gradually spread from her arm to her head. But, in addition to this, she described another and hitherto totally-unknown sensation; namely, a feeling of extreme wellbeing, as the patient said, similar to the sensation produced by a gentle May breeze. It flowed from the end of the wire to the arm, and spread itself over the whole body, producing a sensation of coolness; the patient feeling at the same time strengthened and refreshed. In some of his experiments, Reichenbach substituted various bodies, and among them *a man*, for the plate of copper, and still obtained the same results.' What is extremely curious, the *yellow* part of the ray of light produces the agreeable and refreshing feeling, while the *violet* part causes the disagreeable feeling sometimes experienced from the action of the magnet; and this violet part we know to be that at which the greatest chemical action takes place. In heat, friction, and artificial light, the baron found various modifications of the same surprising effects.

It equally appears that, 'in every case of chemical action, even where it consists in nothing more than the combination of water of crystallisation, with a salt or mere solution of a body in some solvent, this power is set free.' 'If we recollect,' says our journalist, 'how manifold are the circumstances under which chemical action takes place on the earth, we will be able to see what an inexhaustible source of this power there must be. In the animal body, there is a series of such changes continually going on; we eat food, it is digested in the stomach, and converted into blood, which is again further changed into muscle, fat, &c. and these in turn are again decomposed, to yield fuel for animal heat and motive power. This continual chemical action is, therefore, the generator of the peculiar force which we find developed in man, as in the magnet and crystal. But not only does the chemical action going on in the living body generate this power, but the decomposition which ensues immediately after death is also an abundant source of it. Reichenbach, on going into churchyards on dark nights with some of his patients, discovered that graves were always covered with a lurid phosphorescent glow, about six or eight inches high; and in one case Miss Reichel saw it four feet in height in a graveyard in Vienna, where a large number of persons were daily buried. When she walked through this graveyard, the light reached up to her neck, and the whole place appeared covered with dense misty luminous fog. This, the baron conceives, explains in a very satisfactory manner the appearance of light and ghosts, &c. which have been from time to time observed over graves.'

After thus discovering several sources of the power, Reichenbach was led to the detection of it, in a certain measure, in all bodies whatever. From this flowed some observations, the curious nature of which must be our apology for borrowing so largely from our contemporary. 'Every one,' says he, 'is aware that there is a large number of persons upon whom certain substances have a certain peculiar effect, generally of a disagreeable kind, which sometimes appears to be absurd and ridiculous, and is often attributed to eccentricity; thus there are some who cannot bear to touch fur, others who do not like to see feathers; nay, some who cannot bear the look of butter. The invariable nature of this feeling, and the similarity of circumstances attending its existence among the most different races, and in the most distant countries, led Reichenbach to examine it closer; and he found that these antipathies occurred, for the most part, among persons apparently healthy, but more or less sensitive, and that they increase in degree according as persons suffer from nervousness, &c.; and that, hence, there was evidently some connexion between these sensations and the effects which he had in so many instances found to attend the action of magnetic crystals, and on similar persons.

'We have already seen that, in certain cases, the action of the crystal was attended by a disagreeable feeling, which sometimes produced painful spasmodic affections of the limbs; and that this property could be communicated to various bodies, though in different degrees; and that it is never totally absent from bodies which form perfect crystals. On this subject we have, however, already said enough; and it only remains to say a few words on the sensation of apparent difference of temperature, the disagreeable feeling, as it were of disgust, and the apparent mechanical agitation of darting pains through the body, sometimes produced by most dissimilar substances.

'Some of these sensations were felt by healthy persons, but highly sensitive individuals felt them all more or less strongly, according to the nature and extent of their disease.

'On making a number of experiments on the most

different substances, he arrived at the conclusion that all amorphous bodies which do not possess the peculiar power resident in crystals, possess, in different degrees, according to the nature of the body, and with a great degree of constancy, the property of giving rise to disagreeable sensations, sometimes accompanied by heat, and sometimes by a feeling of coolness. In the crystal, we had a power depending on the state of aggregation, or form; while in the case before us, the nature of the substance is the determining cause of some dynamical effect of another kind.'

Many curious observations remain, but our space is exhausted. Most readers will, we think, join us in wishing that the experiments of the Viennese philosopher should be repeated, and subjected to every imaginable test; as, in the first place, they seem worthy of this pains; and, in the second, it is impossible to receive such extraordinary matters into the book of science without the strongest of attainable proofs. It would now, we think, be wrong to treat such things with the indifference of mere incredulity. It is far from likely that so many persons as have now testified to peculiar effects of a zoo-magnetic nature, should have been entirely mistaken, or altogether possessed by a spirit of deception. Nor is there any improbability that we are tending towards the discovery of some new form of the imponderables, in which the human organisation is strangely concerned, and which therefore promises to possess medicative power. Where a prospect, however shadowy, holds out so much temptation, men will venture to follow it, and surely it were well for a few genuine men of science to go into the inquiry, if only to prevent the multitudes of the unlearned from breaking their heads upon it. It sometimes appears to us as if the spirit of incredulity overreached itself; and perhaps there is an instance here. Forty-six years ago, many cures by magnets, called 'metallic tractors,' were announced: they were suddenly quashed by two physicians, who similated the applications, but used bits of wood and iron disguised as tractors instead. What, however, if it should prove that the cures were real cures in both cases, only produced by a cause different from the tractors, and which resided in the bodies of the operators, and connected with an earnest exertion of the will in both cases? Things as strange have happened.

[Since the above was prepared, we have seen a pamphlet by Professor Gregory of Edinburgh—*Abstract of Researches on Magnetism and on Certain Allied Subjects, by Baron von Reichenbach*—in which there is a much more ample account of these curious investigations. To this, as well as to the Dublin Quarterly Journal of Medical Science, we would direct the attention of those who may wish to pursue the study into its minutiæ.]

ADVENTURES OF DANIEL BOONE.

It does not seem to us many years since we read in the papers an obituary notice of Daniel Boone, the founder of the state of Kentucky. Need we say what Kentucky now is? A state as large as Scotland, fertile and beautiful, and containing not much less than a million of people. Yet the first white man who set himself down to live in this grand country, only died at the end of the reign of George III.; so rapidly does the world advance in some of its districts. Boone's history is interesting, because it realises almost in our own day some of those first processes of civilisation which, in the elder world, passed long before history existed. It is the story of Jew and Canaanite—as far as that was a mere conflict for land—brought almost before our living eyes.

The spring of 1769 rose calmly over the broad woodlands which lay immediately beyond the mountains to the west of Virginia. It was a beauteous wilderness, known as yet only to the red Indian, but abounding in game and wild fruits, and whatever can form a temptation to man seeking for a residence. At that time there lived in Yadkin valley, in North Carolina, a hardy peasant of about thirty-seven years of age, a native of the county of Somerset in England, but long naturalised to America, and now married, with a family of several children. A born hunter Daniel was, and fond of nothing but hunting—a man who preferred to roam the mountain, and sleep in a cavern, or camp by a rushing spring, to the dull farm life and the home fireside. We say he was a born hunter; he possessed the instinct of the bee, and could go to his own dwelling in a *bee-line* from any point to which his wanderings might carry him. Fatigue, hunger, and exposure, he could bear like any Indian. Strong, but light, active as a deer, courageous, but cautious, kind, silent, thoughtful, he was the very man to act the part of pioneer. Two years before the above date, a man named Finlay had gone afar in the land of the red man upon a mercantile expedition. Him Daniel sought out, and learned that of a truth there was a country to the north-west where buffalo swarmed like flies in summer, and where the wild turkey and the deer were scarce worth wasting powder upon. He meditated and dreamt upon it for a year, talked with his wife about it, who endeavoured to drive it from his mind; and finally, tightening his belt, and putting a new edge upon his knife, he shouldered his rifle, bade his little family good-by, and, in company with five comrades, started in quest of the country of Kentucky.

Finlay led the way. For five weeks did the little band toil on and on through hill and valley, gushing stream and tangled woods, enduring all the inclemency of the elements, till at length they came to the Red river, a branch of the Kentucky. For months they hunted with success; but at length, in December, Boone and one of his companions fell into the hands of the Indians, from whom they only escaped by stratagem. On returning to their camp, they found it deserted by the rest. Determined to persevere, they remained in it, using great precautions against the hostile Indians; until Squire, a brother of Boone, joined him with another man, and entered upon the same kind of life. A few months after, by the death of one man and the desertion of another, the two Boones were left alone; and thus they continued to be for several months, when Squire was compelled to return to the settlements for a supply of ammunition, and Daniel was left without a dog for company—the sole white man in all that vast region.

It is impossible for men who have grown up in our tame civilisation to enter into the feelings of one so situated. Many hundred miles from all to whom he could look for aid; in a boundless wood, filled with subtle and cruel enemies; dependent upon his gun, yet with a scanty store of ammunition; without a comrade, or the hope of one—and still contented and cheerful, nay, very happy. Every day he changed his position; every night he slept in a different place from the one he had occupied the night before; constantly in danger, he was forced to be constantly on his guard; but freedom, the love of nature, the excitement of peril, and the pleasures of the chase, appear to have repaid him for all his trials, toils, and watchfulness. One circumstance, which helps us to explain Boone's security while among the bands of roaming savages, and, as we should suppose, in hourly dread of losing his life, was this: the

forests of Kentucky, at that early period, were filled with a species of nettle, which, being once trodden on, retained for a long time the impression of the foot; even a turkey might with ease be tracked in it. This weed the Indians, numerous and fearless, took no pains to avoid, while the solitary hunter never touched it: it thus became to him a sure and easy means of knowing the presence, position, and numbers of his enemies, without betraying his own whereabouts. There is an anecdote of Boone, referrible to a different period, which gives a striking idea of such a stealthy life as he now led. He had approached the Licking river from the west, at the same time that another adventurer, Simon Kenton, had reached the borders of the valley from the east. Each paused to reconnoitre, before he left the covert of the woods; and each ascertained the presence of another human being in the neighbourhood. Then commenced a process on the part of each for learning who the other was, without revealing himself; and such was their mutually baffling power of concealment, that forty-eight hours passed before either could satisfy himself that the other was not an Indian, and a foe!

Squire Boone returned at the end of June (1770), and the two brothers continued to hunt together. Meanwhile a band called the Long Hunters, led by Captain James Knox, entered the territory on the south, and spent some time in it; but Boone knew nothing of their proceedings. He and his brother remained about the vale of the Kentucky till the ensuing March, and then returned home, in order to bring more settlers, including Daniel's family.

In the autumn, Boone was passing again into Kentucky, with five families besides his own, and forty other men, when, upon the 10th of October, unlooked-for as thunder from a clear sky, a band of Indians poured upon the rear of the little emigrant army a deadly fire. Women shrieked, children squalled, the cattle broke and ran, horses reared and plunged, the young men drew their rifles to their shoulders, and the old 'treed' instantly. A few moments decided the matter: the whites were victors: but six dead men, and one badly wounded, gave them an idea of the nature of frontier life. Among the dead was Daniel's eldest son. The party retreated, and Boone spent another year in inactivity. During this time land-speculators and surveyors poured into the land of Kentucky, and roused the hostility of the Indians to a high pitch. A party of eight hundred of them were only saved from destruction by Boone's undertaking, at the request of the governor of Virginia (the Earl of Dunmore), to bring them off; in which duty he was perfectly successful.

The contention between the colonists and the mother country was now coming to a head; and it was in the midst of terrors, inspired by the policy of the British in employing the Indians as allies, that the colonisation of Kentucky took place. James Harrod was the first to build a house in that region: this was in 1774. Then one Richard Henderson, a Carolinian, by Boone's assistance, made a treaty with the Cherokees for certain lands lying between the Kentucky and Cumberland rivers, where it was proposed to establish a colony. The ground had still to be fought for with other tribes; but, in spite of all obstacles, a fort of block-houses and cabins was planted in the summer of 1775, at Boonesborough—the pioneer working with his axe in one hand and his rifle in the other. A sort of legislative council made laws for the new settlement, which was regarded as an offshoot from the state of Virginia.

Boone then returned to his family, which, with three others, he brought into Kentucky in September. The four women of this party—Mrs Boone, Mrs M'Gary, Mrs Denton, and Mrs Hogan—were the first of white complexion who entered the country—the 'mothers of the west.' The war just then breaking out, and all the horrors of Indian hostility impending, the heroism of these women deserves especial honour.

We pass over much detail as to the various settlements which were formed, and entirely overlook the doings of a remarkable man, George Rogers Clark, who had much to do with the infancy of Kentucky. It soon became necessary to keep a careful watch upon the movements of the Indians. All along the border the impression gained strength that the savages, instigated and backed by the British, would suddenly swoop down and lay all waste. The hated race of 'cabiners,' those speculators who came out to obtain a pre-emption right by building a cabin and planting a crop; the wretched traders, who were always wandering about the frontier; the hunters, who were revelling among the countless herds of game, now for the first time seen—all began, during the winter and spring of 1776, to draw closer to the stations. And within these stations men sat round the fire with loaded rifles, and told their tales of adventure and peril with new interest, as every sound reminded them how near their deadly enemies might be. And from hour to hour scouts came in with rumours of natives seen here and there; and parties of the bold rangers tightened their belts, and left the protection of their forts, to learn the truth of these alarms. But there was one who sat at such times silent, and seemingly unheeding, darning his hunting-shirt, or mending his leggins, or preparing his rifle-balls for use; and yet to him all eyes often turned. Two or three together, the other hunters started by daylight to reconnoitre: silently he sat working until nightfall. Then noiselessly he went: none saw him go. But when they observed him gone, they would say, 'Now we shall know something sure, for old Daniel's on the track.' And when, by and by, some one yet wakeful saw the shadow of Boone, as he re-entered the cabin, he found, as usual, that the solitary scout had learned all that was to be known, and the watchful slept in peace.

In July the storm broke upon the poor colonists, most of whom fled before the wrath of the Shawanese and Cherokees, leaving only a few determined little bands in the forts. It was a terrible time; yet Daniel Boone was never dismayed. One day his daughter and two other young girls were amusing themselves in a skiff on the Kentucky, while several of the male settlers looked on. Suddenly they felt the boat taking a direction for the opposite shore. A lurking Indian had swum in, and caught hold of it; and the poor children quickly found themselves prisoners amongst a band who had posted themselves in a little thicket close to the river. The settlers heard their scream as they were caught and hurried off. It was some time before Boone, and a little party of friends, could cross to commence a pursuit, so that the Indians got the start for several miles. At daybreak he recovered their trail, but soon lost it again in a thick wood, to penetrate which would have sadly impeded him. Life and death, freedom or captivity, hung upon the right use of every moment. Boone was not long at a loss: turning southward with his companions, so as to leave the track upon his left, having carefully observed its general direction, and feeling sure that the captors would take their prisoners to the Indian towns upon either the Scioto or Miami, he boldly struck forward, and travelled with all speed thirty miles or more; then turning at right angles towards the north, he looked narrowly for marks of the passage of the marauders. It was a bold and keen device, and the event proved it a sagacious one; for, after going a few miles, they came upon the Indian trail in one of the great buffalo paths. Inspirited with new hope and strength, the whites pushed forward quickly, but quietly, and on the alert, lest unexpectedly they might come upon the red men. And well was it that they used great caution; for when, after going ten miles, they at length caught sight of the natives as they were leisurely, and half-stripped, preparing their dinner, the quick-eyed sons of the forest saw them as soon as they were themselves discovered. Boone had feared that, if

their approach was known, the girls would be killed instantly, and he was prepared for instant action. So soon, therefore, as the savages were seen, he and his companions fired, and then the whole body rushed forward so suddenly, as to cause their opponents to take to their heels, without waiting for scalps, guns, knives, mocassins, or blankets; and the three terrified girls were recovered unhurt.

For two years the gallant Kentuckians maintained their posts amidst incredible hardships and dangers. It became difficult to supply themselves with food, as there was hardly any safety for cattle; and in hunting, men were frequently cut off by the prowling enemy. One day, as the women of Logan's fort were milking the cows, attended by a guard of men, the Indians made a sudden attack, and killed several persons. Such incidents were very harassing. The commander of this fort, after being beleaguered by the savages for some weeks, found himself running short of powder and shot, so that, unless relief should come soon, it seemed inevitable that they should have to surrender. The required ammunition could only be got two hundred miles off, across a wild and mountainous country. Yet he resolved to make the attempt; and he succeeded. Over mountain and vale, through tangled wood and brake, this man sped his way with two companions, and on the tenth day, he was once more within the fort. It is pleasant to know that the party was thus able to hold out till relieved.

At the beginning of 1778 there were but three stations left, containing in all a hundred and ten men; but the Indians had been baffled, and forced to retire behind the Ohio; so that a small breathing-time was afforded to the settlers. At this time Boone was compelled to go, with thirty men, to the Blue Licks, in order to prepare salt for the use of his people. He had succeeded so far in his object, when a band of Indians fell upon him as he was hunting singly in the woods. He fled, but was soon overtaken, and made prisoner. His companions, obeying gestures made by him at a distance, surrendered, and the whole party was then marched off to a British post, where several officers interceded for the ransom of Boone, but without success, for the chief had taken a fancy to him, and determined to make him one of themselves. Boone was actually obliged, for some months, to act the part of a Shawanese Indian, and to affect a reconciliation to their habits. He was made a son in some family, and caressed by father and mother, brothers and sisters, till he was thoroughly sick of them. Yet, to appearance, he was cheerful and happy. He took his part in their games and romps; shot as near the centre of the target as a good hunter ought to do, and yet left the savage marksmen a chance to excel him; and smiled, in his quiet eye, when he witnessed their joy at having done better than the best of the Long Knives. He grew into favour with the chief, was trusted, treated with respect, and listened to with attention. After some months of captivity, he was called upon to accompany a salt-making party to Chillicothe; there he saw a body of 450 painted warriors, whom he guessed to be on their way to Boonesborough, to make final work of it. Could he do nothing to save his family and friends? It was 160 miles of wild country to Boonesborough, and not a friend by the way. Yet it was necessary he should try. So, on the morning of the 16th June, he stole away without any breakfast, leaving an Indian father and mother inconsolable for his loss. Over hill and valley he sped, for four successive days, forty miles a-day, eating but one meal all the way. Such power there is in the human frame of withstanding all fatigue and hunger when the soul is alive and strong within us.

He reached Boonesborough—and where was his wife? Why did she not rush to meet him? 'Bless your soul,' said his old companions, as they hailed him like one risen from the dead, and shook his hand till it tingled, 'she put into the settlements long ago; she thought you was dead, Daniel, and packed up, and was off to Carolina, to the old man's.' There was no time for regrets, for the Indians were expected. Days, however, passed without showing them; and it was then ascertained that they were brought to a stand by his flight, believing that he must have given warning of their approach. Some weeks after, learning that the country was clear of the Indians, he started with a party of nineteen for the town on Paint Creek, intending probably to make some kind of reprisals. But this had nearly proved a fatal step, for, by the way, he suddenly popped upon an Indian party going in the contrary direction. Judging from this circumstance that a larger body must be on its way to attack the settlements, he immediately turned back; and it was well he did so just then, as he only got back a day before the Indians and British appeared in strength at Boonesborough.

It was on the 8th of August that, with British and French flags flying, the dusky army gathered round the little fortress of logs, defended by its inconsiderable garrison. Captain Duquesne, on behalf of his Majesty King George III., summoned Captain Boone to surrender. It was, as Daniel has acknowledged in his journal, a critical period for him and his friends. Should they yield, what mercy could they look for? and he especially, after his unkind flight from his Shawanese parents? Should they refuse to yield, what hope of successful resistance? And they had so much need of all their cattle to aid them in sustaining a siege, and yet their cows were abroad in the woods. Daniel pondered the matter, and concluded it would be safe, at any rate, to ask two days for consideration. It was granted, and he drove in his cows! The evening of the 9th soon arrived, however, and he must say one thing or another; so he politely thanked the representative of his gracious majesty for giving the garrison time to prepare for their defence, and announced their determination to fight. The British officers professed so much apparently sincere regret for this resolution, that Daniel was induced, after all, to come to a negotiation. It was to take place immediately beyond the walls of the fort, between nine of the garrison and a party of the enemy. To guard against treachery, the sharpest shooters stood upon the walls, ready to defend their friends. The treaty was made and signed; and then the Indians, saying it was their custom for two of them to shake hands with every white man when a treaty was made, expressed a wish to press the palms of their new allies. Boone and his comrades must have looked rather queer at this proposal; but it seemed safer to accede than to refuse; so they presented each his hand. As anticipated, the warriors seized them with rough and fierce eagerness; the whites drew back, struggling; the treachery was apparent. The rifle-balls from the garrison struck down the foremost of the assailants of the little band; and, amid a fire from friends and foes, Boone and his fellow-deputies bounded back into the station, with the exception of one, unhurt.

The treaty-trick having thus failed, Captain Duquesne had to look to more ordinary modes of warfare; and opened a fire, which lasted ten days; though to no purpose, for the woodsmen were determined not to yield. On the 20th of August the Indians were forced unwillingly to retire, having lost thirty-seven of their number, and wasted a vast amount of powder and lead. The garrison picked up from the ground, after their departure, one hundred and twenty-five pounds of their bullets.

It was amidst such scenes that the foundation of the state of Kentucky was laid, by a mere handful of rough, but high-spirited men. The year '78 was the crisis of its fate. But for the stand then made, it would probably have been no part of the American Union. Animated by the reports of the courage of the first settlers, multitudes now poured in, and soon placed it beyond all danger. In the ensuing events, the conspicuous man was George Rogers Clark, who took the British governor, Hamilton, prisoner at Vincennes. It is undoubted, however, that the real hero of the settlement was he who had first entered upon it, and who had

stood by it through all its earliest and worst struggles —Daniel Boone.*

This remarkable man closed his career in 1818, having lived to see Kentucky one of the most flourishing and populous states of the Union.

GROANS FROM BEHIND THE COUNTER.

BATING the price, or offering for a piece of goods a lower price than what is asked by the party disposing of it, well known by the term haggling, is a custom probably of great antiquity—derived, doubtless, from those barbarous times when every man tried to overreach his neighbour—when 'might made right'—but surely it is a practice altogether unworthy of the present day.

Every draper who properly understands his business will be most anxious to dispose of his goods at the lowest possible remunerating profit. For this purpose he visits the best and cheapest markets, carefully selects the most suitable goods, estimates the quantity he is likely to turn over in a given period, and determines the profit he must take, in order to be able, from this turn-over, to meet the expenses connected with his establishment, and leave himself a fair remuneration for his personal trouble and risk. Having done this, he fixes the price of each article according to its value, and in proportion to the share it should have in making up the sum estimated to be necessary for the accomplishment of the above ends; and the price so fixed becomes the lowest at which the article can be disposed of without incurring loss. Such being the case—and in every properly-conducted business it is the case—how unreasonable is it for any one to offer a lower price, or to suppose, when offered, that it will be taken? Why, this is equivalent to asking the disposer if he is willing, for the benefit of the purchaser, to be as much out of pocket as there is of difference between the price asked and the one offered.

But it may be urged, that goods are not always worth the price asked for them, and that it is therefore quite reasonable to try and bring them down to their proper value. To this it may be answered, that the lower a merchant of any kind can dispose of his goods profitably, the more it will be to his advantage, as he will be certain to sell the greater quantity. It is, therefore, the interest of every well-designing tradesman to ask a moderate price for his goods. If a higher price is asked for an article than is done elsewhere, the purchaser has the power of going there; for it is the right as well as the interest of every one to buy his goods where they are to be had at best value; but no one has a right to seek to make a man alter the price he has deemed necessary to be paid for his own property.

It is common, when the haggler is asked if the article be not worth more than he has offered, to get the reply, 'Oh, I'm no judge of its value, but I'll give you that for it.' No judge of its value; and yet, by his conduct, stating his conviction that more than its value is asked! How unreasonable, and yet how frequent, is such conduct! In fact, those who are judges of the articles they purchase are the easiest served, and are those who never haggle. It is the individuals who, ignorant of the value of what they wish to buy, suppose that, by offering a lower price than the one asked, they are taking the sure method of making a good bargain, who constitute the great majority of hagglers; and who only require to be convinced of the uselessness of the system, in order to their giving it up. There are some, indeed, so selfish, that, although conscious the article is well worth the money asked for it, will, from the desire of buying cheap, endeavour to screw down the merchant, in order that they may save perhaps the sum of one penny! Yes, and they will not blush to use more intreaty to gain their end, than the most importunate beggar would do for the same amount, although in his case it might be to enable him to relieve the cravings of hunger. Arguments with this class would be useless, for nothing will induce them to give up the practice of haggling till it has come to be universally despised.

The folly of those who think that they gain anything by this system will readily appear, if we consider the easiness with which its practice may be met by the disposer, and rendered entirely useless. They are, in nearly all cases, no judges of the article they intend to purchase: its value may be more, or it may be less, than what it is stated to be, for anything they know. Let us, for illustration, suppose a case. The price of an article is 6s.; but the disposer, believing that he will be offered less than what he asks, and conscious that he cannot take it without injury to himself, asks 7s. The person offers perhaps first 5s. 6d., and then comes up to 6s., and will give no more. The disposer, after a little higgling, accepts the offer; he gets what he wanted—the value of the article; whilst the purchaser goes home with the idea that he has made a grand bargain, and boasts to his neighbours, that 'the merchant asked 7s., but I prigged him down to 6s.' Wonderful triumph! well worthy of the person who has made an honest man practise a deceit, of which he himself, however, is the dupe. If any one has cause to boast, it is surely the disposer, who has outwitted the purchaser, and gained all he desired.

But this is not the worst; for in many instances not only is this system of no benefit to its supporters, but is the means of making them do the very thing they are so desirous of avoiding; namely, of paying more for their purchases than their real value.

The price of a piece of cloth is 10s. 3d. per yard; but, in order to be prepared for haggling, it is stated to be 11s. 6d. The purchaser in this case may be supposed to be one of those who say that they do not like to haggle, probably for the purpose of throwing the salesman off his guard, and inducing him to state the lowest price at once, but who, after all, make a habit of offering a *little* less. He says, 'That's surely too dear? I will give you 11s. for it, and take eight yards of it, and that is only 6d. less than you are asking!' Generous man! The disposer, of course, cannot say that his offer is 9d. more than the real price, since it is 6d. less than the one asked. This would at once be confessing himself as unworthy of confidence in the estimation of the purchaser, and be the means of losing not only the present sale, but future custom. The bargain is made, the money paid, and a slight discount given; and in this case, as in the former, the man goes home ready to boast of his bargain. And well he might, were things as he supposed; for his idea is, that on an amount of 88s. he has gained 4s. besides the discount, whilst in reality he has paid 6s. more than the merchant wished for his goods!

But more than this. Some people are so prejudiced in favour of this obnoxious system, that they continue to practise it even after they are shown its absurdity and entire uselessness. A woman asks the price of a yard of ribbon. She is told it is 3d.; but thinking the shopman said 5d., she cries out, 'I'll give you 4½d.;' and when made aware that the price is only 3d., replies, 'Then I'll give you 2½d.' Ridiculous as this may appear to some, it is no picture of the fancy, but a case to which all drapers of any standing can furnish many parallels. Had the disposer in this case been so inclined, he might have allowed the woman to remain in her first opinion; and doubtless she would have been as well satisfied with the idea that she had got a ribbon worth 5d. for 4½d., as she would have been in getting it for 2½d., when made aware that the price was only 3d. Let hagglers only exercise their propensity, and they are better pleased, although they should be cheated of two shillings, if you have come down one, than they would be by getting the article cheaper than its value, if you made no abatement.

True it is that a stand is now being made in country towns by many, and in our larger towns by all the re-

* Abridged from the North American Review for January 1846.

spectable shops against this abominable practice. 'No abatement' has now come to be a term of more frequent use than formerly; and the words, 'We never make two prices,' are now common in places where formerly such a statement would not only have been false, but deemed ruinous. To the proprietors of those establishments who have taken this stand, the best thanks, not only of the young men in their employment, but of the public generally, are due; for whilst on their assistants they have conferred a boon of immense importance, in rendering equivocation and deceit unnecessary, they afford to the public security of fair-dealing, and of disposing of their goods at one price, and that price, as has already been shown, the lowest they can possibly take.

Another evil to which drapers and their assistants are exposed, is want of confidence in them by the public generally. This want of confidence extends only to their professional character, without having any reference to their character and conduct as members of society. It is confined within the shop, and to the transactions of buying and selling, and cannot but be galling and hurtful to the feelings of those who are conscious that they do not deserve to be so treated.

An idea is entertained by very many that drapers are a class of men who, in respect to business, are entirely under the guidance of selfishness, and who will stop at nothing in order to effect a sale. Falsehood is attributed to them as their hourly practice; and dishonesty and roguery looked upon as necessary qualifications for their trade. It is no uncommon thing for them to be told plainly 'that they need say nothing in their own favour, for that, if they were not rogues, they would not be fit for their profession.' All do not go this length in words, but show, by their conduct, that they hold the same opinions.

How provoking is it for a young man, after conscientiously recommending a piece of goods, to be told, 'Who is to believe what you say? It is of course your interest to praise the article.' What reason is there for this sneering, cruel expression? Is it only the offscourings of society who constitute the majority of drapers in our country? Are their assistants taken from our prisons, or the haunts of vice, that they are thus looked upon and treated as common tricksters? That cases of deception and 'in-taking' have been practised by shopmen on customers, cannot be denied; but they are very rare in the present day; and when such cases have occurred, if properly examined into, it will be found that in most of them the customers have had themselves to blame, and, by their own conduct, rendered it necessary on the part of the shopman, if he wished to sell to them, to practise a deceit, and take them in. A case of this description went the round of the newspapers some time ago. A person wished to buy a silk dress, and after being shown several pieces, at length fixed on one, for which, however, she would only give a certain price, and that considerably lower than the one demanded. As it would appear, there had been no abatement allowed to be made in the house, so the offer could not be taken. The customer was just going away, when the salesman rapidly put aside the piece of silk in question, and replaced it by another of a lower price than that for which she was offering, and cried to her, as she was going out at the door, 'Come away, ma'am, you may have it.' The dress was cut off, the full price paid, and the customer highly pleased at having got it all her own way. Now, cases similar to this sometimes happen; but was not the customer primarily to blame in laying temptation before the salesman? Treat young men in such a way as will show that you deem them worthy of confidence, and they will strive to act so as to merit it. But if you treat them as rogues, be not surprised if they act towards you as such.

That drapers are a class of men whose conduct should be the very opposite of what is so generally attributed to them, will be at once apparent, when we consider that their success in trade depends upon their so acting as to gain the confidence and good-will of the public. They have a character to earn and sustain; it is for their interest to try and gather around them a class of steady and regular customers, who are made to find it agreeable and profitable to make their purchases in the same shop. And how is this to be accomplished? Is it by recommending bad articles?—by stating what is not the truth?—by taking advantage of the ignorant, and dealing unfairly? Surely not. The very opposite must be the case. Thus it is evident that, in the absence of all principle, regard for his own interests will serve to make a draper act so as to merit confidence: for where is the individual so foolish as, for the sake of the few shillings, or perhaps pence, to run the risk of losing years of that person's dealings, as he would assuredly do when his conduct came to be discovered?

It is not uncommon for a shopkeeper to find that his word in matters of business is held as nothing by those who, in other social relations, show that they regard him as a person who may be relied on. This may be primarily owing to its being understood that there are ways of speaking and acting in business which are considered as allowable, though they would be condemned in common affairs. We would remark, however, that to find one's honesty in business matters systematically doubted, must operate grievously in discouraging the desire of acting fairly in other respects. The vexation of spirit which the public want of faith excites in drapers and their assistants, must be felt in order to be properly known. Let any honourable person put himself in their place, and think how he would like to see everything he said listened to with obvious marks of incredulity, and this through a whole day, and from one day to another, and some faint conception of their sufferings may be formed. It is submitted that men thus continually liable to being lowered in their own esteem must be apt, sooner or later, to justify the suspicions with which they are regarded.

Another evil to which this class of the community, especially assistants, are exposed, is to be found in the practice of those who go 'a-shopping' without the intention of buying. This description of persons are of two classes; first, those who visit drapers' shops without any intention of purchasing, but probably for the sake of killing time, or seeing what are the fashions of the day. This class is by far the smallest of the two, and productive of the least amount of evil, as they honestly avow their intentions of not purchasing, but merely looking at the goods; and therefore no disappointment is experienced when they do not buy. It is the second and more numerous class who give rise to the evil now under consideration; namely, those who do indeed intend purchasing, but not until they have first visited a number of shops. Such persons enter the shop they have resolved to visit first with the full determination that, although they should see articles quite suited to their mind, not to purchase them till they first see what other shops have got. Some may be startled at this statement, and inclined to doubt its veracity; but it is quite true that such persons as those above-described are not rare, nor do they seek to make any secret of their conduct. Should these observations be read by any of this class, they will know that this description is a true one.

Another, and the last evil we would mention, is to be found in a habit which many have of stating the price of an article to be lower than they really paid for it. The reason for this conduct is a desire to be thought to have made good bargains, and the foolish wish of having those bargains envied. Many are heard to say, 'Some people get things unusually cheap; I can never see any of them when I come to buy.' No; and why? Because the 'some people' you allude to never bought the articles at the prices they stated, nor near to them. The evils of this practice consist in the false view it gives of the value of articles, and the consequent difficulty there is in obtaining them. An individual who has seen an article said to be purchased for a certain amount, and anxious

to obtain the same, cannot be blamed, when going to a shop to get it, and finding it to be charged considerably higher, if she should refuse to take it, and go away with the impression that the merchant wished to take her in. Here the vain desire for a little envy has led to the telling of a falsehood, has deprived the draper of a good customer, and has perhaps ruined his reputation in that customer's estimation, and in the circle in which she moves. Some, again, who are guilty of this practice, are actuated by a desire to gain not praise, but money by it. These generally work by means of another. They ask a person to bring them home, from a certain shop, a quantity of the same goods they themselves purchased a few day previous at a certain price; taking care, however, that the price mentioned be a little less than what was paid. They seem to reason in this way—'The merchant will perhaps forget what I paid; or he will not like to refuse the person I have employed; she is a good customer. Or he will not disappoint me for such a trifle: in either way, I will gain my end.' And often they do so; but the more the pity. Success only encourages future attacks; and the proper way of getting rid of this annoyance is by at once refusing to yield to it.

Such are the evils to which drapers and their assistants are exposed from the present system of doing business, and which tend materially to harass and annoy them in discharging the duties of their calling. Many of these evils are generally little known, except by those who suffer from them, and consequently their sources remain unheeded. It is to be hoped, however, that some good will be done by thus bringing the subject before the public. Should any such benefit result, even in the humblest and most partial degree, the writer of these remarks will have attained the object he had in view.

A Draper's Assistant.

WORKING MEN'S EVENINGS—THE HAMPSTEAD READING-ROOMS.

The devil is best met by *supersedeas*. That is to say, less good is attainable by direct condemnation of his allurements, than by competing against him with allurements of an equally powerful, though innocent kind. For example, it is of little use to convince working men that the public-house is a vulgar and debasing place in which to spend the evening, unless you show them another place where the time may be spent as agreeably, and with benefit instead of damage. For this reason we are always pleased to hear of any efforts, on however humble a scale, to afford harmless amusement and recreation, not to speak of instruction, to the working-classes. And where we think the efforts such as may be easily repeated elsewhere, we are glad to say what we can in their favour.

It was under such feelings that we adverted, upwards of a twelvemonth ago, to a little establishment which had been set up, under somewhat peculiar regulations, at Hampstead. We now learn, from a report before us, that the *Hampstead Reading-Rooms* continue to flourish, though with some changes on the original plan. The furnishing of coffee to the members has been given up, as seen to be not required, and classes for instruction have been introduced instead. There are now between fifty and sixty members, chiefly working gardeners, young journeymen artisans, and the sons of the village tradesmen, whose weekly payments of twopence each, with a small sum raised by subscription, appear to be sufficient to defray the expenses. These are for rent, fire, and lights, books, newspapers, and periodical publications—the classes being taught gratuitously. Two rooms, front and back—open from six till ten every evening, except Sundays—form this little temple of dawning intelligence and rational amusement. In the front room are placed the Times and St James's Chronicle (which a neighbouring gentleman furnishes gratuitously), the Illustrated London News, the Gardeners' Chronicle, Punch, and Chambers's Journal and Miscellany; and it is not unworthy of remark, that the simply literary publications are the most sought after. Here also are thirty volumes of books, obtained from a public library at the cost of a small subscription, and of course changed at proper intervals. In the back room are the classes—senior and junior—for instruction in writing, grammar, and composition, Latin, and drawing. The three first are taught together, by setting the pupils to write down the substance of some tale, or other matter, which is read aloud to them, and then going over and correcting their productions. 'By this means,' says a correspondent, 'individuals who, a year ago, would have been unable, had they attempted it, to express themselves intelligibly in writing, have become competent to write a very fair and creditable letter.' Drawing is learnt in an equally practical manner, by copying busts; while the principles of perspective are not neglected. 'It is not a little remarkable,' pursues our correspondent, 'that the Latin class should be one of the two which are best attended; and the fact suggests that working men are capable of higher mental enjoyments than is usually supposed. Some of the junior classes are conducted by a few of the more advanced members, who are desirous of extending to others the benefit they have received and learnt to value for themselves.'

Altogether, the Hampstead Reading-Rooms seem to be serving their professed object most satisfactorily. If there is anything left to be lamented, it is, that the benefits are, after all, limited to a class or grade. There are in Hampstead hundreds of *sand boys*, *donkey boys*, and other youths of similar occupations, who equally require an evening refuge for hurtless entertainment and instruction, but who could not properly be taken into this institution. Let us express our hope that some equally appropriate harbourage will be found for this class of persons; as also that institutions of the kind which we have described may speedily extend into districts where they are as yet unknown.

PECULIAR MARRIAGE-CUSTOM IN WALES.

Very little is known by the public generally of the manners and customs of the Welsh—among the lower orders of whom there still lingers much of that brotherhood which characterised our ancestors several centuries ago. One of their most curious practices is that of marriage 'biddings,' which is invariably followed in the agricultural districts; and which, however odd it may appear to us, is not without its advantages.

As soon as the wedding-day is fixed, the contracting parties print and distribute small hand-bills, of which the following is a specimen, dated so recently as the 24th of January 1846:—

'As we intend entering the matrimonial state, we are encouraged by our friends and relations to make a bidding on the occasion, which will be held on Thursday, February the 12th, at the house called Berth-lwyd, parish of Loughor, when and where the favour of your good and agreeable company is humbly solicited; and whatever donation you may be pleased to bestow on us then, will be thankfully received, and cheerfully repaid whenever called for on a similar occasion, by your most obedient servants,

Griffith Howell,
Mary Morgan.

'The young man's mother, Sarah Howell, desires that all debts of the above nature due to her be paid on the above day; the young woman's father and mother, William and Martha Morgan, desire that all debts of the above nature due to them be paid on the above day.'

The number of persons who assemble on such occasions varies according to the character and connexion of the parties interested. Both issue billets to their acquaintances; and thus there are frequently congregated as many as one hundred, or one hundred and eighty individuals, of both sexes and all ages. Should the bride and bridegroom live some distance apart, their respective retinues set out early in the morning, headed by a fiddler, whose native music enlivens the journey. They generally contrive to make a half-way meeting, where both parties amalgamate, and proceed directly to church. On the way thither, it is cus-

tomary, as in Scotland, for some of the neighbouring lads to hide behind a tree or hedge, and suddenly fire a salute, much to the consternation of the females in the joyous procession.

After the ceremony is over, the whole assemblage repair to the house of the bridegroom's father, to partake of some refreshment (for which each pays his or her quota), and to deposit their donations. The amount collected varies according to the circumstances of the individuals, averaging from L.30 to L.100; in some instances it has reached L.150. The sum thus gained affords to the 'young beginners' considerable assistance, enabling them to commence life free and unembarrassed by pecuniary difficulties. As will be seen by the printed invitation, the individuals thus assisted hold themselves responsible, in point of honour, for the repayment of the various sums contributed, when those who advance them are about to take a similar step. Should those who give the donations not require repayment on their own account, they have the power of demanding them in favour of any of their children. In almost every case there are a number of bachelor and maiden contributors; and thus the newly-wedded couple are on the whole gainers, while the repayments also fall due at distant and scattered periods.

As at the old Scotch 'penny-weddings,' the proceedings are wound up with a dance in the barn, or other convenient apartment, where, with music, dancing, and drinking, the mirth soon grows loud and furious; fortunate if it terminates as harmlessly as it began.

DEFECTIVE HOUSE DRAINAGE.

A recent number of the Lancet, in an obituary notice of the late Dr James Johnson, the editor of the Medical and Chirurgical Review, gives the following account of his death:—'At the age of sixty-seven he still carried his years bravely; his hair was scarcely bleached by so many winters—it had grown a little, and but a little, sparse upon the crown; his frame was still erect, his step firm, and not a tooth was missing from its appointed place. He had long been partial to Brighton, and the railway offered him facilities of which he determined to avail himself. He resolved to remain there for a couple of months, coming up to town three days in the week, to see his patients. Unfortunately, Brighton was so full, that he found it impossible to procure a house or apartments on West Cliff, and was compelled to repair to East Cliff, the lower portion of the town. Here the drains are frequently deranged, and it happened that they had been so at the house he selected, immediately before his visit to it. The residents and visitors had all been seized with diarrhœa, and this attacked himself, and those attending him, almost on the instant that he entered it. His intention to remain at Brighton three days in the week was not acted on. Devoured by ennui, he turned with satiety from the groups on the Parade, or the boats on the beach, and, after one attempt, he fled to the express train, and came to and returned from London daily. The excitement and exertion were too great. On the 4th October, returning by the train to Brighton, he was seized in it with a rigor. On arriving at his lodgings, he exclaimed to his wife that, unless he could procure a free perspiration, this attack would be his death. That night he was delirious. The diarrhœa, which had never ceased, became aggravated; dysentery—the low fever of the aged and exhausted—was established on it; and, worn out by purging, tormina, tenesmus, hiccup, he expired on the 10th, surrounded by his family, and sensible nearly to the last.'

HOW TO BREAK OFF A BAD HABIT

The late Mr Loudon, the celebrated writer on gardening, &c. during the time he was suffering so severely from the pain in his arm, found no ease but from taking laudanum; and he became at last so habituated to the use of this noxious potion, that he took a wine-glassful every eight hours. After the amputation of his arm, however, he wished to leave off taking it, as he was aware of its injurious effects upon his general health; and he contrived to cure himself by putting a wine-glassful of water into his quart bottle of laudanum every time he took out a wine-glassful of the potion, so that the mixture became gradually weaker every day, till at last it was little more than water; and he found that he had cured himself of this dangerous habit without experiencing any inconvenience.

LOVELY SPRING.

IN ANSWER TO THE POEM ENTITLED 'HATEFUL SPRING!'*

Thou say'st that spring is hateful, because her blossoms bright
Hide the treasure of thy selfish heart from thine adoring sight;
But what is she to all the burst, and blush, and bloom of spring?
How dark the soul, at such a time, that thinks of murmuring!

Thy love has eyes of dewy blue, but spring's young glowing sky
Has a charm that thou canst never find in earthly maiden's eye;
Bright are her lips, but spring's exquisite fairy buds eclipse
The beauty, and the whispered sweets, of thy beloved's lips.

She hath a graceful form thou say'st: go, mark the bow of spring
Sweeping the gloomy arch of heaven—a grand and glorious thing!
And tell me if that rainbow bright, the banner of the storm,
Hath not as perfect symmetry as thy fair idol's form?

Her brow is white; the snowdrop's head is whiter, purer far:
Her voice is soft; but full as soft the linnet's love-songs are.
Dark, selfish spirit! walk abroad on the young bridal earth,
And then call hateful, if thou canst, this glorious time of mirth.

All things look up to Heaven, and smile: the heart should *must* arise,
And bless the love which sends us down an earthly paradise.
The flowers come forth, like voices sent from some sweet land of love,
And breathe of some more glorious world, like the *returning dove*.

They come and bless the lowly cot, they crowd the princely bower;
The peasant has her wreath of spring, the queen her favourite flower:
They, sympathising dear ones! come, their tearful heads to wave
Over the dust of those we love, the low and lonely grave.

Ah spring—kind spring! she ne'er forgets the tear-bedewed tomb!
No; she scatters *there* her youngest buds, and bids them softly bloom:
She clothes with leaves the lattice of thy dear one's hallowed bower,
To teach thee there are lovely things besides that worshipped flower.

Go forth, and watch the glorious spring—the love, the bride of earth!
Spring—blessed spring! so full of heart, and harmony, and mirth!
Oh, I would have all hearts rejoice, all tongues exulting sing,
'O God, we bless thy tireless love, for the bright and beaming spring!'

We know the human bosom hath a world of love to pour
At the feet of some fair object it delighteth to adore;
That world of love should all be His who sends His angel spring,
And, next to Him, to all things bright and beautiful should cling.

Give me the great, grand heart, as large as it was made to be,
That takes in God, and heaven, and earth, like a deep and glorious sea;
That sees the stamp of Beauty broad and wide on everything,
And loves that beauty everywhere—and dearly loves the spring.

Why dost thou narrow up thy soul to one thing God has made?
Why should one star of loveliness His boundless sunshine shade?
Idolater! go, mark the flowers, and hear the bright birds sing,
And bless the opened hand of love for the gay and glorious spring!

* See No. 110 (page 96 of present volume).

EDITORIAL NOTES.

A correspondent, referring to a late paper on the works of Gervase Markham ('The English Housewife in 1645,' published in No. 98, p. 313, of 4th volume of the Journal, new series), where we had remarked *haggis* as described among other English dishes of the seventeenth century, directs our attention to the fact, that this peculiar preparation is alluded to in an English book of much older date, namely, Lydgate's *Storie of Thebes*. Warton represents Lydgate as at his highest eminence as a poet about the year 1430. In this *Storie*, a host at Canterbury, inviting his guest to supper, tells him he will have, among other dishes, 'a round hagis.' It is curious thus to ascertain that England, in an earlier and less dainty state of her cuisine, did not repudiate the homely, yet relishable fare which has since been left to the sole enjoyment of us northern barbarians, amongst even whom it is now nearly extinct. The same correspondent suggests that *sheep's head* may have been a Roman dish, as in Juvenal (book i., satire 3) the following lines occur:—

Quis tecum sectile porrum
Sutor et *elixi vervecis labra* comedit.

With reference to the biographic sketch of Theodore Hook, in No. 110, we are informed that that unfortunate wit, besides the late Dean of Worcester, had a *second brother*, now living, the result of a third marriage of his father.

No. 116. New Series. SATURDAY, MARCH 21, 1846. Price 1½d.

ANIMAL HUMANITY.

It is extremely curious to observe in animals ways and doings like those of human beings. It is a department of natural history which has never been honoured with any systematic study: perhaps it is thought too trifling for grave philosophers. I must profess, however, that I *feel* there is some value in the inquiry, as tending to give us sympathies with the lower animals, and to dispose us to treat them more kindly than we generally do.

The *sports* of animals are peculiarly affecting. They come home to our social feelings; and the idea is the more touching, when we regard the poor beasts as perhaps enjoying themselves when on the very brink of suffering death for *our* enjoyment.

It is reported by all who have the charge of flocks, that the lambs resemble children very much in their sports. In the mellowed glow of a June evening, while the ewes are quietly resting in preparation for their night's sleep, the lambs gather together at a little distance, perhaps in the neighbourhood of a broomy knoll, and there begin a set of pranksome frolics of their own, dancing fantastically about, or butting, as in jest, against each other. The whole affair is a regular game at romps, such as a merry group of human younkers will occasionally be allowed to enjoy just before going to bed. It is highly amusing to witness it, and to trace the resemblance it bears to human doings; which is sometimes carried so far, that a single mamma will be seen looking on close by, apparently rather happy at the idea of the young folk being so merry, but anxious also that they should not behave too roughly; otherwise, she must certainly interfere.

Monkeys have similar habits. In the countries of the Eastern Peninsula and Archipelago, where they abound, the matrons are often observed, in the cool of the evening, sitting in a circle round their little ones, which amuse themselves with various gambols. The merriment of the young, as they jump over each others' heads, make mimic fights, and wrestle in sport, is most ludicrously contrasted with the gravity of their seniors, which might be presumed as delighting in the fun, but far too staid and wise to let it appear. There is a regard, however, to discipline; and whenever any foolish babe behaves decidedly ill, the mamma will be seen to jump into the throng, seize the offender by the tail, and administer exactly that extreme kind of chastisement which has so long been in vogue among human parents and human teachers.

That there is merriment—genuine human-like merriment—in many of the lower animals, no one can doubt who has ever watched the gambols of the kid, the lamb, the kitten, or of dogs, which

> 'Scour away in lang excursion,
> And worry other in diversion.

But there is something to be observed in these sports still more human-like than mere sport. The principle of *make-believe*, or jest as opposed to earnest, can be discerned in many of their merry-makings. A friend of mine one day observed a kitten amusing itself by running along past its mother, and giving her a little pat on the cheek every time it passed. This must have been done as a little practical joke. It may be added, that the cat stood it for some time very tranquilly; but at last, appearing to get irritated by the iteration of such absurd procedure, she gave her offspring a blow on the side of the head, that sent the little creature spinning to the other side of the room. The kitten looked extremely surprised at this act of mamma, as considering it very ungracious of her not to take the joke in the way it was meant. The same gentleman has observed similar fun going on in a department of the animal kingdom certainly far below the point where we would have expected it; namely, among spiders. He has seen a little spider capering about its parent, running up to it, and then away again, so as to leave no doubt upon his mind that the creature was making merry. Ants, too, have their sports. They pat each others' cheeks, wrestle and tumble, and ride on each others' backs, like a set of schoolboys.

The *kindly social acts of animals*, among themselves and towards mankind, form the next series of phenomena to which I would direct attention. Burns justly eulogises, as a high virtue, the being disposed to hold our being on the terms, 'Each aids the others.' It is the grand distinction of human society, to interpose for the comfort and protection of each other in needful cases. Many families of the lower animals are indifferent on such points; but others are not. It is not yet many months since some workmen, engaged in repairing the cathedral of Glasgow, observed an unusual concourse of sparrows coming regularly to a hole in one of the slanting walls, and there making a great ado, as if feeding some birds within. Curiosity being at length excited, the men proceeded to examine the place, and found that a mother bird, after the flight of her brood, had got her leg entangled in some of the threads composing her nest, so that she was kept a prisoner. The leg was visibly swollen by the chafing produced by her efforts to escape. In this distressing situation the poor bird had been condoled with and fed by her fellows, exactly as a human being might have been in similar circumstances.

Not long before that time, in the pleasure-grounds of Rannoch Lodge in Perthshire, a little field-bird was observed by the gamekeeper to wound itself by flying against one of the so-called invisible fences; whereupon a companion, not stated to have been a mate, came and sat beside it, as it were sighing and sobbing, careless whether he himself was caught—which was easily done

by the spectator of the scene. He took home the two birds, and had them carefully attended to, till the wounded bird had a little recovered; he then set them both at liberty; and, to pursue the narrative of a local newspaper, 'nothing could have been more touching than the affectionate solicitude with which the one watched the progress of the other—now lending it a wing, and again cheering it while it rested, until both were at length lost to the view of the kind-hearted gamekeeper.'

Instances like these could be multiplied indefinitely. They are the daily habits of some creatures. The dugong, a whale-like animal, but herbivorous, has the social feeling so strong, that, when one is harpooned, the others flock around, regardless of their own danger, and endeavour to wrench out the weapon with their teeth. In what is this different from a soldier shielding a comrade, or endeavouring to rescue him from dying of his wounds on the field of battle? Of the many anecdotes told respecting rational-looking proceedings of animals for the benefit of each other, I shall adopt one related by Monk Lewis in one of his letters. 'About ten days ago [writing in Jamaica], one of the farm-keeper's wives was going homewards through the wood, when she saw a roebuck running towards her with great speed. Thinking that it was going to attack her with its horns, she was considerably alarmed; but, at the distance of a few paces, the animal stopped, and disappeared among the bushes. The woman recovered herself, and was proceeding on her way, when the roebuck appeared again, ran towards her as before, and again retreated, without doing her any harm. On this being done a third time, the woman was induced to follow it, till it led her to the side of a deep ditch, in which she discovered a young roebuck unable to extricate itself, and on the point of being smothered in the water. The woman immediately endeavoured to rescue it, during which the other roebuck stood quietly by, and as soon as her exertions were successful, the two animals gallopped away together.'

The same measures have often been adopted by dogs on account of a master who has fallen into any kind of trouble. Leaving him, they run home, scratch at the door, and, on gaining admittance, pull the skirts of wife or servant, to induce her to come to the spot for his relief. The horse, too, sometimes shows this species of sagacious kindness. Not three months before the time when this paper was written, the horse of a man called Graham, belonging to the Stainmore collieries, came home in the evening without him. According to a local chronicler, the animal 'proceeded direct to the house-door, and commenced neighing, and seemed greatly distressed. Being a docile, playful animal, Graham's family did not at first take much notice of its complaints, not thinking but that Graham himself was not far distant; he, however, not arriving in a short time, and the horse still continuing its wailings, they became a little alarmed, and a person was therefore despatched on the road in search of him. He was found lying on the road near Coupland Beck, a distance of two miles from Appleby, with his head severely cut, and in an insensible state. The evening was extremely cold, and a pinching frost having set in, he would doubtless have perished had he lain much longer.' It appeared that the poor man had fallen asleep, and in that state tumbled from his cart.

The sense of *duty* is another of the human-like characteristics of animals, and one of those best known. A dog will take a trust, and fulfil it as well as a man. A very affecting instance was presented about two years ago by a female dog belonging to a shepherd near Dunning in Perthshire. The man had bought for his master, at Falkirk, four score of sheep, which he immediately despatched homewards, *under the care of his dog alone*, though the flock had to go seventeen miles through a populous country. The poor animal, when a few miles on the road, dropped two whelps; but, faithful to her charge, she drove the sheep on a mile or two farther; then, allowing them to stop, returned for her pups, which she carried for about two miles in advance of the sheep. Leaving her pups, the collie again returned for the sheep, and drove them onwards a few miles. This she continued to do, alternately carrying her young ones, and taking charge of the flock, till she reached home. The manner of her acting on this trying occasion was afterwards gathered by the shepherd from various individuals, who had observed these extraordinary proceedings of the poor animal on the road. It is painful to add, that she did not succeed in bringing her offspring alive to her master's house. As a pendent to this tale, take one relating to a Newfoundland dog, which lived a few years ago with a family in one of the southern states of the American Union, and which had rescued one of its master's daughters from drowning. The family had to proceed in a schooner for the city of St Augustine: they had embarked, and the vessel was swinging off from the pier, when the dog was missed. To quote a newspaper narrative:—'They whistled and called, but no dog appeared; the captain became restive, swore he would wait no longer, gave the order, and the craft swept along the waters with a spanking breeze, and was soon a quarter of a mile from the shore. The girl and her father were standing at the stern of the vessel, looking back upon the city, which they had probably left for ever, when suddenly Towser was seen running down to the edge of the wharf with something in his mouth. With a glass, they discovered that it was his master's pocket-handkerchief, which had been dropped somewhere upon the road down to the vessel, and which he now recollected, with some compunctions of conscience, he had sent his shaggy servant back to look after. The dog looked piteously around upon the bystanders, then a the retreating vessel, and leapt boldly into the water. His master immediately pointed out the noble animal to the captain, and requested him to throw his vessel into the wind, until the dog could near them. He also offered a large sum if he would drop his boat, and pick him up; told him of the manner in which he had preserved the life of his daughter; and again offered him the price of a passage if he would save the faithful creature. The girl joined her intreaties to those of her father's, and implored that her early friend might be rescued. But the captain was a savage; he was deaf to every appeal of humanity; kept obstinately on his course; and the better animal of the two followed the vessel until, his strength exhausted, and his generous heart chilled by despair, he sank among the more merciful billows.'

The high degree in which animals are susceptible of *attachment*, needs little illustration; for every one knows the dog and horse. One is, however, less struck by the general fact, that these animals, and some others, devote themselves to a kindly and servile association with man, than by the particular friendships which certain animals form with individuals of our species, as if from some peculiar, though inscrutable election of qualities, or, it may be, merely from accidental contact. We can even, in some instances, see this attended by a demonstration of an *auld lang syne* feeling, such as usually attends the rencontres of human friends long separated. For example—A few years ago, a sailor, entering a show of wild beasts at Plymouth, was surprised to find a tiger very much agitated at his approach, acting always with the greater violence the nearer he came to its cage. The keeper, to whom he pointed out the circumstance, remarked that the beast must either be greatly pleased, or as much annoyed. Upon this the sailor went close up to the den, and, after a few minutes, during which the animal lashed its sides with its tail, and uttered the most frightful bellowings, he discovered that it was a tiger which had been brought home to England a few years before under his especial care. It now became Jack's turn to be delighted, as it appears the tiger was, in thus recognising his old friend; and, after making repeated applications to be permitted to enter the den, for the purpose, as he said, of 'shaking a fist' with the beautiful animal, he was

suffered so to do: the iron door was opened, and in jumped Jack, to the delight of himself and striped friend, and the astonishment of the lookers-on. The affection of the animal was now shown by caressing and licking the pleased sailor, whom he seemed to welcome with the heartiest satisfaction; and when the honest tar left the den, the anguish of the poor animal appeared almost insupportable. Was not this the very same sentiment which makes us sing, 'Should auld acquaintance be forgot?' But animals of much lower grade will strike up friendships with men. There is an anecdote of a goose which became unaccountably attached to a farmer in Ireland, insomuch that it raised a joke at his expense. One day it followed him to a court, which he was attending upon public duty, and so irritated was he, that he twisted his whip about its neck, and swung it round till he thought it dead. Some time after, when he was lying dangerously ill, he was horror-struck to observe the same goose looking in at his window. His daughter told him it had waited there, with an air of the greatest concern, during the whole time of his illness. Of course there was no standing this disinterested attachment, and the poor goose was instantly admitted into favour.

This predilection of animals for particular persons was once the means of deciding, very amusingly, a case before a court of justice. It was a Dublin police-office, and the object of dispute was a pet parrot, which had been stolen from a Mr Davis, and sold to a Mr Moore. The plaintiff, taking the bird upon his finger, said, 'Come, old boy, give me a kiss,' which the parrot instantly did. A youth, in the defendant's interest, remarked that this proved nothing, as the parrot would kiss anybody. 'You had better not try,' remarked the plaintiff. Nevertheless the young man asked the parrot to kiss him. Poll, Judas-like, advanced as if to give the required salute, but seized the youth's lip, and made him roar with pain. This fact, and the parrot's obeying the plaintiff in several other requisitions, caused it to be instantly ordered into the possession of its original master.

Human foibles, too, are participated by animals. The dog, I grieve to say, is capable of both envy and jealousy. A gentleman, calling one day upon Dr Gall, at Paris, found that most original observer of nature in the midst of birds, cats, and dogs, which were his pets. 'Do you think,' said he, turning his eyes to two beautiful dogs at his feet, which were endeavouring to gain his attention—'do you think that these little pets possess pride and vanity like man?' 'Yes,' said the other, 'I have remarked their vanity frequently.' 'We will call both feelings into action,' said he. He then caressed the whelp, and took it into his arms. 'Mark that mother's offended pride,' said he, as he walked quietly across the chamber to her mat. 'Do you think she will come if I call her?' 'Oh yes,' answered his friend. 'Not at all.' He made the attempt; but she heeded not the hand she had so earnestly endeavoured to lick but an instant before. 'She will not speak to me to-day,' said Dr Gall.* Not long ago, it was stated in a Plymouth newspaper that two dogs, a setter and a little spaniel, being kept in the same kennel, the larger animal manifested a great jealousy of the smaller. At length the little dog was missing, and the setter was found to have taken ill. The latter dying very quickly, was opened, when the little dog was found almost entire in its stomach.

Revenge is not a conspicuous animal passion. The incapacity of deep impressions is perhaps a preventive to it. But it is not quite unknown. James Hogg tells a story of a dog which was much annoyed by the persecutions of a larger animal of his own species, till one day he brought a still more powerful friend, which set upon, and gave the persecutor such a worrying, as served to deter him from his cruelty in future. Mr Thomson, in his *Note-Book of a Naturalist*, relates a similar circumstance as occurring some time since at the seat of a noble lord in Surrey. 'In the park are two large pieces of water, divided by a small isthmus, which widens considerably at one extremity, and at the time in question, a pair of swans were the occupants. A doe and her fawn, belonging to a herd of deer in the park, coming down to one of the pieces of water to drink, were immediately set upon by the swans; and the fawn, by their joint efforts, was got into deep water, and drowned. After a considerable interval of time, when the swans were one day on the wide part of the isthmus, and thus separated from their element, and at a disadvantage, a rush was made upon them by a number of the deer, which trod under foot, and destroyed one of them. The bereaved doe must have had some means of communicating her loss to the other deer, and of urging them to help her in her revenge; and the most remarkable part of the transaction is, that the deer must have had a kind of consciousness of the fitness of the moment, when the swans were, to a great extent, defenceless, or at least deprived of their greatest advantage, and had no means of effecting their retreat to the water.'

An anecdote was lately given in a newspaper, which would show animals to be even capable of a sense of equity; but perhaps there is some exaggeration about it. A gentleman, visiting a menagerie at Penrith, found there a fine lioness with two cubs. While he was observing her, the keeper handed in a sheep's head to the cubs, which instantly began to quarrel over it, as if each desired exclusive possession of the prize. In the midst of the turmoil the lioness rose and advanced, and with two well-directed cuffs, sent them cowering into the corners of the den. She then lay down, and deliberately dividing the spoil into two equal parts, assigned one to each of her young ones; after which, without taking a morsel to herself, she retired, and lay quietly down again. If the fact was exactly as thus related, it certainly forms one of the most curious illustrations of animal humanity which we have on record.

But, it might be asked, what class of ordinary human actions is not imitated by animals? A gentleman comes home late at night, and uses the knocker to gain admission: a cat belonging to a friend of ours used to do the same. A weary pedestrian rejoices to get a cast in a passing omnibus: in the *Magazine of Natural History* (1833), is an anecdote of a dog which, being in like circumstances, came into such a vehicle on one of the London thoroughfares, and could not be induced to come out, till he voluntarily left it at a place which seemed to be his home. An innkeeper's son will take a drive for half a stage in one of his father's coaches, and come back in another: this also did Ralph, a famous raven of the Elephant and Castle public-house: he knew all the coach-drivers who plied at that inn, and would take short jaunts on the coach-top with them, till he met some other coach coming the contrary way, when he would change coaches, and return. To pass to something very different:—The persecuted Covenanters, when met for worship in the lonely glens of Ayrshire, used to plant a sentinel to watch the approach of the dragoons. This also do the red-deer in the Highlands. The youngest of the herd is set to watch, while the rest browse; and if he leave his post, they butt him till he shows he is corrected. Men make hay—with and without favour of sunshine—knowing it is needed for winter store. The marmot of the Altaic mountains makes hay also, to serve as winter fodder. He piles it in stacks as high as a man, and the selection of herbs for the purpose is far beyond what human haymakers can pretend to. 'If at first you don't succeed,' says the moralist, 'try, try, try again.' The spider did this nine times in the sight of the fugitive Bruce, and taught him to regain a kingdom. So also has the lion been seen, after failing in a leap at his prey, to go back to try it over again, though the prey was gone, as anxious to investigate the cause of failure, and to train himself up to the proper pitch of power for a future occasion. To emigrate for better subsistence and climate has been

* Medical and Physical Journal, November 1829.

a practice of the human family since its earliest ages. It is now fully admitted that the migrations of animals are prompted by precisely the same motives. And as men, in the infancy of navigation, crept along the shore, or navigated from headland to headland, or, in crossing, chose the narrow passes, and those which were assisted by intervening islands, so birds of passage adopt all these facilities. Those which move from Scotland to Ireland, proceed by the straits of Portpatrick. They wait for a side wind, too, to aid them. So also Capri is used as a resting-place in crossing the Mediterranean; as the bishop knows by the tithe of quails, which is said to form an important part of his revenue. In what, moreover, does the return of continental tourists in winter, each to his particular brick dwelling in London, differ from the resumption of particular residences by the swallows in spring? The absence of title-deeds and rent makes the only distinction. There is even some inscrutable means of communicating ideas amongst animals. The deer, in the anecdote already given, must have had a talk about the swans. Even creatures of different families, as cows and horses, have been ascertained to interchange their thoughts.

There is a disposition amongst us to deny all that assimilates animals to ourselves, as if there were something derogatory in it. Miserable pride and delusion, to suppose there can be any good in battling off one of God's facts! When I hear of men endeavouring to extinguish the idea of animal intellectuality and sentiment, by calling it instinct, I am always reminded of the weak creatures of the desert, which get their heads into a bush, and then think that they cannot be seen. What imaginable benefit can there be in any such falsity? Rather let us acknowledge the beautiful and ingenious qualities of animals, as they actually are, seeing in them the hand of a Divine author, and something which even we ourselves may occasionally imitate with advantage.

MR BROOKE IN BORNEO.

HIS INTRODUCTORY VISIT.

THE measures which have been recently taken for the suppression of piracy in the Indian Archipelago, have directed attention, in an especial manner, to Borneo, one of the largest and most fertile of these islands, and one which, under a new system of rule, is likely soon to assume an important position in the eastern world. Since the time of Sir Stamford Raffles, the East India islands have in a great degree been neglected. Britain has almost exclusively concentrated her energies in Hindostan and the adjacent continent; and the Dutch have neither the power nor the disposition to look beyond the interests of their present paltry monopolies. It is thus that the islands of the Asiatic Archipelago—islands of unrivalled beauty and fertility—lie neglected, and almost unknown. In this condition they were first beheld in 1830 by a British gentleman, who made the voyage from Calcutta to China in search of health and amusement. Struck with the anomaly, he inquired and read, and became convinced that Borneo and the eastern isles afforded an open field for enterprise and research. He had held advantageous situations in India; but, being wounded in the Burmese war, had relinquished the service, and was now ready for any undertaking that might present itself congenial to an energetic and inquiring mind. One ruling thought took possession of his mind: 'to carry,' says his friend, 'to the Malay races, so long the terror of the European merchant vessel, the blessings of civilisation—to suppress piracy, and extirpate the slave-trade, became his humane and generous objects. Often foiled, often disappointed, with a perseverance and enthusiasm which defied all obstacle, he was not, until 1838, enabled to set sail from England on his darling project. The intervening years had been devoted to preparation and inquiry—a year spent in the Mediterranean had tested his vessel, the Royalist, and his crew—and so completely had he studied his subject, and calculated on contingencies, that the least sanguine of his friends felt, as he left the shore—hazardous and unusual as the enterprise appeared to be—that he had omitted nothing to insure a successful issue. "I go," said he, "to awake the spirit of slumbering philanthropy with regard to these islands; to carry Sir Stamford Raffles's views in Java over the whole Archipelago. Fortune and life I give freely: and if I fail in the attempt, I shall not have lived wholly in vain."' This gentleman was Mr James Brooke, then in his thirty-fifth year—the son of the late Thomas Brooke, Esq. of the East India Company's civil service, and a descendant of Sir Robert Vyner, lord mayor of London in the reign of Charles II. We shall now endeavour to follow him in his career, from the time he left England in 1838, to the end of 1845—a period which witnessed peace restored, through his instrumentality, among the native tribes of Borneo; piracy in a great measure suppressed; a trade established with Sincapore; himself installed rajah of Sarāwak, and agent for the British government in Borneo! The story of his career, so very unlike the common course of events in modern times, reads more like a tale of romance than the journal* of veritable adventure.

The Royalist, which belonged to the royal yacht squadron—a circumstance admitting it, in foreign ports, to the same privilege as a man-of-war—left the Thames on the 27th of October 1838, properly equipped for a four months' voyage, and carrying a crew of twenty hands, trained for three years by her captain—Mr. Brooke. Having touched at Rio Janeiro, Cape of Good Hope, and Sincapore, it was not till August in the following year that the vessel anchored off the north coast of Borneo—then almost a *terra incognita*, both as regards its productions and people. We were aware, no doubt, of its tropical position and general fertility, and that it was inhabited by native Dyaks, Malays, and a few Chinese settlers; but beyond this, the island was less known than it was fifty years ago. On the 14th, the Royalist anchored abreast of Sarāwak, and prepared for the reception of Raja Muda Hassim, heir-apparent to the sultanship of Borneo Proper, from which he was temporarily absent, for the purpose of suppressing some Dyak rebellion. And now for a glimpse of Sarāwak, before it became the thriving capital of Mr Brooke's dominion. 'The town consists of a collection of mud huts, erected on piles, and may contain about 1500 persons. The residences of the rajah and his fourteen brothers occupy the greater part, and their followers are the great majority of the population. When they depart for Borneo, the remainder must be a very small population, and apparently very poor. The river affords a few fish; but there is little sign of cultivation, either of rice or other grain. Fowls and goats seem the only other means of subsistence of these people. The geological features of the country are easily described. Vast masses of granite rock are scattered along the coast; for instance, Gunong Poe, Gadang, Santobong, &c. &c. which have evidently, at some former period, been detached islands. The spaces between these granite masses are now filled in with alluvial soil, intersected in every direction with rivers and streams, and on the low alluvial bank of the Sarāwak river stands this little town. The distance from the sea is about twenty-five miles, through banks of mangrove and the Nepa palm, until approaching the town, where jungle trees first appear. The breadth is about 100 yards, and the depth six fathoms, at low water spring tides, in mid river, opposite the rajah's residence.' Here Mr Brooke anchored, gave a salute of twenty-one guns, and pulled ashore, to visit the great man.

Muda Hassim received them in great state, seated in his hall of audience; which, outside, was nothing but a large shed, erected on piles, but within was decorated

* The Expedition to Borneo of H. M. S. Dido, for the Suppression of Piracy: with Extracts from the Journal of James Brooke, Esq. of Sarāwak. By Captain the Hon. Henry Keppel, R.N. 2 vols. Chapman and Hall. London: 1846.

with taste. 'Chairs were placed on each side of the ruler, who occupied the head seat. Our party were placed on one hand; on the other sat his brothers Mahammed and Macota, and some other of his principal chiefs; whilst immediately behind him, his twelve younger brothers were seated. The dress of the rajah was simple, but of rich material, and most of the principal men were well, and even superbly dressed. His countenance is plain, but intelligent, and highly pleasing; and his manners perfectly elegant and easy. His reception was kind, and, I am given to understand, highly flattering. We sat, however, trammelled with the formality of state, and our conversation did not extend beyond kind inquiries, and professions of friendship. We were presented with tobacco rolled up in a leaf, each about a foot long; and tea was served by attendants on their knees. A band of music played wild and not unmusical airs during the interview, and the crowd of attendants who surrounded us were seated around in respectful silence. After a stay of half an hour, we rose and took our leave.' To this visit Muda Hassim had of course to make a return, which he did with much barbaric pomp and etiquette. 'His sword, with a gold scabbard, his war shield, jewel-hilted kris, and flowing horse-tails, were separately carried by the grand officers of state. Bursts of wild music announced his exit. His fourteen brothers and principal pangerans surrounded him, and a number (formidable on the deck of a vessel) covered the rear. He stayed two hours and a half; ate and drank, and talked with great familiarity, till the oppressive heat of the cabin caused me to wish them all to another place. However, he departed at last, under a salute of twenty-one guns, and the fatigues of the day were satisfactorily brought to a close. I afterwards sent the rajah the presents I had brought for him, consisting of a silk sarong, some yards of red cloth and velvet, a pocket pistol, scissors and knives, with tea, biscuits, sweetmeats, China playthings, &c. &c.' The inferior chiefs were also presented with a few articles; and nothing was more acceptable than small looking-glasses, before which some of the lower orders, quite ignorant of the reflection, were continually laughing, moving, sitting and rising, to observe the corresponding effect.

All this ceremonial over, Mr Brooke proceeded to business; and the first point was to receive permission to visit the interior. This being readily conceded, the boats were next morning launched, and a native prahu, with a crew of Malays, attended the party. The country is described as fertile beyond conception. At short distances, little clusters of native houses studded the banks of the river. The verdant jungle reached to the water's edge, and on the cleared spots clumps of trees arose, which would be the pride of any park in Europe. Monkeys, in great numbers, frisked among the branches; deer and wild hogs were abundant; and on one occasion the attendant pangeran treated them to a deer-hunt after the native fashion. By day they pulled up the river, wondering and admiring; by night they lodged in the best house of the nearest village, broiled their venison on a stick, flavoured it with a glass of sherry, smoked their cigars, and laid their heads on the pillow with as entire a feeling of security as though reposing in England. A description of one of these village dwellings, situated some sixty miles inland, is given as a novelty. 'Built,' says Mr Brooke, 'like other Malay houses, on posts, floored with split bamboo, and covered with the leaf of the Nepa palm, it presents the very *beau idéal* of fragility, but affords at the same time many advantages, and, with a little improvement, might be rendered admirably calculated for a new settler in any warm country. It is built at very small expense, is remarkably roomy, free from damp, and weather-proof. The interior of the house consists of four rooms: the centre one large and commodious; the front narrower, but thirty-six feet in length; a family sleeping-apartment on one side; and a kitchen at the back. These apartments are divided one from the other by partitions made of the Nepa; the floors were nicely spread with strong mats of Dyak manufacture, and on our arrival, finer white mats were laid over those. The entrance of the house is approached by a steep ladder, which, in case of attack, is easily removed.'

Having returned to Sarāwak, the next step was to take a survey of the neighbouring coast, and to run up the navigable rivers as far as possible. In this operation Mr Brooke had every facility given him by the rajah, had an escort of native boats, and accompanying pangerans. Among the most interesting rivers visited was that of the Lundu, a stream half a mile wide at its mouth, and 150 yards off Tungong, a Dyak village, situated about eighteen miles in the interior. The description of this village and its inhabitants, the Sibnowan Dyaks, forms one of the most interesting novelties in the journal. 'Tungong stands on the left bank (going up), close to the margin of the stream, and is enclosed by a slight stockade. Within this defence there is *one* enormous house for the whole population, and three or four small huts. The exterior of the defence, between it and the river, is occupied by sheds for prahus, and at each extremity are one or two houses belonging to Malay residents. The common habitation, as rude as it is enormous, measures 594 feet in length; and the front room, or street, is the entire length of the building, and 21 feet broad. The back part is divided by mat-partitions into the private apartments of the various families; and of these there are forty-five separate doors, leading from the public apartment. The widowers and young unmarried men occupy the public room, as only those with wives are entitled to the advantage of separate rooms. This edifice is raised twelve feet from the ground, and the means of ascent is by the trunk of a tree with notches cut in it—a most difficult, steep, and awkward ladder. In front is a terrace fifty feet broad, running partially along the front of the building, formed, like the floors, of split bamboo. This platform, as well as the front room, besides the regular inhabitants, is the resort of pigs, dogs, birds, monkeys, and fowl, and presents a glorious scene of confusion and bustle. Here the ordinary occupations of domestic labour are carried on—padi ground, mats made, &c. &c. There were two hundred men, women, and children, counted in the room and in front whilst we were there in the middle of the day; and allowing for those abroad, and those in their own rooms, the whole community cannot be reckoned at less than four hundred souls. Overhead, about seven feet high, is a second crazy storey, on which are stowed their stores of food, and their implements of labour and war. Along the large room are hung many cots, four feet long, formed of the hollowed trunks of trees cut in half, which answer the purpose of seats by day and beds by night. The Sibnowan Dyaks are a wild-looking, but apparently quiet and inoffensive race. The apartment of their chief, by name Sejugah, is situated nearly in the centre of the building, and is larger than any other. In front of it nice mats were spread on the occasion of our visit, whilst over our heads dangled about thirty ghastly skulls, according to the custom of these people. The chief was a man of middle age, with a mild and pleasing countenance, and gentle manners. He had around him several sons and relations, and one or two of the leading men of his tribe; but the rest seemed by no means to be restrained by his presence, or to show him any particular marks of respect—certainly not the slightest of the servile obsequiousness observed by the Malays before their prince. Their dress consists of a single strip of cloth round the loins, with the ends hanging down before and behind; and a light turban, composed of the bark of trees, round the head, so arranged, that the front is stuck up, somewhat resembling a short plume of feathers. Their figures are almost universally well-made, and showing great activity, without great muscular development; but their stature is diminutive, averaging from four feet ten to five feet four inches.'

Respecting the custom of adorning their houses with

skulls, Mr Brooke is inclined to regard it merely as a triumphant token of valour in the fight or ambush, similar to the scalps of the North American Indians, and not as evidence of a cruel and indiscriminate barbarity. 'On inquiring, I was told that it is indispensably necessary that a young man should procure a skull before he gets married. On my urging them that the custom would be more honoured in the breach than in the observance, they replied that it was established from time immemorial, and could not be dispensed with. Subsequently, however, Sejugah allowed that heads were very difficult to obtain now; and a young man might sometimes get married by giving presents to his ladye-love's parents. At all times they denied warmly ever obtaining any heads but those of their enemies; adding they were bad people, and deserved to die. I asked a young unmarried man whether he would be obliged to get a head before he could obtain a wife. He replied "Yes." "When would he get one?" "Soon." "Where would he go to get one?" "To the Sarebus river." I mention these particulars in detail, as I think, had their practice extended to taking the head of any defenceless traveller, or any Malay surprised in his dwelling or boat, I should have wormed the secret out of them.'

Of the general habits and mode of life among the Sibnowan Dyaks, Mr Brooke gives the following interesting synopsis, which, with little alteration, may be taken as a fair picture of the numerous tribes that form the native population of Borneo. 'The men of this tribe marry but one wife, and that not until they have attained the age of seventeen or eighteen. Their wedding ceremony is curious; and, as related, is performed by the bride and bridegroom being brought in procession along the large room, where a brace of fowls are placed over the bridegroom's neck, which he whirls seven times round his head. The fowls are then killed, and their blood sprinkled on the forehead of the pair, which done, they are cooked, and eaten by the new-married couple alone, whilst the rest feast and drink during the whole night.—Their dead are put in a coffin, and buried: but Sejugah informed me that the different tribes vary in this particular; and it would appear they differ from their near neighbours the Dyaks of Lundu. Like these neighbours, also, the Sibnowans seem to have little or no idea of a God. They offer prayers to Biedum, the great Dyak chief of former days. Priests and ceremonies they have none: the thickest mist of darkness is over them; but how much easier is it to dispel darkness with light, than to overcome the false blaze with the rays of truth! The manners of the men of this tribe are somewhat reserved, but frank; whilst the women appeared more cheerful, and more inclined to laugh and joke at our peculiarities. Although the first Europeans they had ever seen, we were by no means annoyed by their curiosity; and their honesty is to be praised, for, though opportunities were not wanting, they never on any occasion attempted to pilfer. Their colour resembles the Malay, and is fully as dark; and the cast of their countenance does not favour the notion that they are sprung from a distinct origin. They never intermarry with the Malays, so as to intermingle the two people; and the chastity of their women gives no presumption of its otherwise occurring. Their stature, as I have before remarked, is diminutive, their eyes are small and quick, their noses usually flattened, and their figures clean and well-formed, but not athletic. Both sexes generally wear the hair long and turned up, but the elder men often cut it short. As is natural, they are fond of the water, and constantly bathe; and their canoes are numerous. I counted fifty, besides ten or twelve small prahus, which they often build for sale to the Malays, at a very moderate price indeed. The men wear a number of fine cane rings, neatly worked (which we at first mistook for hair), below the knee, or on the arm, and sometimes a brass ring or two; but they have no other ornaments. The ears of a few were pierced, but I saw nothing worn in them except a roll of thin palm leaf, to prevent the hole closing. The women are decidedly good-looking, and far fairer than the men; their figures are well-shaped, and remarkable for their *embonpoint*. The expression of their countenance is very good-humoured, and their condition seems a happy one. Their dress consists of a coarse stuff, very scanty (manufactured by the Sakarran Dyaks), reaching from the waist to the knee; around the waist they have rings of rattan, either black or red; and the loins are hung round with a number of brass ornaments, made by their husbands. Above the waist they are entirely naked, nor do they wear any covering or ornament on the head. They have a few bracelets of brass, but neither ear-rings nor nose-rings; and some, more lucky than the rest, wear a necklace of beads. They prefer the smallest Venetian beads to the larger and more gaudy ones of England. The labour of the house, and all the drudgery, fall upon the females. They grind the rice, carry burdens, fetch water, fish, and work in the fields; but though on a par with other savages in this respect, they have many advantages. They are not immured; and eat in company with the males; and in most points hold the same position towards their husbands and children as the European women. The children are entirely naked; and the only peculiarity I observed, is filing their teeth to a sharp point, like those of a shark.'

Having surveyed a considerable portion of the coast, and ascended several of the rivers, to the distance of thirty, fifty, and eighty miles, Mr Brooke returned to Sarāwak, with a pretty accurate knowledge of the nature and capabilities of that portion of Borneo. He found that gold, tin, copper, antimony ore, porcelain clay, coal, and iron, were amongst its mineral productions; that timber fit for ship-building, aloes wood, ebony, canes, rattans, wild nutmeg and other spices, were everywhere in abundance; and that sago, rice, edible birds' nests, bees'-wax, &c. might also be made profitable sources of commerce. These matters he urged upon the attention of the rajah, represented to him how much his country would be benefited by a trade with Sincapore, and so far convinced him of the benefits to be derived from such procedure, that Mr Brooke's subsequent success may be said to have been then founded. After a few days' rest and refitting, he bade a temporary adieu to Muda Hassim and Sarāwak, and the Royalist dropped down the river on her course to Sincapore.

THE LIE OF EXPEDIENCY—A TALE.

BY ANNA MARIA SARGEANT.

'To what happy event am I indebted for this early visit?' asked Mr William Matthews, addressing his nephew, who with a light step, and countenance radiant with smiles, entered his little breakfast parlour.

'My master having given me a holiday, my good uncle,' was the young man's reply.

'Why,' rejoined the old gentleman, 'you seem as pleased as a schoolboy who has not had a holiday from midsummer till Christmas; but come, sit down,' he added, ringing the bell for an additional coffee-cup; 'I daresay you are ready for breakfast after your walk from town; for I presume that you did not ride?'

'No, sir, I did not ride; nevertheless I am neither tired nor hungry.'

'Neither tired nor hungry after a walk before breakfast of more than eight miles! Well, I can only account for this circumstance by supposing your thoughts to have been very agreeably occupied, which supposition, indeed, your smiles corroborate. Why, Gilbert, you are surely in love?'

'You have not guessed far from the mark,' rejoined his nephew, colouring a little; 'and, to own the truth, I am come to Richmond this morning for the express purpose of obtaining your sanction to my choice.'

Mr Matthews looked grave, and set down the cup of coffee he was just raising to his lips. 'You speak as if my sanction were a matter of course,' he remarked, dropping his strain of raillery; 'but I must hear more of this matter. A young man who is just out of his apprenticeship, and without the means to set up in business for himself, is not in a situation to think of a wife.'

'That is very true, my dear uncle; but Mr Williams has offered to set me up in business; and not only so, but to furnish my house.'

'Ho! ho! it is your master's daughter you are aiming at?' Matthews exclaimed, opening his eyes wide with astonishment. 'How comes it that I have never heard of this before?'

'Why, uncle, I was not certain, till very lately, that I should be accepted by the young lady; that was the reason.'

'And which of the girls has charmed you into the desire to become a Benedict; for, if I recollect right, there are three?'

'Annie, the second daughter, who, you may perhaps remember, is the prettiest.'

'Not I,' rejoined the old gentleman laughing; 'I did not take sufficient notice; but I trust that you have not chosen the girl for her beauty, and failed to look for those qualifications which are far more important in a wife?'

'Beauty is Annie Williams's least attraction, I assure you, sir,' the young man interposed; 'but I thought that the information that she was the handsomest, might bring her to your recollection better than either her name or age.'

'We may differ in our ideas of female loveliness,' remarked the uncle; 'but it is natural for you to imagine the lady of your choice to be the most beautiful. Well, well, I don't know whether it may not be best for a man to marry in his youth,' he proceeded after a brief pause. 'I can't say but that I have wished that I had done so; though it may be better for you and your brother that I did not. I am not a bachelor exactly from choice, and I don't advocate the state.'

Mr William Matthews was a tradesman, who, having amassed sufficient property in business to retire somewhat early in life, had for the last seven years enjoyed it in a picturesque little cottage on the banks of the Thames, in the vicinity of Richmond; and James and Gilbert Faulkland were the sons of a sister, lately deceased, who had spent eighteen years of widowhood beneath his hospitable roof. He was universally looked upon as a just and upright man; but by some was deemed penurious, because he did not expend his money so freely upon his nephews as they imagined that he, under the circumstances, ought to have done. The truth was this. Mr Matthews was one of those old-fashioned tradesmen who had risen to competence by his own good conduct and industry, having commenced in the very lowest department of his business; and he was of opinion that young men were more likely to succeed who depend upon their own resources. In accordance with this notion, rather than from any selfish desire to expend his money upon himself, he had put them in a way of earning their own living, by apprenticing them to the trades they respectively made choice of. James had already, he said, given proof of the wisdom of his plan, having conducted himself in such a manner as to be received by his late masters as a junior partner in the firm. Gilbert, however, was of a character less decided: his virtues were of the negative order. He was neither dissipated nor idle, but he wanted that moral courage which is essentially necessary in the pursuit of independence; and though, from some cause scarcely known to himself, his uncle regarded him with a stronger affection than his brother, yet he far oftener fell under his rebuke.

The result of the above conversation was the speedy marriage of the young people; for Uncle Matthews, though usually an enemy to precipitance, was in this instance easily won to consent. It was the old gentleman's wish to be formally introduced to the bride-elect; but as one of his frequent fits of gout confined him to his own residence during the season of preparation for the nuptials, and as his nephew, from some cause, did not bring his 'ladye love' to visit him, he was obliged to forego that pleasure. No sooner, however, were the young couple settled in their new abode, than, being a little recovered, he made known his intention of becoming for a few days their guest.

'Annie, my love,' cried the husband, addressing his fair bride on the evening of the day in which he received the communication, 'you must set your house in apple-pie order to-morrow;' and he placed his uncle's letter in her hand as he spoke. Annie smiled, and glanced at the contents with evident satisfaction.

'I shall be pleased to receive any relative of yours, my dear Gilbert,' she affectionately said; 'but, above all, one of whom I have heard such an excellent character.'

'Uncle Matthews is justly dear to me, if only for the kind part he acted towards my mother,' the young man rejoined; 'but he's an oddity—one of those persons whose favour a very slight matter may deprive you of.'

'Indeed? I had imagined otherwise, from his undeviating kindness to you and your brother.'

'My brother has always been careful not to offend him,' Gilbert returned; 'but, from the fact of my having less caution, I have more than once jeopardised my interest in his will.'

'The forfeiture of the esteem of such a man would, I think, give me far more concern than any pecuniary loss I might sustain,' Annie interposed a little reproachfully. Gilbert felt the reproof, and quickly rejoined that, for his own sake, he was perfectly indifferent to the possession of wealth, and that it was for her alone he desired it.

The conversation dropped for the present; but it was resumed by the husband ere the evening had elapsed. 'Annie,' he said with an evident effort at composure, 'I have a caution to give you connected with my uncle's visit.'

'A caution!' the young wife repeated, whilst a smile played upon her ingenuous countenance; 'you need not, dear Gilbert, be under any apprehension that I shall offend; I am too predisposed to love him.'

'I am under no apprehension of that kind,' he made answer, and Annie now for the first time observed his agitation; 'but you may unwittingly bring me into such disgrace, that I shall never regain his favour.'

'How? You alarm me, Gilbert, by the bare supposition.'

The young man hesitated. 'I shall incur your censure, Annie,' he at length faltered forth; 'but I must tell you that I have practised a little deception, in order to obtain his consent to our union.' Annie did not reply, but the look of deep distress which overspread her usually placid features could not escape his observation. 'Dearest Annie,' he exclaimed, encircling her form, which seemed sinking under the distressing information his last sentence had conveyed, and drawing her towards him with tenderness—'dearest Annie, do not alarm yourself thus; I am not about to confess myself guilty of any very heinous offence: it was but a "white lie."' Still Annie spoke not. 'Uncle Matthews has been a kind friend to my family, as well as to myself, and I am grateful for the services he has rendered us; but I am not, on that account, blind to his one failing, which is the parsimonious spirit which he denominates prudence. I knew that it would be useless to talk to

him of beginning the world on credit, even though the creditor be my wife's father, and I just led him to believe that Mr Williams furnished this house, and set me up in business, in the room of a marriage portion for you: that is all, Annie, so you need not look so terrified.'

'And you wish me to corroborate these false statements?' the young wife, in breathless agitation, inquiringly rejoined.

'To be sure I do; that is, if my uncle should make any allusion to the subject. It is scarcely likely; yet he may do so; for he is not very delicate in such matters, and it is better to be upon your guard.'

'Oh, Gilbert,' she exclaimed, bursting into tears, 'you have imposed a task on me from which I shrink with abhorrence. I have been taught to regard truth as the basis of all moral good. My departed mother's dying injunction was, that I and my sisters should never, in the slightest degree, swerve from it; and I would sooner be deprived of a fortune, than thus act against my conscience.'

'Then you will selfishly entail all the ignominy on me!' the husband exclaimed, suddenly relinquishing his hold, and rising from his seat in anger. 'My love for you has brought me into this dilemma, and you heartlessly leave me to reap the consequences! I did not expect this from one who professed such affection for me,' he almost fiercely added, as he threw himself into a chair, and covered his face with his hands.

This was the bitterest moment poor Annie had ever known. With the exception of the loss of her excellent maternal parent, her life had been one of sunshine, and she had commenced her new duties with all the hope and trust of an ingenuous and loving spirit. She had hitherto seen but the bright side of her husband's character; she had heard her father commend his industrious and steady conduct; she had herself witnessed his affection for his mother and brother; and she knew him to be kind-hearted and generous. Of the strength of his principles she had had no opportunity of judging, and she had taken it for granted that he was all she could desire in that respect. The discovery the last few moments had made, that he could be guilty of a premeditated falsehood, and afterwards try to palliate, if not vindicate the act, by the miserable subterfuge of its expediency, now brought a blight upon her young heart: yet reproach him she would not, though she felt that her happiness was wrecked; for what confidence could she place in one on whose word she could not rely?

With different feelings did the young wife now prepare for the reception of her expected guest; and instead of the affectionate warmth with which she would have greeted him, there was a constraint in her manner altogether foreign to her nature, but which she in vain endeavoured to overcome. Her attentions were, however, unremitting during his stay; and so gratified was the old gentleman with her unostentatious kindness and efforts to please, notwithstanding her reserve, which he generously set down to girlish timidity, that he protracted the visit to a fortnight which he had intended to be for only a few days. No words can express the anguish Annie endured during that period: she every day feared some reference to the subject which so entirely engrossed her thoughts. She dared not ask his opinion on any matter which could in anyway lead to the dreaded topic, and a flush of crimson would often suffuse her cheek at an imaginary allusion to it. At length Mr Matthews fixed a day for his departure; and his young hostess, who, under different circumstances, would have been delighted to detain him as her guest for a longer period, inwardly rejoiced at the announcement, thinking it would relieve her mind, at least for the present, of a heavy burden. As a stage-coach for Richmond passed the door early in the evening, the old gentleman resolved to wait for it, saying that he had some little business to attend to in the course of the afternoon. Annie, with her wonted thoughtful kindness, proposed making him an early tea; which offer he smilingly accepted, observing to his nephew, who was rising from the dinner table to return to his business, which was at some distance from his dwelling-house, that it would give him an opportunity of drinking tea *tête-à-tête* with his fair hostess.

'Here's a parcel from a linen-draper directed to you, ma'am,' cried Mrs Faulkland's little handmaid, as she entered the parlour just as her mistress and her visitor had finished the social evening meal.

'It can't be for me,' Annie returned, rising as she spoke to examine the direction, 'for I have not ordered anything of the kind.'

'It's quite right, Rachel,' interposed Uncle Matthews with one of his benevolent smiles; 'it is for you, my dear girl, though you have not ordered it; that is, if you will accept of it from the hands of an old bachelor: and now let me have the pleasure of seeing you open it.'

You are always performing some act of kindness, sir,' Annie observed as her nimble fingers began to untie the knotted string with which the packet was bound.

'Ah, that is just as I hoped,' the old gentleman hastily exclaimed, familiarly patting her on the shoulder; 'you little think, perhaps, how I watch you, nor from what apparently small matters I draw my conclusions. Had you seized the scissors, which were just at hand on your work-table, to cut the twine, instead of setting your fingers to work to untie it, I should have set you down for an extravagant little jade, notwithstanding all your show of economy.'

'That would have been drawing rather a hard conclusion; for the eager desire we ladies are said to have for the possession of new articles of dress, might have pleaded an apology, I think, for the use of the scissors.'

'No, no, it would not,' he pertinaciously returned; 'a careful woman is careful at all times, even from habit. You have convinced me, by this little act, that you are a fitting wife for a young tradesman, and you well deserve this trifling testimony of my regard;' and as he spoke he unfolded the paper, displaying a roll of rich figured silk, together with a variety of ribbons and laces. 'I hope I have pleased you in my choice of colours?' he pursued; 'I have not had much occasion to exercise my taste in the selection of female gear, but I have done my best, and we will have a light to examine them.'

'I cannot be otherwise than pleased with whatever you do or say, my dear uncle.'

'Don't be so certain upon that head,' he exclaimed as he reseated himself beside the fire. 'I am about to ask you a question which you will perhaps deem rude; but I am not prompted by idle curiosity, which I will prove to you when you have answered me.'

It was well for poor Annie that the candles were not yet introduced, or her agitation would have been palpable to her guest, though she, with forced composure, replied that she was ready to answer any question he might think proper to put to her.

'Well, my dear,' he resumed, drawing her affectionately into a chair by his side, 'I wish you to treat me with the same confidence as you would your father. I already regard you in the light of a daughter.'

'You have ever acted as a father towards my husband, and I should love you if only for your goodness to one who is so dear to me, Annie returned with emotion.

'That is a pretty wifely speech; but as my time is brief, I must be concise, and to the point, for I am desirous of satisfying my mind before I go. The question I wish to ask you, my dear girl, is this—did your father furnish your house, and set your husband up in his present business?'

The dreaded moment had come; the question she had so long endeavoured to parry was asked; still it was put in such words as not to call forth a *positive* falsehood, if replied to in the affirmative; for her father had furnished the house, had set her husband up in business; though the money was to be returned by quarterly

instalments from the profits. She faltered forth, '*He did.*'

'In lieu of a marriage-dower for you, my dear Annie?'

Had not the darkness prevented, her guest would have perceived the fearful struggle pictured in those features which had ever been an index to her heart, and that she was giving utterance to a falsehood as she uttered the little monosyllable 'Yes.'

'It is enough,' Mr Matthews exclaimed; 'I can rely upon *your* word; though, to confess the truth, I had reason to suspect that Gilbert had misrepresented the affair. I am happy, however, to find that it is not so.

What would Annie have given at that moment to have thrown herself at the feet of her aged friend and acknowledged the deception. Such was the course her feelings and her conscience prompted. But the bitter words which had escaped her husband's lips when she had indirectly reproved him by asserting her own love of truth, still rung in her ears, and she could not summon courage to make known his delinquency. Had time been given her for consideration, her better feelings would probably have obtained the mastery; but Mr Matthews now rose hastily to prepare for departure, observing that the stage would be at the door before he was ready; and Annie's confusion and trepidation were unnoticed, as she busily occupied herself in helping him to put on his greatcoat, and tying the warm cravat around his neck. After ejaculating a hearty benison, he departed, leaving the unhappy girl in a state of torture even greater than that she had before endured. She re-entered the parlour, and putting aside the testimony of his affection with a sickening heart, threw herself upon her knees and sobbed violently. She felt she dared not ask the Almighty's forgiveness of a sin which she must still conceal from the knowledge of him against whom it had been committed. Poor Annie had, from the commencement, pursued the wrong course. Her conscience had prompted the plain path of duty; but timidity, and a false estimate of the duty she owed to her husband, had led her into a devious path, from which it was now difficult to extricate herself. She had not dared to premeditate the utterance of an untruth; but she left herself without that Omnipotent aid which was never yet implored in vain, erroneously trusting to the impulse of the moment, when she ought to have strengthened her mind for the exigence by prayer. Gilbert returned from his accustomed occupation, and as his wife had by that time regained her self-possession, he guessed not the trial she had for his sake endured. The evening passed without any allusion being made to the subject; but from that hour Annie Faulkland was an altered being. The naïveté which had once given such a charm to her manners, was exchanged for a morbid melancholy, for which no one could account, and which undermined her health. She had now lost her own self-respect, and with it her happiness. There was no one—her husband scarcely excepted—who was more concerned in her declining state than was Uncle Matthews. He, from the period of his first visit, had conceived a warm attachment for her, which had strengthened with each succeeding interview. He little imagined, as he addressed her with paternal tenderness, that his presence augmented her sufferings, and that the apprehension of the discovery of the duplicity made her dread his affectionate glance, and tremble at his approach. Three years thus passed, and the debt which Faulkland had contracted was now liquidated. Mr Matthews had liberally contributed a considerable sum to aid him in his business, and this had enabled the young man to defray the debt sooner than he had expected. To his credit it should be told, that he was scrupulous in denying himself any article of luxury till it was cancelled—a line of conduct in which his wife warmly concurred.

The duties of a mother now devolved on our young heroine; and this delightful task served for a time to wean her thoughts from the all-absorbing subject. Her bodily health did not, however, improve; and after the birth of her second child, the symptoms of incipient consumption became too evident to be mistaken. Every means which affection could devise, or money could purchase, was resorted to in order to check the progress of the disease. There were times when the patient experienced so much apparent benefit, that her relatives entertained hopes of her ultimate recovery: but these hopes proved only a delusion. The sure termination of that devastating malady, which has, till of late, been deemed incurable, came at last, and cut off the fair young wife from the midst of her little domestic circle, in her five-and-twentieth year.

The invalid had, in compliance with Mr Matthews's express desire, been removed to his cottage at Richmond, and it was there that she breathed her last sigh. Her decay had been gradual; and her end was so peaceful, that no apprehensions that she was worse than usual were entertained on the morning of the day of her death, when her husband was obliged to leave her to repair to his business in town. The evening came—it was a tranquil summer's eve—and she was placed, at her own request, on a couch before her chamber window, that she might catch a view of the noble river and the beautifully-diversified prospect beyond. Mr Matthews was at the time confined to his own apartment by one of his attacks of gout. Mary Williams, who, during her sister's protracted illness, had become her attentive and devoted nurse, had, worn out by solicitude, been persuaded by Annie to retire for a short time to rest. She was therefore left with her little son, a boy of five years old, who had begged permission to watch by her side, promising to be very quiet, if allowed to do so. 'James,' she feebly said, addressing the child when they were alone, 'you will soon lose your poor mother; but you must be a good boy, and be a comfort to your dear father, and a protector to your little sister.'

'You must not die—you shall not die, mamma!' the child passionately interrupted her by exclaiming; and he rose as he spoke from the little stool on which he had been seated by her side.

'Nay, my dear, I must die; it is God's will, and we ought not therefore to murmur; but I wish to say a few words to you, which you must promise me never to forget. You are very young, James; and if you don't repeat them every day, they may perhaps escape your memory. Will you promise me to do this?'

'Oh yes,' the child sobbed forth; 'but I am sure I shall never forget anything you have said to me, my dear, good, best mamma.'

'Don't call me good, my love,' the mother returned, whilst the hectic flush upon her cheek grew deeper; 'I am about to tell you something which will let you know that I am not good; but I make it known because I hope it may save you from falling into a similar fault. I once told a lie, James. It was not a lie that would do anybody any harm, and I told it to prevent one I dearly loved from being thought ill of: but it was wicked, and I have never been happy since the day I was guilty of it.' The boy looked up in amazement. 'You may well look surprised, my sweet child,' the invalid pursued, pressing him to her heart with a maternal embrace. 'I have always taught you to tell the truth, and I will teach you with my dying breath. My very death is a lesson for you; for I am the victim of a deviation from truth. I might have died now, if I had never told a falsehood,' she resumed after a brief pause; 'but I believe that I should not. It has preyed upon my mind, injured my health, and hastened, if not positively caused, my death. Do not weep, my love; God has, I trust, forgiven me that and all my other offences, and will take me to himself. But it is my wish that you repeat these words every morning when you rise, and teach your little sister Annie to do the same—"*My mother intreated me with her dying breath never to tell a lie.*"' Exhausted with the effort, she sunk back upon the scroll of the couch, from which she had partially arisen, and a few hours subsequently her gentle spirit took its flight from earth.

Mrs Faulkland's death was deeply felt in the domestic circle where her unostentatious virtues had been called into action; but the effect it produced differed according to the characters of the bereaved. Mr Matthews, though experiencing a pang equal to what the loss of a dutiful and affectionate daughter would have inflicted, bore it with the Christian fortitude which had at all seasons distinguished his conduct. Not so, however, the husband. Through the progress of the disease he had pertinaciously clung to the hope of his wife's ultimate restoration—a hope which was rather founded on his wishes than on his judgment; and when the blow came, he felt it with tenfold severity. His naturally weak mind was so completely enfeebled by the event, that great fears were entertained by his anxious family lest he should sink into absolute imbecility. Annie, a sprightly little creature of scarcely three years old, was too young to have any conception of the loss she had sustained. With her the tear was 'forgot as soon as shed;' but James, who was naturally more thoughtful than his sister, was not only powerfully affected at the time, but experienced a change which influenced his character through his after-life. Miss Williams generously devoted herself to the care of the motherless children; and time, that great soother of grief, at length restored Gilbert Faulkland almost to his usual cheerfulness. Uncle Matthews was so fondly attached to his second generation of nephews and nieces, as he facetiously termed them, that he would gladly have detained them as constant inmates of his cottage, had he not been unwilling to deprive their father of the consolation their presence afforded him. Little Annie, in particular, delighted him with her sportive sallies. She grew the counterpart of what her departed mother had been in extreme youth, both as regarded the simple beauty of her face and form, and the naïveté of her manners. The latter years of the parent had been embittered by one false step, which had cast a gloom over her otherwise buoyant spirits; but there was yet no sad circumstance to overshadow the sunshine of her innocent and happy child. Though Annie was the pet and plaything of her aged relative, he took no less interest in the welfare of her brother, who early discovered an energy and strength of character which afforded him the highest satisfaction. As his years increased, he became of great service to his father, whose once prosperous business had declined whilst he was suffering so severely from his domestic affliction. When scarcely twelve years of age, any errand which required punctuality and prudence was confidently intrusted to him; and Faulkland contemplated having him duly apprenticed, and afterwards taking him as a partner in his business.

The father was one day giving his son directions respecting some important commercial transaction, when, after explaining the whole affair, he concluded by saying that he must by no means let the parties to whom he was sent know that he was privy of the concern.

'But Messrs Smithson and Jones know me to be your son, and might try to draw some information from me,' the boy interposed.

'Then you must say that you don't know anything of the matter,' Faulkland quickly rejoined; but scarcely had these words passed his lips, ere he heartily repented of having suffered them to escape him; for the look of astonishment and deep concern which marked the expressive features of his child, made him truly ashamed of the counsel he had given him.

'Father,' James solemnly returned, 'I would not utter an untruth to gain a fortune.'

'No, that I am sure you would not, after teaching me to repeat dear mamma's dying words every day for so many years!' exclaimed Annie, who had hitherto been a silent, but not unattentive observer of what was passing between her father and brother.

'What do you say, my child?' Faulkland eagerly demanded, catching his little girl by the hand, and drawing her towards him. Annie hung down her head and blushed. 'What does she mean, James?' he further demanded in extreme agitation; for a vague recollection of an event which had long ceased to dwell in his memory crossed his mind at this moment. The boy did not answer. 'I command you to tell me what she means,' Faulkland vociferated in a tone unlike that with which he was wont to address his children, and his whole frame was convulsed as he spoke. 'As you profess to be so scrupulous with regard to truth, I desire that you conceal nothing from me.'

'Dear father,' returned the boy, though scarcely able to articulate the words for the rising tears which his parent's unusual severity had called forth, 'it was for your sake I hesitated; but since you command, it is my duty to obey, however the information may pain you.'

'Say on,' Faulkland exclaimed, with a forced effort at composure, which really alarmed the trembling girl, whose hand he still held. James had hitherto concealed the last communication of his dying mother from his remaining parent; because, young as he then was, he had surmised that his father was the person for whom the sacrifice of truth had been made. He had likewise laid a strict injunction on his sister to keep it a secret, which injunction she had inadvertently disregarded. But thus called upon, he now, without hesitation, repeated the whole of a conversation which had been too deeply graven on his memory ever to be erased. Faulkland listened like one bewildered. Never till this moment had he even vaguely imagined the powerful influence this breach of veracity had had upon his gentle and devoted wife; he had never even questioned her as to whether she had confirmed his statements or not. Her prompt exclamation of disapproval on the evening on which he had proposed it, gave him reason to expect the latter; but he had subsequently conjectured the former to be the case, from a remark his uncle had once made on the subject. If the loss of his affectionate and deservedly-beloved partner had preyed upon his mind, when he believed himself to have done all a tender husband could do for her restoration, how was he overwhelmed by this second stroke! He did not speak, but, casting upon his children a look of unutterable anguish, rushed to the solitude of his chamber, where, falling upon his knees, he bitterly accused himself of having been the means of bringing his lovely and amiable wife to a premature grave, and of bereaving his children of their best and ablest protector. Meanwhile poor Annie would have given worlds to recall the words she had so unthinkingly uttered; and James, by turns, wept with and strove to comfort her.

The result of the aggravated renewal of Faulkland's grief was a return of his mental malady, from which he did not recover till within a few hours of his death, which took place some months subsequently. Weakness of character had distinguished him from childhood, though the early training he had received from his excellent mother, and the example of his firm-minded uncle, had saved him from falling into gross vices. This weakness had bowed down his manhood, and finally brought him to the grave. He spent the lucid interval given him in preparing his mind for that change which he now became fully aware was drawing near; and the consolation which religion yields, and the hopes it inspires, could alone animate his crushed spirit in this trying hour.

On Uncle Matthews once again devolved the office of fostering unprotected youth; and though age might have been pleaded as an excuse for his personal exertions in a matter of such importance, he shrunk not from the arduous task. Towards the orphan children of Gilbert Faulkland he performed a father's part, as he had done twenty years previously towards their parent; and thus even his declining days were gilded by active benevolence.

The sad events which had made such a chasm in the domestic circle were never forgotten by the survivors; but after the first ebullition of grief was past, the elastic spirits of youth returned to chase away the gloom, leaving only the deeply-rooted lesson on the heart, that

a firm adherence to truth is the surest road to peace of mind; and that the slightest deviation from its narrow path—however it may be palliated and glossed over by the plea of expediency—is essentially wrong, and will in most instances work out its own punishment.

PASSAGE OF THE STRAHLECK.

[The following account of this interesting excursion is translated from a French work by M. Desor, on the Glaciers of the Higher Alps.]

We had already (says M. Desor) been domiciled above a week in our solitary hut, on the surface of the glacier, when the idea occurred to us, that the moment was favourable for the realisation of our favourite project; namely, that of attempting the passage of the Strahleck, by traversing the sea of ice separating the inferior glacier of Grindelwald from that of the Finsteraar. The plan was no sooner broached than it was acted upon. Guides were chosen, provisions prepared, and the following morning was appointed for the undertaking. To our great disappointment, it dawned upon us in a manner anything but propitious, every surrounding object being enveloped in dense mist. Discouraging as this appeared to all parties, a ray of hope soon dawned upon us, on hearing our chief guide, Jacob Leuthold, declare that the rising sun would quickly dissipate the obnoxious canopy of fog which hung over us. Such was indeed the case: the black angle of the Finsteraarhorn soon began to appear; and we accordingly started, though still doubtful as to the realisation of our guide's prediction. Hardly had we accomplished a quarter of a league, when on a sudden the mists cleared away in a surprising manner, disclosing the summits of the Shreckhorn, Finsteraarhorn, Oberaarhorn, Altmann, &c. the peaks of which appeared as islands rising from this ocean of vapour, and glowing in the rays of the rising sun.

The time necessary to attain the foot of the Strahleck from our hut on the glacier had been estimated at three hours, and as the inclination of the glacier is at this point but slight, little difficulty occurs in traversing it. The crevasses were generally covered by a coating of snow, hardened by the previous night's frost, and, as such, presented no danger. On approaching the Strahleck, however, these crevasses became wider, and we perceived several of them twelve or fifteen feet in width. These were avoided; and on reaching the foot of the ascent, we proceeded to ascertain its most accessible portions. 'Is this, then, the much-dreaded pass of the Strahleck,' said Agassiz, 'from which so many have retreated?' We were, in fact, disappointed at its apparent want of elevation; whilst, on the other hand, experience had taught us that nothing can be more deceptive than heights and distances among the Alps. We now began the ascent, following closely in each other's footsteps; Jacob and Wahren leading the way, and carefully sounding the snow, lest any concealed crevasses should exist. Gradually the slope became steeper and steeper, and the snow so dry and incoherent, that we sank up to the knee at every step. Fearing, therefore, the occurrence of an accident, the guides considered it necessary to connect the whole party to one another by means of a long rope. Each person passed it round his own body; the guide Gaspard being the first, M. Agassiz the second, then myself, M. Coulon, and Pourtales, and, lastly, two guides. Jacob and Wahren remained unconnected with the rest of the party, in order to allow greater liberty in choosing the proper direction. In this position, it was astonishing to notice the circumspection and *sang-froid* displayed by these two hardy mountaineers — at one moment stamping under foot the soft snow, in order to prevent their followers from sinking too deeply; at another cutting out steps with a hatchet, and then encouraging us, by voice and gestures, to remain at an equal distance from one another, and not to look backwards—the view of the precipice being likely, in such circumstances, to produce giddiness, even in those persons who might not be liable to it on ordinary occasions. On so steep a slope, it is scarcely possible to ascend in a direct line, and our advance was consequently wavering and uncertain. We attained, however, in the space of an hour, the summit of the Col; and on looking backwards, we were almost terrified at the steepness of the ascent, which, seen from below, had appeared to us so little worthy of notice. Our chief guide then announced to us that, to his knowledge, the passage of the Strahleck had never before been accomplished in so short a space of time. The quantity of fresh snow which had lately fallen was in a great measure the cause of our success, by filling up the crevasses, which, had they not been covered, would have presented innumerable obstacles to our progress. On attaining the summit of the pass, we perceived at our feet the valley of Grindelwald, the Sheideck, the Faulhorn, the Stockhorn, the Niesen, bathed at its foot by the rippling waves of the Lake of Thun. In front rose the gigantic masses of the Eiger and Mönch, apparently in close proximity; a little to the south-west, the triangular summit of the Jungfrau appeared above the Viescherhornec; to the east, our view was limited by the Shreckhorn, which from this point presented a far less imposing aspect than when seen from our hut on the glacier.

The summit of the pass is a small plateau, covered with an unbroken coat of snow, and presenting no crevasses on its surface. We now proceeded to make a few observations with our instruments. The thermometer of Fahrenheit stood a little above the freezing-point, whilst the hygrometer of Saussure stood at 42 degrees, indicating an excessively dry state of the atmosphere. Our observations with the barometer gave us the height of the pass as 10,328 feet above the level of the Mediterranean.

The weather had now become perfectly serene, and the sky appeared of a deep blue, particularly in the zenith. There was also a peculiar elasticity in the atmosphere, tending to destroy any feeling of fatigue which the previous ascent might have produced. In fact our guides, in the exuberance of their spirits, began wrestling among themselves, when an incident occurred which instantly caused the most complete silence among the party. Jacob Leuthold had perceived chamois on the slopes of the Little Shreckhorn, and we now saw, for the first time, these beautiful animals in full liberty. We clearly discerned a female and one of her kids clambering towards the summit of a neighbouring peak. They soon disappeared, but quickly returned into sight in company with three males; and, by the slowness of their motion, we had a most favourable opportunity of examining them at our leisure through our telescopes.

It was now about ten o'clock A.M., and we again proceeded on our course towards Grindelwald; and as the slope of snow which lay before us was very steep, our guides proposed to us to slide down, taking the precaution to connect the party again by means of the rope. The propriety of this measure was soon manifest; for we had scarcely commenced our descent, when the snow receded from under our feet, and one of the party sank up to the breast in a crevass. Such was, however, the rapidity of our descent, that we had but little time to reflect on the consequences which might have ensued had the precaution previously mentioned been omitted.

After having thus slid down a considerable portion of the slope, its steepness gradually increasing, we were obliged to abandon our previous method of progression —the crust of snow frequently yielding considerably to our footsteps, and thus rendering our march wavering and slow. In addition to this inconvenience, my alpenstock slipped from my hand, and descending the slope with great rapidity, was lost in the crevasses of the glacier which lay at our feet.

We now directed our course towards the Zoesenberg, where, finding the steepness of the descent somewhat diminished, we again slid down with comparative faci-

lity over the frozen snow. I now learned, to my cost, the value of the mountain pole on such occasions; nothing, in fact, being more wearisome than the necessity of sustaining the erect posture whilst deprived of such a support. The muscles of the legs undergo excessive tension, and the difficulty of directing our course, or even of stopping it, when deprived of its valuable aid, was but too manifest. If by chance M. Agassiz, who preceded me, increased his speed, or M. Pourtales, who followed me closely, halted for a moment, the motion thus imparted to the rope was sufficient to extend me at full length on the surface of the snow. I repeatedly endeavoured to raise myself, intreating my companions to proceed more cautiously; they, however, were as little masters of their own movements as myself. These falls generally had the effect of implicating my two followers. Wearied at length by these continued mishaps, we determined to accomplish the remainder of the descent by sliding down at full length on the snow. We arrived thus in safety at the foot of the slope; the guides having previously stationed themselves, to prevent our striking against the rocks. Our chief guide now informed us that the worst was over; and having liberated us from the confinement of the rope, we again proceeded towards Grindelwald.

We now approached the glacier of the Eiger, which descends from the northern flank of the Viescherhornec: its inclination is very considerable, whilst in the centre of the glacier there is seen a rock, called by the natives the Heisse-Platte, which has never been invaded by snow or ice. In this portion of the glacier, during the year 1821, an accident of a fatal nature occurred to a Swiss clergyman named Mouron: whilst leaning on his pole, examining a crevass, its edges gave way, and he was precipitated headlong into the abyss: his mangled body was, after considerable difficulty, withdrawn from a depth of 121 feet, and carried by his friends to the parish church of Grindelwald, and there interred.

Having arrived at the foot of the slope, our course should have been directed towards the Zoesenberg, which lay to the left, or to the Mettenburg. The guides, however, advised us to follow the edge of the glacier, this being apparently the shortest route. But, on attempting to do so, difficulties of an insurmountable character straightway presented themselves. The crevasses suddenly became so numerous, that we were forced to regain the right border of the glacier by scaling its vertical walls of rock. Hardly, however, had we proceeded a short distance on these rocks, when fearful precipices opened upon our view. Driven again, by necessity, to descend upon the surface of the glacier, we proceeded to seek for a passage among the masses of ice and gaping crevasses. The difficulty of accomplishing this, caused us to despair of attaining the termination of our journey; and we were on the eve of retracing our footsteps, when our guides informed us that we were within a short distance of Grindelwald. This welcome news revived our drooping courage; and after a few more efforts, we discovered a gulley in the rock by which the descent upon the glacier might be accomplished. Proceeding farther, we had an opportunity of witnessing one of the most beautiful phenomena afforded by the glaciers. An immense mass of ice, having become detached from one of the lateral clefts on the glacier of the Eiger, fell with terrific violence on the glacier of Grindelwald. The avalanche lasted for several minutes, bounding down the slope until it reached the surface of the glacier, which appeared at this spot as if covered with fresh snow. Our attention was, however, soon diverted from this magnificent spectacle; for, on turning an angle of the rock, a spontaneous exclamation of delight burst from the lips of the whole party, on suddenly beholding the church and village of Grindelwald. To our eyes no valley had ever before appeared so beautiful; the glare of the ice and snow, which for several hours had dazzled our sight, was now exchanged for the verdure of the pastures, watered by the foaming waves of the Lutschine.

We now at length reached the level of the valley, after descending constantly for five consecutive hours—a fact which the tired condition of our limbs reminded us of. The distance from the glacier to the village inn is but a quarter of an hour's walk; but such was the effect of the warm air of the valley upon us, that this short and trifling ascent fatigued us in a greater degree than the former part of our excursion; or it rather awoke in us the sentiment of fatigue. It was three o'clock P.M. when we entered the Hotel de l'Aigle, and no credit was at first given to our assertion, that we had that morning left the glacier of the Aar: it appeared that the passage of the Strahleck had never before been accomplished in so short a space of time, even by the chamois hunters. The mountaineers of the village, in fact, entertained a most exalted idea of our personal prowess; inasmuch as the rope, which had so materially assisted us, had been previously concealed by our guides, who stoutly maintained that our alpenstocks had been our sole aid during the course of this interesting and hazardous adventure.

FIRESIDE CHIT-CHAT.

NO. V.

They talk of the fine arts—popular amusements and indulgences—pawnbrokers—usury—gambling—and railway directors; on all which subjects Gilaroo announces some very extraordinary doctrines.

Stukely.—What a capital exhibition of pictures there is this season. Are you fond of pictures?

Gilaroo.—Yes; that is to say, I like to look at good ones. I cannot say, however, that I am a buyer. To be so, requires a heavier purse and a more profound credulity than I happen to possess. There is a great deal of trash palmed off on those not initiated in the mysteries of the craft.

Stuke.—What is your opinion as to the humanising influence of pictures—say the fine arts generally?

Gil.—I consider that the contemplation of all objects of refined art tends to elevate the sentiments, provided the mind is, generally speaking, cultivated in other respects. This, you will observe, is making a considerable reservation; yet not greater, I should think, than the subject demands. I will try to explain myself. In Italy, the common people have a greater relish for pictures than many of high rank in other countries. Of this class of productions they see great numbers in the churches; while some of the finest sculptures are equally open to their observation. If the fine arts could humanise anybody, it would be the Italians, particularly the inhabitants of Rome and Naples. Now, with regard to the lower orders in Italy, it does not appear that the frequent contemplation of some of the grandest achievements of the pencil is of the slightest effect in making them honest, industrious, or cleanly in their habits. In one of the towns of Italy, a large collection of pictures, of the best masters, is ranged in the open street on the occasion of a certain annual festival. To this public exhibition flock all the brigands within twenty or thirty miles; and these banditti may be seen pushing about among the crowd, to criticise the works offered so freely for inspection. After the exhibition is over, says the traveller who mentions the circumstance, the brigands return to the highways and mountains, where they recommence their predatory life, robbing and murdering without mercy or remorse. It would appear from this, that the fine arts have no necessary bearing on morality. As to their connexion with mere good taste, in the way we understand it, I am equally at a loss to see any such thing. A friend of mine, who, not long ago, spent a

winter in Rome, had occasion to go one day to the house of one of the principal artists. He found this man and his family living in the midst of all that is slovenly and nasty; his works full of ideal beauty of the highest kind, but his own common life an exemplification of all human beastliness. We often, in England, meet artists of whimsical character, whose habits of life make this description far from incredible.

Stuke.—Then you mean to say that a taste for the fine arts is of no use?

Gil.—Far from it. It seems to me that, by itself, this taste is of little use. Let us begin at the beginning—the schoolmaster first, to open the understanding; literature to cultivate; and the arts to refine. I should have no objection, however, to see pictorial art aiding, as far as it can aid, in the preliminary course of culture. We all know how children may be amused and interested with picture-books; and the increasing desire to visit galleries of paintings may be considered as indicative of a distinct advance made in the popular mind. Gratified with these signs of progress, or influenced by other considerations, some would exalt the fine arts beyond their proper sphere—make them all in all. According to them, the painter transcends the educator, the poet, and the philosopher; they talk of the 'divine Raphael' and the 'immortal Corregio,' as if they were demigods. Let me, however, do justice; it is principally dilettanti who write and chatter in this sort of way about art and artists. I should say that a man of really cultivated mind is above all this nonsense.

Stuke.—Still, you allow that there may be an advantage in improving the popular taste?

Gil.—I repeat that the exhibition of good pictures, or good designs and models in any branch of the fine arts, may be made instrumental to general improvement, more particularly if the people are prepared by education to relish and take an interest in these things. The attracting of multitudes, for a time, from low pursuits, and giving them something harmless to talk about, would alone furnish a reason for encouraging such exhibitions. Better be amused with a walk through a gallery of pictures, than with the spectacle of a horse-race, or a tavern potation.

Stuke.—There are, as you know, parties who consider all sorts of amusement sinful.

Gil.—That, I am sorry to say, is too true. Persons of this way of thinking err from an excess of good intention. They fail in making a just estimate of the wants of human nature. Work, books, study, devotion, out-of-door recreations, in-door amusements—everything in its own time and place. My own conviction is, that amusement, in some form or other, is a necessity of our nature. Those, therefore, who would put it down, must necessarily fail, for they fight against nature. The pent-up feelings only burst out in some unexpected and unpleasant way. All nature is full of rejoicing. Even the lower animals dance, skip, and amuse themselves. Many of them go further—they are fond of decoration. Some clean themselves, in order to be neat and attractive; and certain birds in Australia are observed to construct avenues and bowers of pretty shells and feathers, in which they promenade daily, as if enjoying a conversazione. And are not the flowers of the field clothed in beauty, to gladden the eyes of bees, and birds, and other creatures? Are not fishes covered with glittering and variegated scales? Are not shells, lying in the depths of the ocean, resplendent with hues which mock the painter's palette? Then, what sweet sounds expressed by some of the feathered tribes! Surely all this ought to teach us that amusement, drawn from harmless sports, recreations, a love of the beautiful, a love of melody and harmony, is alike natural and allowable. But it is only the gloomy who cherish contrary views. Throughout Great Britain generally, in some quarters more than in others, there has long been a morbid fear of popular recreations. The consequence has been, that, driven or discouraged from what is ostensible and harmless, the people have sought relief in what is clandestine and vicious. There would be fewer taverns, if there were more places of resort of a purer kind.

Stuke.—Don't you think it would be a good thing to greatly limit the number of public-houses—give a license to comparatively few?

Gil.—Where the number is excessive, it ought certainly to be reduced; and I am inclined to think that on this subject the magistracy are, for the most part, anything but vigilant. Yet the adoption of any severe measure to limit public-houses is attended with serious difficulties, not at first observable. Where a demand exists, there will of course be a supply. The public-houses are a consequence of a demand for those enjoyments, such as they are, which are derived from them. By extinguishing them, the demand may, to a small extent, be limited in operation; but, in the main, it will supply itself somewhere, and somehow. It has been found, for instance, that where licenses were refused, a clandestine trade of dram-selling has sprung up; and to get at the parties who thus infringe the law, is next to impossible. Supposing that all the public-houses were shut up by authority, the selling of liquor would not the less be carried on; the only difference would be, that the trade would be conducted in a private and more objectionable manner. All that I should wish to see done, is to license only parties of respectability, and to a reasonable extent.

Stuke.—That would be making the trade a kind of monopoly.

Gil.—It would in one sense; but of two evils, it is best to choose the least. So long as there is a general demand for spirituous and other liquors, it is surely of importance that the trade should be conducted on a respectable footing. For my part, I by no means agree in abusing and calumniating the men who devote themselves to this profession. It is consistent with neither justice nor expediency to make an outcry against these individuals. Their business is sufficiently unpleasant, without the obloquy which many would thoughtlessly heap upon it; and a very little reflection will show us that such obloquy can only have the effect of driving respectable persons from the trade, and of consigning it to a lower, perhaps a despicable and dangerous class of society. All the declamation in the world against public-houses will never subdue intemperance.

Stuke.—I have always entertained the opinion, that stringent regulations were desirable for public-houses and pawnbroking establishments. Both are the blight of large towns.

Gil.—Let both be placed under strict, though not severe and captious regulations; to that nobody can have any objection. The thing I would deprecate is that kind of sweeping severity which always, in some way or other, defeats itself. Take pawnbroking, to which you have referred. What trade has been exposed to more unjust sarcasm? Every epithet of abuse has been poured on the unhappy pawnbroker, as if he were a vampire preying on the vitals of the community; whereas he is nothing more than a tradesman, who lends money on goods at a certain regulated rate of interest. In this way he relieves the temporary necessities of thousands, who, but for him, would not know which way to turn for assistance. That very foolish and improvident people get into a habit of pawning articles, is nothing to the purpose. The fact is undeniable, that the pawnbroker is a reliever of those in urgent need of a few shillings or pounds; and, as such, why should he be persecuted? It could be shown, from historical evidence, that pawnbroking has contributed to lessen crime. Before it was established, robberies, in order to get hold of petty sums, were common in the neighbourhood of large towns. I believe that London, and many other places, would not now be endurable were this profession extirpated. In short, I consider the pawnbroker as a useful auxiliary in our present state of society.

Stuke.—What do you say to their taking such a usurious rate of interest?

Gil.—I believe, in the first place, the fact is not so; I have seen it shown that the profits of pawnbrokers are not generally higher than those of other tradesmen; in the second place, I do not join in the howl against what is called usury.

Stuke.—Not condemn usury, and you so great a philanthropist?

Gil.—I don't condemn things merely because they have for ages been subject to a vulgar clamour. I must know the why and the wherefore, before pronouncing a judgment. You will perhaps, therefore, inform me why there should be such an outcry against this terrible bugbear?

Stuke.—I!—I cannot say much about it. All I know is, that there is cruelty in taking an excessive interest on money; it looks like crushing the fallen—robbing the poor and unfortunate.

Gil.—This is one of those cases in which, by a well-meaning but short-sighted wish to protect the unfortunate, as you call them, a general injury is apt to be committed. Supposing men to possess common sense, they are unquestionably able to protect themselves against imposition. When a man borrows L.100, I imagine it is not to spend it foolishly, but to lay it out in some advantageous way. He reckons the cost of the loan—that is, the usury or interest to be charged—against the anticipated advantage, and if this advantage be greater, he borrows the sum. Here there is an act of reasoning; and, presuming that every man knows his own business best, it would seem to me to be an impertinence to prevent him making the negotiation. Laws against usury appear to assume that the mass of people are no better than children, and are not fit to manage their own business.

Stuke.—But are there not too many in that condition?

Gil.—There are many persons, doubtless, neither wise nor prudent; but it is poor policy to legislate for exceptions to a rule. Besides, the legislation does no good—fails to benefit the very individuals for whom it exists. It is clear that if a law be made to prevent any one from taking more than, say 5 per cent. per annum for the loan of money, while money is worth 6 per cent., it will, as a matter of course, be evaded. Ostensibly, the money will be lent at 5 per cent., but, by a private agreement, the borrower will be obliged to pay 1 per cent. additional in the name of commission or some other illusion.

Stuke.—Then you consider it impossible to regulate such matters by law?

Gil.—Quite so; not only impossible, but the effort to do so is immoral. Laws which propose to regulate profits of trade, or, in other words, to step in between man and man, can never be anything but fallacious. The better plan is to allow a perfect freedom in business transactions of every sort; and, as I said before, if there be an evil, it will soon correct itself. Nothing like rivalry in trade for keeping down exorbitant profits.

Stuke.—You consider gambling bad—immoral?

Gil.—Certainly.

Stuke.—Then, according to your view of affairs, gambling should be left to cure itself?

Gil.—No such thing. Gambling is not trading. It is a vice, ruinous alike to public and private morals. The result of every industrial pursuit is increase—something gained. All the objects of value which we see, have been produced by the united efforts of industry. But gambling produces nothing. A dozen men might sit round a table gambling for a whole lifetime, and at the day of their death, there would not be a penny more amongst them than at the beginning. Conduct of this sort is not less profitless than mischievous. It distracts the mind from every useful pursuit. In short, if all spent their time in gaming, society would stand still, or rather retrograde. On this account the law, as a matter of police, very properly discountenances public gaming-houses and lotteries.

Stuke.—I am afraid you are knocking yourself down with your own argument. You formerly said that people were generally able to protect themselves against imposition. Why, then, may they not be left to protect themselves against the arts of the avowed gambler?

Gil.—Because gambling addresses itself to human weakness and passion, and is demoralising in its effects. A time is doubtless coming when the common-sense of society will be amply sufficient to put it down; but at present, the ignorant and dissolute are numerous, and they require the law to act parentally towards them. Already, by the advances which have been made, and by the increasing scope for industrial exercise, gambling is greatly on the decline—nothing like what it once was.

Stuke.—And yet what a monstrous deal of gambling there has latterly been in railway undertakings!

Gil.—Much could be said on this subject for and against. Railways are a new thing, and it is certain that some of them have been exceedingly profitable as commercial enterprises. The returns for investments in the better class of lines have been very large indeed. So much for the temptation, in the first instance, to peril money on railway shares. Condemning the late paroxysm of speculation as much as any one, I can see that much of this species of gambling—to call it by that name—arises from the difficulty of getting profitable outlets for capital in the way of trade. Hitherto, from the effects of various laws imposed on commerce, the savings of labour have been pent up in a great measure within the limits of our own country—not allowed to go abroad over the world, seeking for fields of usefulness. Abolish these laws; let people see their way clearly in matters of foreign and colonial enterprise, and we shall soon have a different result. Capital—which is fighting against itself at home, making railways where no railways are wanted, and committing many other absurdities—will in time, I have no doubt, be engaged in reclaiming the fertile lands of Canada, Australia, and New Zealand—vastly to its own benefit. I expect to see some splendid changes of this kind within the next twenty years.

Stuke.—Well, I have done—and yet I would say one word more. Have not railway directors been very much to blame for what you call the paroxysm of speculation?

Gil.—I daresay *some* railway directors have been thus culpable; but because a few knaves have been detected, is it right that a large and most respectable body of men, with the purest motives, and many of whom have given themselves an immense deal of unrequited trouble, should be held up to ridicule and abuse? I greatly deprecate this species of injustice; for, if successful in its aim, it must inevitably have the effect of driving respectable individuals from railway management, and consigning it to parties of inferior standing and reputation.

THE PROFESSOR OF SIGNS.

A SCOTCH LEGEND VERSIFIED.

Now, in these days, when every one is itching
To strike out some new, strange, and wondrous plan,
Though 'twere to make Vesuvius a steam kitchen,
Or turn Mount Ætna to a frying-pan;
Yet I am sure you'd meet with many a man
Ready to listen to such arrant coaxers,
And join the joint-stock company of wholesale hoaxers.

I'm tired of listening to each new invention;
Steam, gas, and railroads, almost make me sick;
They so engross the gentlemen's attention,
They care no more for us than for a stick:
A stick?—not half so much; for if 'tis thick,
And sound, and strong, and long, it is a prize
More valuable by far than woman's eyes.

Alas, poor womankind! if I had leisure,
Your hard, hard lot I'd feelingly bewail;
I'd tell of all the days of bygone pleasure
In the chivalric times, when you'd prevail,
By a few glances, haughty knights to quail;
And cause both kings and kaisars own your power,
And humbly sue around bright beauty's bower.

You're 'fallen on gloomy days;' gone is your glory!
But I can't help it, so I'll say no more,
But hasten onward with my little story,
And hope 'twill please you when you read it o'er.
'Twill show you that strange whims, in days of yore,
Possessed men's brains and fancies; so that we
Must be content with mankind as they BE.

I doubt they'll ne'er be better. But I'm wandering,
Or rather dallying upon my way;
I do not think there's any use in pondering
Upon the imperfections of the day,
Unless we try to mend them: this we may
Find a hard task indeed, but we should try:
A mouse once served a lion—so may you or I.

But to my tale. When James the First was seated
Upon the British throne, from Spain's proud land
Came an ambassador, whose head was sheeted
Inside with learning mystical and grand,
Which few pretended even to understand
But our sage monarch, whose great bosom yearned
To bear the title of King James the Learned.

The Spanish don had taken up the notion,
That signs were far before the use of speech;
That every country should have schools, where motion
Should be the only learning they would teach;
Thus putting it in every person's reach
To be ambassadors to foreign lands,
By learning the diplomacy of hands.

The learned Spaniard one day was bewailing
The darkened state of Europe to the king,
And said that every monarch, without failing,
Should have established such a useful thing
In his dominions. James's pride took wing;
And, soaring above truth, to gratify
His humour and the don's, he told a lie.

'Why, sir, I have in my most northern college
(I'm sorry 'tis six hundred miles away)
A wise and learned professor of the knowledge
Of signs and signals.' 'Oh! what is't you say?'
Exclaimed the don with joy; 'this very day,
If 'twere six hundred leagues, I will set out
And see what your professor is about.'

In vain the king endeavoured to dissuade him
From going forth on such a wild-goose chase;
At last, on finding nothing could persuade him,
He wrote a letter, stating all the case,
And ordering the professors of the place
To do the best they could to entertain
The ambassador extraordinary from Spain.

You may be sure the college was confounded
When reading o'er this letter from the king;
The grave professors were amazed—astounded;
They never heard before so strange a thing;
But the command was urgent—they must fling
Truth in the well; and, when the don should come,
Say that the SIGN Professor had left home.

Meanwhile the college, all were in commotion,
Preparing entertainment for the don:
Coach after coach arrived, till, with emotion,
They saw the illustrious stranger step from one.
'Where is,' he cried, 'the Sign Professor?' 'Gone
Upon a tour unto the Scottish Highlands,
From thence to visit all the western islands.

'Twas most unfortunate that he had left them,
Nor could they guess the time of his return.'
The ambassador's reply almost bereft them
Of all their senses, causing them to mourn.
'To see this wondrous man my soul doth burn!
I'll wait,' so said the don, 'his coming here
Days, weeks, and months—ay, if it were a year!'

Alas! what can they do, he is unshaken?
And certain were they that he would remain;
For, from the journey he had undertaken,
He was a most decided man, 'twas plain:
And oh! what cost 'twould be to entertain
Him and his suit for twelvemonths, and that then
He'd find their king and them but untrue men.

They were indeed in a most strange quandary;
Not knowing what to do, nor what to say.
I will not hint they cursed the king's vagary,
But, I am sure, they wished the don away.
At last they thought upon a man who'd play,
For fun, the great professor of the knowledge
Of signs and signals in the learned college.

This man was butcher to the institution,
And full of drollery and mother wit;
And ever ready for the execution
Of any whim or frolic he thought fit:
And readily he undertook to sit,
In solemn guise, before the Spanish don,
Though he could boast two eyes, while Geordie had but one.

Geordie was not a single word to utter
Whilst in the presence of this lord from Spain;
But, with his hands, he was to sign and sputter,
And do the best he could applause to gain.
This being settled, suddenly they feign
That their professor had returned, and he
Would in the morn receive the illustrious grandee.

The day at length arrived; all were in motion;
Geordie was dressed in flowing wig and gown,
And seated in a chair. Soon, with emotion,
The Spaniard entered, bowing lowly down
Before the venerable man, whose frown
Evinced great condescension and benignity:
So thought at least even haughty Spanish dignity.

The real professors in the next room, trembling,
Sat, waiting the conclusion of this scene;
Fearful that now, at last, all their dissembling
Would by the great ambassador be seen;
And that, henceforth, he'd call them liars mean:
And thus their honour, and the king, and nation,
Would suffer loss by such a degradation.

The learned don began poor Geordie's trial,
By holding up one finger to his view;
And he immediately, as in replial,
Held up before his excellency two!—
Wondering within himself what next he'd do.
Three fingers then his lordship raised on high;
Stern looks and a clenched fist were Geordie's next reply.

Forth from his pocket then an orange taking,
The Spaniard held it up to Geordie's face;
And he returned the compliment by shaking
A piece of barley-bread at his proud grace.
The grave Hidalgo, silent, left the place,
Bowing with reverence to the wondrous man,
Whose practice thus made good his favourite plan.

When he rejoined the masters of the college,
They timidly inquired what he now thought
Of their sage brother? 'Oh,' cried he, 'such knowledge!
He is a prize, whose like could not be bought
By India's wealth! Ah, long, long I have sought
For such a man profound, to understand
Points most abstruse by motions of the hand.'

'May we presume, then, most illustrious stranger,'
Resumed the pleased professors, 'to inquire
(Now that they saw themselves safe from all danger,
Their courage did fine compliments inspire)
How fared your excellency?' 'Your desire,
Oh, gentlemen,' said he, 'I'll satisfy;
And well may what I tell your college gratify.

When first I came before this wondrous creature,
I held one finger up, to signify
There was one God, who made and governs nature.
He held up two, to show me, in reply,
That Son and Father were but one: then I
Held up three fingers, thus to signify
That I believed the Holy Trinity.

He, looking sternly at me, closed his hand,
As if to show me that the three were one—
The wisest surely he in all this land,
And of your college quite the paragon!
I then took out an orange, to make known
The bounteous mercy of the Great and Good,
Who gives us luxuries as well as food.

But judge, oh gentlemen! what was my feeling
When this great man drew forth a bit of bread,
The staff of life! thus to my sense appealing,
That necessaries were profusely spread
In every land, whilst luxuries were shed
But in a few. No more could I presume
To question him: I, silent, left the room.'

When the ambassador had left the college,
The masters hastened to call Geordie in;
And begged he'd tell how he acquired the knowledge
Of signs so well, such great applause to win:
In short, they prayed he would at once begin
To tell them of his curious transformation,
By which he saved their honours and the nation.

The butcher, having thrown off the professor,
Began his story thus:—'When the old don
Entered the room, the rascally aggressor
Held up a finger, as if making fun
Of me and my blind eye. To show my one
Was good as both of his, I held up two;
Then the old scoundrel raised up to my view

Three of his Spanish fingers, as if joking
We only had between us two three eyes.
This was so impudent and so provoking,
It made my passion angrily arise,
To think of such an insult. But surprise
Did not make me forget your honours—I
But gave him a cross look and bent fist in reply.

His impudence did not rest here, however;
But from his pocket he an orange took,
As if to show me that auld Scotland never
Could hope to vie with Spain. My whole frame shook
With rage at this; but, with contemptuous look,
I snatched a barley-scone from out my pocket,
And shook it in his face, to show the blockhead

I did not care for all his trash a bucky!
And neither do I—but I must complain
Of being bound to silence—'twas unlucky;
For I'd have taught the haughty lord of Spain
Not to affront me or our land again!'
Thus saying, Geordie scraped and hastened thence,
Regretting that he had not proved his sense

Upon his excellency's ears, by shaking
And boxing them; that he might understand
The great and powerful progress he was making
In studying the motions of the hand:
That so, when he returned to his own land,
He might, to enforce his plans, tell of the knowledge
Of signs acquired and taught in the Scotch college.

M. A. G.

RISE OF GREAT MEN.

It is beneath the philosophy of history to inculcate that men who rise from comparatively low to the highest stations, do so from any cause besides that of force of character, operated upon by force of circumstances. To suppose that the future dictator, king, emperor, or protector, shapes his conduct with a view to reach the greatness he ultimately arrives at, were absurd in the case, probably, of the most ambitious individual that ever existed. At most, the aspirer sees a few of the successive points of elevation that mark the height before him; and he is impelled upwards as much by the pressure of his fellows as by his own talents and desires. As 'hero-worship' goes far to make the hero, and as, where sacerdotal power predominates, the people are always as ready to constitute the priest their master as the priest is wistful to see the people obedient, so political power is thrust upon a man of commanding ability by a sort of instinct in the thrusters, especially in troubled or unsettled times. Such times are essential to the attainment of the *most* exalted posts by those who originally occupied much lower ones, be their ability ever so commanding: to this rule history will hardly present an exception. And so Cromwell would have been an eminent brewer, country-gentleman, or parliament-man under the reign of Elizabeth; Napoleon only the first general of his age, had he led the armies of Louis Quatorze—the demigod of the French nation; and Cæsar, living in our own days, would have conquered and written as has done the Wellington of these times, adding to the splendours of the sway of George IV., and reposing on his laurels at the courts of King William and Queen Victoria.—*Literary Florets*, 1846.

THE PHILOSOPHER'S REWARD.

Whatever may be the difficulties of the task before us—and difficulties great and many there are—we may rest assured in the reflection that our reward is certain. No man ever followed the study of nature with honesty and diligence, without an ample repayment of discovery. The particular object sought may not at that moment be attained; none can tell at the outset of an investigation where it may lead, or in what way it may terminate; but this is certain, that lead where it may, and terminate where it may, new, important, and interesting truths will have been met with, and the boundaries of human knowledge permanently enlarged. Disappointment in the study of nature is impossible, provided legitimate objects be alone pursued, and by the appointed means. When physical truth ceases to be admired and loved for its own beauty and excellence, and scientific discovery becomes merely valued as a source of personal reputation, as the road to wealth and power and earthly dignity, then indeed may the bitterness of disappointment be often felt, and jealousy and bickerings divide those who, beyond all men living, should be the first to set an example of unity and brotherhood, whose lives are habitually passed in the contemplation of the handwriting of God.—*Professor Fownes.*

SCIENCE AND RELIGION.

We are far indeed from delighting in the tendency of some authors on natural sciences to drag in religious views at every turn, thus secularising things sacred in the attempt to sanctify things profane. We avow our belief that the province of natural theology is confined within narrow and very definite limits, although within these limits it exercises a just and incontestable jurisdiction; but we delight not in the pedantry of converting treatises of science into doctrinal compilations. There is, however, an opposite pedantry as worthy of condemnation. We conceive it to be impossible for any well-constituted mind to contemplate the sum and totality of creation, to generalise its principles, to mark the curious relations of its parts, and especially the subtle chain of connexion and unity between beings and events apparently the most remote in space, time, and constitution, without referring more or less to the doctrine of final causes, and to the *design* of a superintending Providence. We call it the highest pedantry of intellect to put to silence suggestions which arise spontaneously in every mind, whether cultivated or not, when engaged in such contemplations.—*Quarterly Review for December.*

M. D'AUBIGNE.

The manners of D'Aubigné are marked by a plain, manly, unassuming simplicity; no shade of ostentation, no mark of the world's applause, upon him—a thing which often leaves a cloud of vain self-consciousness over the character of a great man, worse by far than any shade produced by the world's frowns. His conversation is full of good sense, just thought, and pious feeling, disclosing a ripe judgment, and a quiet, well-balanced mind. You would not perhaps suspect him of a vivid imagination, and yet his writings do often show a high degree of that quality. A child-like simplicity is the most marked characteristic to a stranger, who is often surprised to see so illustrious a man so plain and affable. He is about fifty years of age. You would see in him a tall, commanding form, much above the stature of his countrymen; a broad, intelligent forehead; a thoughtful, unsuspicious countenance; a cheerful, pleasant eye, over which are set a pair of dark shaggy eyebrows, like those of Webster. His person is robust, his frame large and powerful, and apparently capable of great endurance; yet his health is infirm. Altogether, in face and form, his appearance might be described in three words—noble, grave, and simple. The habit of wearing spectacles has given him an upward look, in order to command the centre of the glass, which adds to the peculiar openness and manliness of his mien.—*Wanderings in the Shadow of Mont Blanc.*

INGENIOUS MODE OF DEMONSTRATION.

In the collection of natural history at Cassel, in Northern Germany, is a very interesting set of volumes, as they appear to be; though, when examined, they prove to be no real library, but specimens of the woods of five hundred different European trees, made up in the form of books. The back is formed of the bark; the sides of the perfect wood; the top of the young wood, with narrow rings; the bottom of the old wood, where the rings are wider apart. When one of the volumes is opened, it proves to be a little box, containing the flower, seed, fruit, and leaves of the tree of which it is a specimen, either dried or imitated in wax. Something of this kind, though with a more especial reference to the age of trees, might be made an interesting portion of our own collections in natural history, both public and private.—*Chronicles of the Seasons.*

CONSEQUENCES OF INDULGENCE.

I have heard of a mother who humoured her son to that pitch of folly, that, upon his taking it into his head that it would be pretty to ride upon a cold sirloin of beef which was brought to table, she gravely ordered the servant to put a napkin upon it, and set him astride in the dish, that he might have his fancy; and of another, who begged her little daughter's nurse to take care of all things that the child should not see the moon, lest she should cry for it. If parents will in this manner make it a point never, even in the most necessary cases, to oppose the wayward wills of infants, what can they expect but that peevishness and perverseness should grow upon them to a degree that must make them unhappy on every occasion, when they meet with proper treatment from more reasonable people?—*Burgh.*

No. 117. New Series. SATURDAY, MARCH 28, 1846. Price 1½d.

THE LADIES' INITIATIVE.

'Well, Mr Balderstone, you are the most provoking person in the world—always bringing up that absurd idea of yours about our marriage. I should have expected you, at the end of twenty years, to have got tired of it, as I'm sure I have been for many a day. And to speak of it before people too! It is positively shameful.'

'Quite a true idea, however—I will go to death upon it. I was a young man taken in and done for. Perhaps well for me I was; but however that may be, so was the fact. I advert to the circumstance as a curious point in human nature, not as opprobrious to you, my dear Mrs B. Content yourself on that score.'

'Point in human nature! And so, to illustrate human nature, you are to represent me as having degraded myself by drawing you into matrimony! Oh, Mr B., Mr B.!'

Here all the gentlemen at table set up their ears, as for a coming joke, while the ladies affected to look excessively indignant. Mrs Balderstone was all injured innocence.

'What, in brief, is your idea, Balderstone?' inquired my friend Sleeman.

'Why, it is just this—that, in our courtship, I believe it was only in appearance that I represented the active voice, and she the passive; for, in reality, intending it or not, she was the means of bringing our acquaintance up to marrying point.'

'I entirely deny the allegation,' said Mrs Balderstone; 'but let him go on.'

'Well, how was it?' said Sleeman.

'Why, if you would believe her, I performed courtship in the customary manner recognised among civilised nations; that is, showed an interest, paid attentions, took charge of an album, and allowed myself always to happen to take the next seat to hers at table, till at length it seemed meet to me to propose for her hand, which she, with a great deal of coyness, accepted.'

'Yes,' interposed Mrs B., 'that is the true account.'

'That I deny. The true account is this: at our first interview she proved extremely agreeable, and passed a very pretty compliment upon my violin-playing. Seeing her then to be an unusually attractive person, I asked leave to conduct her home, and found a gracious acceptance. We met again soon after, and she gave me such a decided preference as a partner in the quadrilles, that I became partial. She expressed a hope that I had brought my violin. I had done so, and in the course of the evening played a few solos. Not only did she listen attentively, but when an impertinent young beau addressed her in the middle of my playing, I observed her frown him into silence. There was so much good sense there! We had a chat afterwards about Wordsworth, when I found her so completely of my own opinion as to the wonderful powers of the then neglected Lake poet, that I became convinced she was an extraordinary young lady. We so coincided, too, in our taste for the country. The town was horrible—only to be dwelt in from necessity. How delightful to consort with nature in her own domain—to watch the changes of the seasons, to roam the flower-gemmed fields or the shady forests, to see the sun rise, to hear the lark sing, to mingle with the simple-hearted rustics, and join in their glee. Oh there was nothing like the country!'

'Well, I think so still.'

'Yes, but that is not the point. The affair now went on rapidly. We agreed to consider ourselves as friends, and, in that character, to discuss a vast number of matters in conversation and by letter. We were to be quite abstract: it was understood, if not expressed, that it was no love matter, but only a communing between two uncommonly harmonious spirits, whose being of opposite sexes was only as it happened. I inserted at the same time in her album all the sentimental verses I had ever written, from school-days downwards. She liked the general style of them amazingly, though there were two lines which she thought might be improved, if I would give them my attention. About that time, spending the evening at her mother's house, I found a young officer present, whom they represented as an old friend. Very well, he was an old friend, and therefore entitled to be treated on comparatively familiar terms. What was this to me? Strange to say, it made me uneasy. I could not bear to hear Georgina abandoning her fine mind to the frivolous commonplaces which suit a military understanding, and I came away disconcerted.'

'He did not enter into your views about Wordsworth?' said Sleeman.

'Not at all—nor she neither for the time. It happened that just that night I had brought in my pocket—designing to read it to her—a critical analysis of the Excursion, which I had written for a west of England magazine. It had to lie *perdu* where it was, as Georgina was too much engrossed with the lieutenant's account of a recent ball, given by his regiment at their last quarters, to have any ear for either poetry or criticism.'

'Well, your friendly correspondence would be perilled?'

'Yes, and what was the provoking thing, my standing on the footing only of a friend gave me no title to complain. I was wounded, but had to conceal my hurt.'

'You have no idea how sulky he *looked* with it, though,' interposed the lady.

'Perhaps so. I daresay it was capital fun for you.

I went one morning, designing, if possible, to express my opinion of friendships with unidead officers, when, behold the object of my antipathy on the ground before me! They were just going out to visit a picture exhibition. I retreated in great vexation of spirit, and that night wrote to Georgina, telling her that friendship was all very well, but nothing to love——'

'Which I thought the oddest procedure in the world. What had my going to an exhibition with Lieutenant Littlepate to do with the transformation of friendship into love?'

'Nothing in theory, but a great deal in practice, as I found to my cost. Three days after, I was Georgina's accepted lover. Three months after, we were married! You see, Sleeman, how it was?'

'Oh, perfectly; but by all means give us your own ideas about it.'

'Well, I was quite blind at the time, and for about a year after our marriage. But I then began gradually to see the real nature of the case. The feeling of preference had first arisen with her. She had gone ahead in attachment all the way along, though never betraying it.'

'Come, come, Mr Balderstone,' exclaimed two ladies at once. 'This is too bad,' pursued one of them, 'to make out your wife to have acted in such a manner. I stand up for her, and for my sex in general. It is a scandal to us all.'

'Listen, my dear Mrs Asperall,' said I, 'and you will find I design no scandal. I acquit the lady of the slightest approach to impropriety. I do not think there was any harm in what she did. It was all very innocent and natural in my opinion. What I wish to establish is merely the fact, that I was a person acted on in the case, and not the prime agent. On investigating, in recollection, the origin of our attachment, I find that what first drew my attention at all, was a certain graciousness of manner towards me. She dropped, perhaps by mere chance, a word in praise of my violin-playing. My love of approbation was excited, and I became disposed to think favourably of her understanding. When she bade me adieu that evening at her own door, there was an indefinable something in the words, that remained with a pleasing effect in the memory. Strange that the shadow of a tone will rest on the heart, and be fostered there! At our next meeting I began with some *empressement*. It might have appeared as something spontaneous on my part; but, in reality, it was the effect of these same impalpable demonstrations of hers on the previous occasion. Then our harmony of opinion on literary and other subjects arose simply from this—that I spoke my own feelings, and she assented to and approved of them. She did so, because, in all sincerity, I believe she felt that they were, in the main, just, or was too partial to criticise them rigidly; but the effect was to increase my respect for her mental character, and to add to the interest already excited. Afterwards there was plenty of ardour and extravagance on my part, and no want of delicacy and shyness on hers——'

Mrs B.—'Well, I am glad he acknowledges that at least.'

'And yet each one of my words and acts was the result of something foregone on her part—something that, with a look of water, always somehow proved to be oil: mean it or not, such was the effect of her conduct. And thus, throughout the whole affair, seeming and reality were in constant contradiction. She was virtually the courting party, I the courted. And I have no doubt that, when I at last made my proposals, she was at once surprised by them, as she professed to be, and yet had been, in some recess of her mind, wondering at their not being made three weeks before. Verily, wonderful are the mysteries of the female character! And so ends my dittay.'

'Well,' said Mrs Asperall, 'if my man were to make any such charge against me, I know what I should do!' Asperall, who was sitting at the other end of the table, observably shrunk up into a smaller space. 'What do you say to it all, Mrs Balderstone?'

'Oh, I deny everything. It is all an innocent dream of my worthy spouse. But I don't suffer alone. Thinking he had made a great discovery in our case, he has set his brain a-fermenting about it, and now he believes that, in a full moiety of instances, the women take, as he calls it, the initiative.'

'Oh monstrous, Mr Balderstone! So you traduce our whole sex! Oh—oh!' and all the ladies, with uplifted hands and averted eyes, murmured, 'Oh—oh!' As for the gentlemen, they were evidently under the influence of those feelings which, in favourable circumstances, develop themselves in mirth.

'You may martyr me with your fans, ladies, if you please. I would die rather than bate one ace of my opinion. But don't suppose I bring it forward as an accusation against you. I rather think you quite justifiable in dividing with us the privilege, as it has been thought, of commencing *les affaires du cœur*. What imaginable right have we to be exclusive in this respect?'

'Ah, that is a very clever way of softening the matter,' said Mrs Asperall; 'but we disclaim all pretension to such a privilege. No, no; the woman is to be wooed, and the man is to be thankful if he can induce her to accept him. Our sense of feminine delicacy is shocked at the very idea of a lady doing anything which is to have the effect of bringing a man to her feet.'

'That may be a prejudice,' said I. 'But, anyhow, what we are first concerned about is the fact. Let philosophising come in its proper place afterwards. Now I say fearlessly—nay, strike me, but hear!—that, in a very large proportion of instances, probably amounting to a full half, the man is first moved by some hardly definable, yet true and real, symptoms of a partiality on the lady's part towards him. A word, a look of kindly grace, often suffices. And even the more obdurate men, who have passed scatheless through hosts of blandishments, are apt to be caught at last by some casual revelation of feeling on the part of one from whom no one would have previously thought that any such danger could come. Mind, to be successful, it must be *natural and unpremeditated*. No putting on of an air of preference will serve. No trick of any kind can be of avail, except with mere ninnies. But an honourable and sensible man is always liable to be affected when he thinks he can read in a woman's bosom, *before she can read it herself*, the trace of that magic element of life—LOVE!'

'Come, Mrs Asperall, this does not look so bad for us after all,' said a lady at her side.

'There is nothing bad about it, let me once more tell you. It is as natural for a woman to become inspired with a feeling of attachment, as for a man. The only difference is, that her delicacy—a property which I believe to be natural to her, not a mere result of education—shrinks from a broad, deliberate avowal of the sentiment. But she cannot wholly disguise or conceal it. It will then depend entirely on the man's penetration, and his seeing only a natural betrayal of her preference,

whether he is to be affected by it, and moved to love in return. We have all read in the divine Mantuan's eclogue—"I love Phyllis before all, for she wept when I departed." Now, how eternal and invariable is human nature!—one of the men of highest rank and fortune in this country, was first inspired with a regard for his amiable consort by a tear which came into her eye on his departure from her father's mansion. During his whole residence, and to the moment of his leaving, there was no symptom of preference: any such demonstration towards a man so obviously an object for matrimonial speculations, would have only been disgusting. But the departed returned for something he had forgot—the tear, a natural tear, was there; and it had the effect of inspiring an affection which might otherwise have never existed.'

'There is one other instance, *in a very high rank*, of the affair having taken its rise with the lady,' said Sleeman significantly.

'Yes, and good right the lady had in that instance,' quoth Mrs Balderstone; 'why, how was she ever to get a husband otherwise?'

'Right,' said Sleeman; 'and you might say the same thing in a vast number of other cases.'

'Oh, Sleeman, you're a horrid creature.'

'Well, but,' resumed I, 'set all jesting aside. It is only facts, and just inferences from them, which can settle such a question. The plan I took was to make up a list of married pairs whom I know, or have known, intimately, and to set down against each what I have been able to ascertain regarding their courtship. Here it is. [*Intense sensation all round the table—fright visibly depicted on the face of Asperall.*] Of course, what is true in one man's circle of friends will be true in another's, and in the community at large. There are Mr and Mrs D'Oyley; the lady known to have gained him by praising a paper, which turned out to be his, in a review—doubts entertained whether she had not at least a suspicion of the authorship. And there are Mr and Mrs Fender; the gentleman known to have had no idea of marrying till Miss Wood's regard for him was betrayed by a lady cousin of his, to whom she had confided her secret. Mr and Mrs Jones—the lady had a fortune—saw one evening a handsome young fellow who, not having a penny, was about to go to India: they danced in two quadrilles, and met again once or twice: she *asked* him, and they were immediately married. Our friend Wakley—all the world knows his sisters courted him into marrying their friend Susan Hewit, who had taken a fancy to him. And so forth. What need of enumerating cases? [*Face of Asperall brightened considerably.*] Let summation decide the matter. Now, I find there are nineteen cases in which the gentleman fell in love with the lady, and took unequivocal first steps; and eighteen in which the lady had the priority, being, as near as possible, a half. I have not only, then, shown you the grounds for my opinion in human nature—made out, I may say, an *à priori* case—but proved from facts that it is really as I say; that is, the ladies take the initiative just about as often as the gentlemen—though, dear innocent creatures, they are, for the most part, quite unaware of it. I could even go further with the argument, and show the *final cause* of lady courtships in the sad torpidity which characterises some men, the modesty of others [*Cries of oh! oh! from the ladies in all parts of the house*], the fears of many as to family responsibilities [*Cheers and counter cheers*], and various other considerations tending to innuptiativeness amongst our sex. But it is quite unnecessary. Enough has been done to carry the question hollow, if it is to be decided by reason, and not by prejudice.'

'Well, my dear,' said Mrs Balderstone amiably, 'as you are never wrong, we'll hold that you are right in this case. Only don't be too long in following us up stairs.'

'Ah, Mr Balderstone, you're a sad man—I did not expect it of you,' quoth Mrs Asperall, sailing off to the drawing-room.

'Bravo, Balderstone!' cried all my gentlemen friends at once. 'We'll drink your health, my boy, in a fresh bottle of claret, if you will give it us. You have caused our sex to have the best of the plea for once.' [*My health drunk with uproarious cheers, concluding with 'one cheer more,' demanded by Asperall.*]

THE BATHS OF ANCIENT TIMES.

The baths of the Romans have been frequently and elaborately described, but we think the following historical sketch, extracted from M. Corbel Lagneau's recently-published *Traité Complet des Bains*, contains many points of interest, some of which are not familiarly known.

The use of the bath has existed, in all probability, from the beginning of the world, since it is founded in the most natural wants of man. The necessity of maintaining the cleanliness of his person, of defending himself from the heat of a burning sun, and of seeking refreshment after the fatigues of the chase, war, or labour, must have taught him, from an early period, the advantages derivable from bathing. But in barbarous ages, in which art had as yet accomplished nothing for the conveniences of life, men merely plunged into rivers, streams, fountains, and other natural reservoirs of water. They were far from dreaming of the erection of apparatus by means of which they might be enabled, as at a later period, to take their baths at any time, season, or place, and of an agreeable and salutary temperature. Doubtless the discovery of hot springs, which must have existed then, as in our own times, at various parts of the earth's surface, suggested to them the happy idea of communicating different degrees of heat to the water they employed, and of erecting more commodious and less dangerous receptacles. It was amongst the nations of the East, the earliest reapers of the benefits of civilisation, that industry and the arts made the first efforts to satisfy the wants of men, and perpetuate the taste for, and employment of, warm baths. The custom was carried from Asia to Europe by the colonists, who successively established themselves in Greece, Italy, Iberia, and Gaul.

Greece knew the use of warm baths in the time of Homer, for mention is made of them in several passages of the writings of that poet; and among others, where he depicts the delicious life led in the palace of Alcinous, and when he relates the reception given to Ulysses by Circe. Among the Greeks, the Lacedæmonians were the first, according to Thucydides, who adopted the custom, borrowed from Asiatic nations, of appearing naked at the public games; anointing themselves with oil, and covering themselves with sand, prior to the contest, and then plunging into hot baths. But the employment of baths in private families was not even yet very general in the time of Hippocrates. This prevented his recommending the bath in many diseases which called for its adoption. As to the public baths, they formed part of the *gymnasia* to which they were attached.

The Romans were accustomed, in the early period of the republic, after a day employed in labour in the fields, to wash only the arms and legs; and every ninth day, when they came to the city, to be present in the assemblies for state business, they bathed the entire body. At that period the Tiber or neighbouring streams formed their bathing resorts, vapour and hot-water baths being scarcely known to them. It was only at a late period they thought of establishing public or private baths. The city, by reason of its situation on hills, presented great difficulties for the conveyance of water. It was not until about four hundred and forty-one years after the foundation of Rome that water was brought, for the first time, from Tusculum, by means of an aqueduct constructed by the censor Appius Claudius. Aqueducts were multiplied afterwards; and baths, or *thermæ*, were constructed in various parts of the city, characterised as yet by the ancient Roman

simplicity, as may be seen from the description of that of Scipio Africanus, left us by Seneca.

The new custom which the Romans adopted towards the last years of the republic, of attaching baths to the gymnasia, rendered them indispensably necessary; and the frequent application which physicians, from this period, made of them in the treatment of disease, powerfully contributed to the increase and embellishment of these salutary and useful structures. But it was not until the reign of Augustus that they began to give to their warm baths that air of grandeur and magnificence which is yet to be observed in the ruins which remain. The public baths should, in fact, be justly considered as the most remarkable structures of the Romans. Their founders were princes, who, in their anxiety to conciliate the good-will of the people, endeavoured to surpass all that had been executed before their time. To conceive a just idea of them, we should examine the plans of the principal edifices, as traced by Palladio. In beholding his designs of the bas-reliefs and pictures which adorned the walls and ceilings, we are at once astonished at the perfection of the objects they represent, and at the exquisite purity of taste which then prevailed in the arts. Much more than this; we find ourselves forced to acknowledge that all the efforts of modern art, in the decoration of our palaces, museums, and churches, are in general but servile imitations of the wonders which the baths of Agrippa, Nero, Titus, &c. offered, near two thousand years ago, to the admiration of the Roman people. The rarest marbles, precious vases, bronzes, columns, statues from the chisel of the greatest masters, and gildings skilfully applied, contributed to the brilliancy of the interior of these gigantic monuments.

It is difficult to enumerate the immense number of uses they were devoted to. Besides the vast basins, and the thousands of recesses (the thermæ of Dioclesian contained three thousand) appropriated to the different baths, there were found there theatres, temples, amphitheatres, palaces, festive halls, vast open promenades planted with trees, schools frequented by youth, academies where learned persons assembled for discussion, and libraries to which every one might freely resort.

The most complete establishments contained numerous apartments devoted to the various processes connected with an elaborate system of bathing. The bather, after having undressed, was conducted into the *unctuarium*, where his body was freely anointed with strong oils; afterwards, in an adjoining apartment, it was covered with fine sand or powder. He now repaired to the *sphæristerium*, an immense hall or rotunda, in which he engaged in wrestling, or other gymnastic exercises calculated to develop physical power. When the locality admitted of it, the sphæristerium was uncovered, and exposed to the sun; or rather, in the best-appointed baths, there were two sphæristeria. The various games were continued until the sound of a bell announced that the vapour and hot-water baths were ready. To these the crowd of bathers now proceeded, each person taking his seat on a marble bench, placed below the surface of the water, around immense basins, wherein swimming might be executed when agreeable. While here, they diligently scraped the skin with a species of ivory or metal knife, termed a *strigilis*, by which they detached all impurities from the surface. The *tepidarium*, or tepid bath, and *frigidarium*, or cold bath, were finally employed for a short time, for the purpose of bracing the pores of the skin, relaxed by so long a proximity of moist heat. Before dressing, those who desired to employ perfumes again repaired to the unctuarium.

The baths belonging to private persons differed, of course, from those devoted to the service of the public, as each person followed his own taste in their construction. The same apartment sometimes served for various purposes; and the modifications of form, &c. were as numerous as those of the fortune and the luxurious taste of their proprietors. It was, indeed, the fashion to exhibit an almost insane luxury; and thus we find Pliny addressing severe reproaches to the ladies of his time, who covered the floor of their baths with silver.

The baths of the ancients, although usually built after a similar plan, yet offered a notable difference. At Rome, even in the most splendid establishments, the greater portion of the extent of the edifice was appropriated to baths, properly so called, which obtained for them the name of thermæ, from the Greek word *thermos*—heat. But with the Greeks the gymnasium occupied almost the entire structure, the bath itself being but of very limited dimensions. This difference exhibits the passion for bathing which seized the Romans towards the end of the republic, and continued to possess them until the fall of the empire.

At first, the public baths were only opened at two o'clock in the afternoon, and closed at five: the sick alone having a right to enter them at any time. Latterly, the emperors, wishing to conciliate the people by their favourite amusement, ordered the doors to be opened sooner, and closed later. Nero had them opened at twelve; Alexander Severus allowed the baths to be entered from the break of day, and even furnished, at his own expense, lamps and oil for lighting them. From that time the Romans may be said to have passed their lives at the baths. They frequently bathed twice a-day; and hot water constituted one of the indispensable elements of their existence. We must not, however, attribute this singular passion exclusively to fondness of bathing. The desire and hope of meeting with friends, of discussing the topics of the day, and passing the time agreeably, were no less powerful motives.

Pliny relates a fact which proves the singular jealousy with which the Romans regarded all relating to their baths. A statue of a bather, scraping himself with the strigilis, was placed in front of the thermæ of Agrippa. It was executed by Dysippus, and of such marvellous beauty, that Tiberius, who admired it more than any other statue in Rome, had it removed to his own bedchamber. The populace, unable to bear the deprivation, covered him with insults until he had restored it.

One of the greatest largesses an emperor could confer on the people, on an occasion of public rejoicing, was to decree gratuitous admission to the baths. So great was the passion prevailing for this pastime, that when Rome was labouring under fear, and mourning on account of frightful calamities which had afflicted her, Titus, in order to dissipate these, ordered the rapid construction of the thermæ and amphitheatre which bear his name.

Of all the Grecian people, the Lacedæmonians were the only ones in whom the gymnasia and baths were common to both sexes. The ancient Romans were far from following such an example, and carried modesty so far, as to consider it improper that a father should appear at the same bath with his son, or even son-in-law. Later, however, the corruption of manners made such progress, that in the reign of Domitian, women and men bathed pell-mell together. This custom, then generally adopted, was afterwards prohibited by Hadrian and Marcus Aurelius; again tolerated by Heliogabalus; and finally abolished by Alexander Severus.

The baths were frequented indiscriminately by persons of all ranks. The noblest and richest persons there found themselves mingled with the poorest plebeians. The following anecdote, related by Spartian, leaves no doubt upon this point. The Emperor Hadrian, he says, frequently bathed with a crowd of the people. One day he perceived an old soldier, who, having no person to cleanse his skin for him, contrived a substitute by rubbing his back against a wall. Hadrian, who had known him in the field, inquired why he did this. He replied, because he had no servant. The emperor immediately ordered him some slaves and a pension. The news of so benevolent an action, performed before so many witnesses, quickly spread into every part of Rome; and the next time Hadrian came to the public baths, several old men did not fail to be there

also, and endeavour, by the same means, to attract the notice and generosity of the prince. But the emperor, who had remarked the contrivance, far from treating them as he had done his old companion in arms, caused strigiles to be distributed to them, and ordered them to employ them by assisting each other.

It was not only the city upon the seven hills which contained public and private baths. They existed in all the towns of Italy, and in the palaces of nobles and freedmen. They were found also in all the Roman provinces. In our time even, it is easy to perceive the vestiges of the Roman thermæ in every country which formed a portion of the empire.

The greater number of these magnificent edifices, which, during the most illustrious period of the empire, had constituted the pride and delight of Rome, were destroyed by the Vandalism of the barbarian hordes. Those which were not pulled down were otherwise employed, or, being no longer repaired, gradually fell into ruin. Baths, which formed one of the requisites for the effeminate and luxurious life of the Romans, were, for the warrior and invading nations, mere means for the preservation of cleanliness. Thus the new conquerors were satisfied with taking a bath, as in the time of Scipio; and their slight taste for luxury never inspired them with the idea of erecting monuments resembling those which decorated the ancient city of the masters of the world. Utility and cleanliness were the only objects held in view in the construction of the thermæ, which were henceforth erected in Italy or the other countries of Europe. We find, by the 'Ephemerides Troyennes,' that baths were much frequented during the whole of the middle ages, until the sixteenth century—the epoch at which the use of linen became general. After giving a description of the ruins of the thermæ which remained at Troyes, Grosley adds, 'The barbarism of the middle ages not being able to attain magnificence, confined itself to the convenience of the public baths, and other establishments, which were erected in Europe. The idea was due to the Arabs, among whom the arts and sciences had found an asylum. The crusades and commerce had opened up to Europeans the countries which flourished under the rule of this people, and the natural taste for imitation did the rest. The vapour and public baths were, for a long period, as much frequented in Europe as they are at the present day in the Levant. People were attracted to them for the sake of health and cleanliness; but, above all, from the want of society felt by persons who saw little of each other except in these places. Some took water baths, others vapour baths; while several came only to gossip, comfortably protected from the cold. For these last, the baths were what the stoves of Germany, the *restaminets* of Holland, and the cafés of Paris, are to this day.' M. Marchangy, in his 'France in the Sixteenth Century,' says, 'It was only at the baths, at church, or in sickness, that women ever saw each other. The men also assembled at the baths, the barber's, the wine-shops, and the market-places. There were private baths in the hotels; and persons asked to dinner were at the same time invited to bathe.'

By St Foix's 'Historical Essays on Paris,' we find that the seigneurs and great ladies took a bath daily prior to dining, and that the citizens took several a-week. 'The use of vapour baths,' he says, 'was formerly as common in France, even among the common people, as it is, and has always been, in Greece and Asia. They went to them almost daily. St Rigobert caused baths to be built for the canons of his church, and supplied wood for heating them. Pope Adrian recommends the clergy of each parish to go to bathe, in procession, every Thursday, singing psalms the while.'

As in the times of the Roman emperors, the promiscuous assemblages of the two sexes leading to immoral conduct, gave rise to ordinances and statutes, which were not always strictly obeyed.

Although the increasing use of linen has much diminished the hygienic necessity of the bath, and has occasioned the ruin and neglect of the establishments of the middle ages, yet public establishments have not ceased in our times to become multiplied on every side—thanks to the salutary counsels of medicine, the progress of civilisation, and the amelioration of the material comforts of the masses. Thus there is not a street in Paris, of any importance, which does not contain several baths; and although we find new establishments springing up every day, all, in spite of the number and proximity of rivals, seem to increase and prosper, giving, as it were, the measure of the necessities of an intelligent and enlightened population. It is thus, by spreading through all ranks of society, that this usage has already produced the most satisfactory results as regards the public health; and, by its happy influence, has diminished, among others, the number and severity of the affections of the skin, which no longer, as heretofore, exhibit at every corner of the streets this disgusting aspect of human infirmities.

TO SLAY OR TO SAVE?

BY CAMILLA TOULMIN.

'Well, I must say I was never more surprised than I have been to-day,' exclaimed Colonel Simmonds to his wife and daughter; 'and I am annoyed too; it is so disagreeable to lose a servant that knows what one likes.'

'You mean Pierce, I suppose?' said the lady.

'You have heard about it, have you?' replied the colonel, who had just come home from parade. 'I am sure I wish the old major had been alive again to plague me, rather than have left fifty pounds to be used for such a purpose. It would have taken a good many years, and no common luck, for Pierce to have *saved* enough to purchase his discharge.' And as he spoke, he dashed down his hat with a very undignified demonstration of ill temper.

'What, I wonder, could have induced him,' rejoined the lady, 'to leave such a legacy to a common soldier! If he had remembered one of the children, now, I could have understood it.'

'Oh, there is some story of Pierce having caught his horse almost at the moment it had thrown the major, and when he would inevitably have been dragged by the stirrup, and killed perhaps. It was a year or two ago, and I forget the particulars; but the major always took notice of him afterwards.'

'Then, I suppose, he is not a coward, as one would think he must be from his wishing to leave the army,' exclaimed Laura Simmonds, a young lady who had received only a superficial and class education—a misfortune not uncommon to the children of officers, who are constantly moving their families about with their regiments. In truth, her nature was as largely compounded of silliness and pertness as seemed compatible with the position of a gentlewoman. Hers, too, was that excessive pride of station which attaches itself, in a remarkable degree, to the families of military men, and shows how corroding to the best impulses of the heart, and to the dictates of common sense, must be those strong prejudices which, early implanted, petrify themselves into the character with the encouragement of years. She thought the greatest person in the world was a soldier, and the next degree of rank was to be the daughter of one.

Walter Pierce was one of those handsome, athletic, noble-looking men, of whose imposing appearance as a 'bold dragoon' the recruiting-sergeant is well aware. As a mere youth—which he was when he enlisted—he promised to be such. I do not know precisely under what circumstances the 'persuasive' sergeant succeeded in his endeavour. I never heard that at that early age Pierce had been driven to desperation by a disappointment in love; and as he has always been of temperate habits, it is not likely he enlisted in a fit of intoxication. Thus two of the story-tellers' favourite excuses are at once rejected. Probably he embraced a profession which, to his cost, he found bitterly unsuitable and uncongenial to his tastes and inclinations, from feelings and circumstances common enough. A fine character is seldom that which

is early developed; and, moreover, in youth it is often fatally ignorant of its own nature. At eighteen he might have been dazzled by the vain word 'glory,' and not have known how to distinguish between the false and the real; and he might not have surmised that he possessed energies and aspirations which could by no means be satisfied in the life he was adopting. Walter Pierce had been seven or eight years in the army at the time he is introduced to the reader; but though he bore the highest character, and had always been remarkably attentive to his duties, it is certain that, for a long time, he had cherished beyond every other earthly hope that of one day obtaining his discharge. Fortunately for his own peace, he had had the discretion to keep his wishes to himself, or he would soon have become equally unpopular both with his officers and comrades. Perhaps the 'old major' might have guessed something of the kind, for sympathy gives us great powers of discernment. At any rate, Pierce had agreed with avidity to the proposal his colonel had made some time back, that he should undertake certain duties of a servant—an arrangement common enough—for the sake of the additional money he should be able to save.

In more respects than one, this partial domestication of Pierce in the colonel's family had not been without its results. There was a certain waiting-maid, Fanny Brownlow by name, whose arch beauty and lively manners had made no slight impression on the heart of the soldier. Now Fanny was as useful to the ladies as Pierce had been to the colonel; and the silliest people, when urged by selfishness, become cunning. Accordingly, Miss Simmonds, entertaining a wholesome terror that the most tasteful dresser of hair, and skilful fashioner of dresses, might be lured from her to share the fortunes of Walter Pierce, seized with avidity the opportunity for ridiculing him, which his withdrawal from the army afforded; divining, perhaps by instinct, that even serious accusations, made in a straightforward manner, are generally less injurious to the party attacked than the shafts of ridicule, if ably directed. Events must show the result.

Although Walter Pierce had procured his discharge, and gone through all the formalities attending it, he lingered for several days in the neighbourhood of S——, where his regiment was quartered — and this notwithstanding his express determination of going to London without delay, that he might push his fortune in the metropolis. For three consecutive evenings he might have been seen sauntering up and down a certain shady lane, and pausing occasionally at a substantial stile, which had often been used as a seat by the weary. A stranger might have guessed he was expecting to meet some one there, and would not have been wrong. It was on the third evening, just as the August sun seemed gathering all the glory of the day towards the crimson and golden west, that the pretty Fanny walked leisurely down the lane, and gave Walter Pierce the meeting of which he was again almost despairing. He sprang eagerly forward the moment she came in sight, and all the warmth of the greeting was on his side. Fanny had dressed herself in some cast-off finery of her young mistress; for though she came to discard a some-time lover, her vanity prompted her to summon all her powers of fascination on the occasion. To tell the truth, however, the faded but smart bonnet, and the soiled silk dress, became her as little as did the affectation of manner she also assumed.

'I declare I did not know you, Mr Pierce,' she exclaimed, withdrawing her hand coldly and decidedly from his lingering grasp; 'you look so different in plain clothes.' And she scanned him from head to foot with a glance that seemed to say, 'It was the red coat after all; I wonder I could have seen anything in the man himself!'

'But my heart is the same, Fanny,' he replied, 'under the soldier's coat or the civilian's;' and his words had a more mournful tone than would have been prompted a few minutes before. Her altered manner had already begun its work.

'It is a very faint heart, at any rate,' said the pert girl with a sneer.

'It thought itself very bold just now,' sighed Walter; 'but I am afraid you are right. I have scarcely the courage left to speak the words I wished you to hear—or the pride,' he added after a moment's pause—'the pride to hide how much you have wounded me.'

Either really a *little* touched, or fearful she had bent the bow too much for her purpose, the coquette relaxed sufficiently to draw on the disclosure she desired; and Walter Pierce poured out his story with the natural eloquence of a true heart.

'I do not ask you,' he exclaimed, after confessing his attachment, 'to share my uncertain fortunes; I do not even ask you to pledge yourself to be mine. But I know that I have energies which, if properly directed, may raise me to some certain position. Then—then—if a year hence you still are free, and I have a prospect of competence from any honest employment, will you, Fanny, dear Fanny—will you give me some hope to lead me on, and cheer me through all my struggles?'

'I thought you had something of this kind to say,' replied she, withdrawing the hand which he had foolishly taken again. 'Honest employment indeed! I suppose you will turn a tailor or a tinker?'

'Well, theirs are both at least as useful, and therefore as honourable, occupations as that of the soldier. But I don't think it likely I shall become either.'

'However, it doesn't signify to me a bit,' continued the girl; 'I wouldn't marry any but a soldier—no, not for the world. And I can tell you I am not the only person you know who has a contempt for all others. Miss Laura says just the same.'

'I am sorry for it,' replied Walter; 'and sorry at—at the mistake I have made.' There was a bitterness in his tone which, but for the sadness which mingled with it, might have seemed contemptuous. The vain and heartless girl felt that she was not altogether a conqueror; and when saying something about the lateness of the hour, and that she must return home, he made no objection to their walking in that direction, it is possible she would have given—what precious thing shall I say?—her smart bonnet to recall the past hour. To such characters as hers, either in high life or low, the repentance for having been deficient in tact is of a very keen sort.

I hope Walter Pierce is the most interesting person introduced to the reader; and yet we must not track his fortunes for a while so narrowly as those of the pretty waiting-maid and her mistress. He journeyed to London we know; and fortunately he was possessed of a little money, which enabled him to look about him, and not plunge, as so many have done from desperation, into an utterly unsuitable occupation. The discipline of the army had to a certain extent unfitted him for any very sedentary employment; but to a much greater degree did it disincline employers from engaging him. Yet he was aided in his career by high principle, and by that moral courage which would dare all things rather than betray it. It might be, too, that the taunts which had reached him in consequence of his withdrawal from the army, had caused him to examine his own heart, till well he knew there was no 'cowardice' there, no deficiency in the power alike of action and endurance—a power which would increase in proportion to the strength of the governing motive. That only is true courage which, seeing and understanding a danger, yet calmly braves it for the achievement of some noble object. How different from the meaner impulse which is often called by its name, but which only arises from ignorance and insensibility, in combination with selfish or angry feelings!

Surely there was some employment in London for which Walter Pierce was eminently fitted. Let us leave him to seek it.

The military predilections of the pretty Fanny induced her, a few months after Walter's departure, to bestow herself upon a 'dashing sergeant,' and enter upon all the honours and some of the trials of 'a soldier's wife.' And not long after this, her young mistress consoled herself for the loss of an efficient waiting-maid, skilful in hairdressing and divers toilet arrangements, by marrying a certain Captain Dormer, an officer belonging to a good

family, and the heir to a large property. Circumstances, however, were destined to bring mistress and servant again into something like their former relative positions, in a manner they had never expected.

Fanny's husband proved bad in the superlative degree; indulging in the curious variations of conduct and treatment by which a bad husband can make utterly miserable the woman he has sworn to love and cherish. Now, there are some natures—not the highest perhaps—which absolutely require a course of suffering to bring out the latent good of their characters, and poor Fanny belonged to this class. Vain, frivolous, and selfish, not till she had suffered herself did she learn to feel for others, and look at human life as it really is. She became a mother too, and this event developed yet more the better feelings of her heart; yet so completely did ill usage wear out any affection she might have entertained for her husband, that the circumstance of his being ordered to India, about two years after their marriage, was a source of rejoicing to her. She absolutely refused to accompany him, preferring to earn a subsistence in England in any capacity which might offer itself. Her old mistress, who had never lost sight of her favourite, was now in want of a servant for her child; and though Fanny's infant was somewhat of an obstacle to her taking a situation as domestic servant, it was one of those obstacles which strong inclination will overcome. It was arranged that Fanny's little one should be placed with a relative; while Mrs Dormer's attachment to her servant, the knowledge of her sorrows, and recollections of their early life, combined to procure her far more indulgence in respect to seeing her child frequently, than she could have expected from a stranger.

Mrs Dormer was scarcely less improved in heart and mind than her humble friend, though she had learned from a gentler teacher than suffering. Hers had been the great good fortune to marry a man of superior mind, who had had the penetration to discover the better qualities of her nature beneath the layer of prejudices and false impressions produced by a neglected education. After all, there is always great hope of correcting the errors of youth, which, I firmly believe, except in cases of natural incapacity or innate depravity, struggles towards the right, and only needs a helping hand to lead it on, instead of what it too often finds, the evil influence of sordid minds and narrow intellects, to lure it into the by-paths of selfish worldliness. In truth, it would not have been very easy to recognise, in the sobered minds and enlarged sympathies of the two young mothers, the selfish, thoughtless girls we first introduced.

Years passed swiftly away; news came often from the East; but, unfortunately, neither gunpowder nor a tropical sun has respect for persons, nor a discretionary power to spare valuable lives and sweep off the worthless. Fanny was still bound to a husband whom she hoped beyond all things never to see again. It might be that sometimes the thought would rise to her mind of how different her fate would have proved had she wedded her early lover; but fortune never threw him in her path, and she was completely ignorant of his fate.

The hitherto happy career of Mrs Dormer was not destined to remain unchequered. On the death of an aged relative, her husband prepared to take possession of a large landed property, to which he was heir, when, to his great dismay, a rival claimant appeared in the field. All the miseries, anxieties, and perplexities of litigation followed; and, in asserting their just rights, the Dormers became cruelly impoverished. Their establishment was reduced as much as possible; but Fanny, true to the better impulses of her heart, remained faithful through all, performing tripled duties upon reduced wages, as many an attached servant—to the honour of the class be it said—has done under similar circumstances. Touched by her fidelity and affection, Mrs Dormer proposed, after a while, receiving her child into the house. Among several children, she said, one other little mouth was not much to feed; but Fanny felt grateful, nevertheless, and with all her manifold labours, she was happier at this period than she had ever been.

After a struggle of three years' duration, the right triumphed, and Captain Dormer was put into possession of certain documents which secured to him the rich estates of his kinsman. With lightened hearts the family paid a visit to London, chiefly that Captain Dormer might arrange legal business, to do which his presence was indispensable. They drove to one of those sumptuous hotels where every comfort and luxury is to be obtained for money, intending the next day to seek a more permanent residence. Wearied by a fatiguing journey, the whole party retired early to rest; but their rest was to be fearfully broken. Just at that dead hour of the night when the sounds of revelry are over, and those of early labour have not commenced, they were aroused by a cry which, of all others, brings with it the greatest terror. 'Fire! fire!' burst upon their half-awakened senses; and starting simultaneously from their beds, they saw a lurid glare from the opposite wing of the building, and felt the suffocating smoke, which was rolling in huge waves towards them!

In a moment of awful agony like this, life, dear life, is the one thing thought of. Seizing the elder children by the hand, Mrs Dormer succeeded in making her way down stairs to a place of safety, whence kind-hearted strangers conducted them to a neighbouring house; and seeing that these dear ones were safe, Captain Dormer burst the door of his servant's room with one blow, and exclaiming, 'My child, my child!—follow me, and save yourself!' he snatched his own youngest one from the cot where it slept by Fanny's side. Fanny attempted to follow with her own child, now a girl of five or six years old, in her arms. But, alas! terror had paralysed her for a moment, and in that moment a wreath of smoke hid Captain Dormer from her sight. Strange as it may seem, the increased danger appeared to sharpen her faculties. She remembered having heard that in an extremity of this sort there is often a stratum of clear air near the ground, though even a few inches above it suffocation would be inevitable. Accordingly, she dragged herself and her child to the floor, and found that, by crawling on hands and knees, it was possible to breathe. The ascending smoke even permitted her to see the feet of chairs and tables, and a portion of the furniture, by which means she made some little advance towards the staircase, her piercing shrieks being heard the whole time above the din of the crowd and the blessed sound of the pouring water; for engines had arrived, and the ever-ready, all-helpful fire brigade!

The period of Fanny's absolute danger might be counted by seconds rather than minutes; and yet did it seem to her an eternity of agony; but at the moment when lingering hope was yielding to frantic despair, she saw a man's strongly-shod feet moving rapidly towards her, and the next instant felt herself and her child caught up by what seemed the arms of a Hercules! As he neared the street with his burden, the cheers of the crowd rose with a deafening shout; but her rescuer tottered on the steps; for, despite his 'smoke-proof' head-gear, he had suffered much; and as some of the bystanders almost tore it off him to afford him air, while others supported Fanny and her child, she recognised in her deliverer the not-to-be-forgotten features of Walter Pierce! He had indeed found an occupation for which, by his noble heart and dauntless courage, he was peculiarly fitted. High in the service of the fire-brigade, it was his to save instead of to slay, and to brave the most frightful death in endeavours to aid the helpless. Oh these true heroes—these brave-hearted men! Every thoughtful heart warms at the contemplation of their doings.

The first violence of the fire abated, and the lapping tongues of flame stayed in their devouring, there was time between thanksgiving for life spared to recognise and bewail the loss of property. Captain Dormer remembered with indescribable agony that a tin box, containing the papers which secured to him his inheritance, was either already consumed, or awaiting certain destruction. Once more Walter Pierce came to the rescue. He heard the description of the box, and was himself the one to draw Captain Dormer back when he was on the point of

rushing into the burning house; for he was a brave man as well as a doting father.

'I must do it,' he exclaimed, struggling with Pierce, 'or my children are beggars.'

'I will go, sir,' replied the other; 'I am a father, and can feel for you. But we are used to these scenes, and heed not the danger.'

So saying, he disappeared from Captain Dormer's sight; but all made way for one of the brigade; and a few minutes afterwards, a moment before the roof fell in, the cheers, not so loud as when life had been rescued, but still hearty cheers, announced that our hero was once more safe and successful.

It was a curious scene which took place the following day, when, in consequence of Captain Dormer's intreaty, Walter Pierce waited upon him at his temporary residence. As was natural, the conversation began by inquiries connected with the catastrophe (though nothing was known with regard to the origin of the fire beyond vague conjecture and imputed carelessness); but in a few minutes Mrs Dormer entered the room, anxious to join with her husband in grateful acknowledgments—having heard from Fanny to *whom* it was they were so much indebted. Though Walter Pierce was somewhat disfigured by the recent singeing of his hair, and a wide scar upon his cheek—the result of a wound received by a falling beam some months before—she recognised him in an instant, sooner even than he remembered her; and she felt that it was not enough to thank him with every expression that could emanate from deep-feeling for his heroic conduct, but to ask pardon for the slights she had put upon him in her girlish days. Prompted by her better feeling, she shook his hand warmly, and acknowledged her early faults, adding, 'There is another who is anxious to see you—one whom, with her only child, you saved last night. Fanny, come in,' she continued; for the trembling woman still paused at the door.

'Fanny! is it possible!' exclaimed Pierce. 'And it was you I saved! This is indeed happiness.'

Poor Fanny would have sunk to the ground, had not Mrs Dormer placed her in a chair.

'Yes, Fanny—dear Fanny, great happiness; for though we both are married—and I only hope you are as happy as I am—I have always thought of you with kindness and interest, and wished that we might meet again. I assure you I have often talked to my wife about my first love.'

'Your wife! And whom have you married!' exclaimed Fanny with some naïveté, and finding it impossible to repress the large amount of feminine curiosity she possessed.

'Why, mine is rather a romantic story,' replied Pierce; 'and if I should not be intruding it on the company, I will tell it as briefly as I can.'

A sign from Mrs Dormer, and exclamations from all, intreated him to proceed.

'I came to London an adventurer, as I think you know; and but a few weeks afterwards, while wandering about the streets one night—for my mind was too restless for me to be still—I had the opportunity of assisting to rescue the inmates of a house in which fire had suddenly burst forth. This put it into my thoughts to offer myself as a recruit for the brigade; and being neither faint of heart nor weak of limb, as I had proved, I was gladly accepted. I was promoted as rapidly as possible; and have, for the last three years, held an office of considerable trust in the corps. With regard to my marriage, it came about thus: I was happy enough to save the life of a tradesman's daughter, a beautiful young woman, and one who unites to a clear and cultivated intellect one of those gentle natures which are usually the greatest admirers of anything like daring courage. You see it was just an accident my saving her—nothing but in the routine of my duty—yet somehow neither she nor her father ever felt it so, nor can I to this day make them understand it. Well, it was what the world would call a match above a poor man; and had I not loved her very dearly—for you see they would invite me constantly, and give me the opportunity of falling in love—I never could have mastered my pride enough to woo her. But you guess the end of the story. We are the happiest couple in the world. I do not think the whole earth contains such another dear little wife; and she thinks, I believe, that the meanest man in the fire-brigade is greater than the generalissimo of the British army. But this perhaps is natural to one who well nigh perished in the smoke of a burning house.'

Perhaps the brave and somewhat blunt Walter Pierce did not think at the moment how peculiarly capable his 'first love' was just then of echoing the sentiments of his wife.

Pierce resolutely refused the roll of bank-notes Dormer strove to press upon him; but the captain managed, a week afterwards, to invest double the sum in the funds for the benefit of a little chubby infant, who took the name of Dormer Pierce.

MR BROOKE IN BORNEO.

MADE RAJAH OF SARĀWAK.

In a former article, we traced the progress of Mr Brooke from the time he entertained the idea of carrying commerce and civilisation into Borneo, to the conclusion of his first visit to Sarāwak, during which he had surveyed a considerable portion of the adjacent country, and acquired a knowledge of its produce and capabilities. We shall now follow him through his second and subsequent visits, which were signalised by the suppression of rebellion and piracy, and finally by his installation as rajah of Sarāwak, with a mixed community of Dyaks, Malays, and Chinese as his subjects.

In August 1840 Mr Brooke landed a second time at Sarāwak, and found his friend Muda Hassim still lingering there, while his forces were endeavouring to quell a rebellion among the Dyak tribes of the interior. The rajah's cause being just, and Mr Brooke feeling that no security could be given to commercial pursuits while the natives were in this distracted state, readily volunteered his assistance, and proceeded to the seat of war with part of his crew, properly equipped for the occasion. This rebellion, although it had continued for more than a year, seems to have been a very paltry affair, and one which a troop of British soldiers would have brought to an issue in a couple of days. The native tribes, though not destitute of personal courage, could never be brought to open conflict, their tactics consisting in taking each other rather by surprise than by valour, and in endeavouring to reduce to a capitulation by threats and blockade. For these purposes, they were continually planting stockade after stockade, and striving to cut off each other from supplies of food and water. Here is a graphic picture of their procedure:—'Dawn found us on the advance to our proper position. A thick fog concealed us, and in half an hour the people were on shore busy re-erecting our fort, less than a mile from two forts of the enemy, but concealed from them by a point of the river. No opposition was offered to us; and in a few hours a neat defence was completed from the debris of the former. The ground was cleared of jungle; piles driven in a square, about fifteen yards to each face, and the earth from the centre, scooped out and intermixed with layers of reeds, was heaped up about five feet high inside the piles. At the four corners were small watch-towers, and along the parapet of earth a narrow walk connecting them. In the centre space was a house crowded by the Chinese garrison, a few of whose harmless gingalls were stuck up at the angles, to intimidate rather than to wound. Whilst they laboured at the body of the defence, the Dyaks surrounded it by an outer-work, made of slight sticks run into the ground, with cross-binding of split bamboo, and bristling with a *chevaux de frise* (if it may be so styled) of sharpened bamboos about breast-high. The fastenings of the entire work were of rattan, which is found in plenty. It was commenced at 7 A.M., and finished about 3 P.M., showing how the fellows can get through business when they choose. This stockade, varying in

strength according to circumstances, is the usual defence of the Sambas Chinese. The Malays erect a simple and quicker-constructed protection by a few double uprights, filled in between with timber laid lengthwise, and supported by the uprights. Directly they are under cover, they begin to form the ranjows or sudas, which are formidable to naked feet, and stick them about their position. Above our station was a hill which entirely commanded both it and the river; to the top of which I mounted, and obtained an excellent view of the country around, including the enemy's forts and the town of Siniawan. A company of military might finish the war in a few hours, as these defences are most paltry, the strongest being the fort of Balidah, against which our *formidable* assault was to be levelled. It was situated at the water's edge, on a slight eminence on the right bank of the river, and a large house with a thatched roof, and a look-out house on the summit; a few swivels and a gun or two were in it, and around it a breastwork of wood—judging from a distance, about six or seven feet high. The other defences were more insignificant even than this; and the enemy's artillery amounted, by account, to three six-pounders and numerous swivels; from three hundred and fifty to five hundred men, about half of whom were armed with muskets, whilst the rest carried swords and spears. They were scattered in many forts, and had a town to defend, all of which increased their weakness. Their principal arm, however, consisted in the ranjows, which were stated to be stuck in every direction. These ranjows are made of bamboo, pointed fine, and stuck in the ground; and there are, besides, holes about three feet deep, filled with these spikes, and afterwards lightly covered, which are called patobong. Another obstacle consists of a spring formed by bending back a stiff cane with a sharp bamboo attached to it, which, fastened by a slight twine, flies forcibly against any object passing through the bush and brushing against it: they resemble the mole-traps of England. The Borneons have a great dread of these various snares, and the way they deal with them is by sending out parties of Dyaks during the night to clear the paths from such dangers.'

In this way the opposing parties went on stockading, till they were within parley, and then, like the heroes of old, they bullied each other. 'We are coming, we are coming,' exclaimed the rebels; 'lay aside your muskets, and fight us with swords.' 'Come on,' was the reply; 'we are building a stockade, and want to fight you.' And so the heroes ceased to talk, but forgot to fight, except that the rebels opened a fire from Balidah with swivels, all of which went over the tops of the trees. This mode of bullying and stockading at length exhausted the patience of Mr Brooke, who was, in reality, the commander-in-chief of the grand army, and he therefore insisted on carrying the town by storm. This, however, the native leaders regarded as little short of insanity: one talked of the loss of heads which such rashness would occasion, though only one man had yet fallen in the campaign; another talked of erecting forts in the surrounding trees, and 'puff, puffing' down into Balidah, accompanying the words 'puff, puff,' with expressive gestures of firing. None of them, however, would budge; and so Mr Brooke collected his artillery, and dropped down the river to Sarāwak. The rajah was so alarmed at this loss, that he offered a large tract of his territory if the English would only stay and assist him in this difficulty; he would accompany them in person, and see that Balidah was carried by assault, even should he fall in the attempt. Mr Brooke was thus induced again to equip part of his crew, and re-ascend the river—the rajah's brother, and not himself, accompanying the party. It was now a couple of months since he had left the seat of war, and when he arrived again, he found the grand army in a state of torpor—eating, drinking, and walking up to the forts daily; but having erected these imposing structures, and their appearance not driving the enemy away, they were at a loss what to do next, or how to proceed. On his arrival, he once more insisted on mounting the guns in their former positions, and assaulting Balidah under their fire—a measure which was only carried into effect under the overawing presence of the rajah's brother. By this means the enemy were driven from their citadel, and in a few days from the whole of their surrounding stockades; upon which they capitulated, in hopes of being spared through the interference of the English. And in this the reader will be glad to learn that Mr Brooke was successful, though not before he had actually made preparations to leave Sarāwak, and threatened to bid the reluctant rajah a final farewell.

Having thus put an end to the rebellion—which, paltry as it may appear to us, was in reality a source of great misery to the parties concerned, as their tedious tactics interrupt trade, and reduce all to a state of starvation—Mr Brooke next directed his attention to commercial negotiations with Muda Hassim. In these, after a visit with the Royalist to the sultan of Borneo, and a further survey of the country, he was eminently successful; so much so, indeed, that he obtained a right of free trading not only for the English and other people, but was offered the government of Sarāwak and surrounding district, the rajah contending that commerce could not be better carried on than under the superintendence of the individual who had made the proposal. Waiving the latter offer in the meantime, Mr Brooke set sail for Sincapore, with the view of obtaining a cargo of such wares as would be acceptable to the Borneons—expecting antimony ore, birds' nests, rattans, and other native produce in exchange. For this purpose he freighted the Swift, a small schooner of ninety tons, which, in company with the Royalist, entered the waters of the Sarāwak in May 1841. Here, however, his difficulties commenced—difficulties, disappointments, and breaches of faith which would have damped the ardour of any one less honest and cordial in his intentions. A house and wareroom had been promised him on his return: this was not even commenced: antimony ore, to the amount of 6000 peculs, was to be in readiness: scarcely a pound, however, was collected. This was unjust and ungenerous on the part of the rajah—naturally an indolent and weak-minded man, who had been tampered with by several of his pangerans. Nothing daunted, Mr Brooke landed his cargo, overhauled his vessels, and in the meantime urged his suit. He had brought to a happy conclusion a war that had baffled the rajah, and devastated the country for four years; he had, moreover, elevated him in the respect of his people; had reinstated him in favour (by the successful issue of the war) with his uncle, the sultan of Borneo; and for all this, was he to be duped and cheated? Besides, he had been assured of the rajah's protection and encouragement to commerce; had been promised a residence and cargo; nay, had been offered the government of the country—an offer which he rejected, seeing that it was made under the pressure of the war, and might have been thus regarded as other than a free and voluntary concession. To this reasoning Muda Hassim was all attention; admitted it in full; urged the disaffection of some of his pangerans; but promised immediate redress. Mr Brooke's residence was accordingly built, and part of the ore collected and shipped. But his cargo, which had been handed over to the rajah, and divided among his followers, was not yet one-fourth reimbursed; and what, under these circumstances, was he to do?

In this juncture, one cannot help admiring the patience, the fortitude, and knowledge of human nature which our hero displays. He resolves to despatch the Swift to Sincapore with what cargo she had obtained; to send off the Royalist, and dispose of her; and himself, with three or four faithful followers, to await the issue, trusting to reason and example over Muda Hassim, and willing to sacrifice all for the regeneration of a people not naturally evil-disposed, and of a country one of the most fertile in the world. But the services of the Royalist are required: pirate tribes threaten to

ascend the Sarāwak, and these must be repulsed. News reach him that the crews of certain shipwrecked English vessels are at Borneo in great distress, and that others are dispersed in slavery along the coast: these, God willing, must be released. The Royalist is therefore despatched on these missions of mercy, and Mr Brooke directs, encourages, and reforms at Sarāwak—the rajah and he having become sworn friends and brothers. During the absence of the Royalist Mr Brooke ascends several of the rivers, examines the country, hunts, makes the acquaintance of the native tribes, listens to their tales of distress, intercedes for them with Muda Hassim, and in almost every case is successful. At length the Royalist arrives, having released the shipwrecked captives—Sarāwak is visited by a steamer from Sincapore—and everything tends favourably to strengthen the position of our philanthropic countryman. Passing, therefore, over many interesting visits to the interior, and descriptions of native customs, as well as over much preliminary diplomacy, we come at last to the cessation of Sarāwak—a district sixty miles coastwise, and about fifty in average breadth—in perpetuity to Mr Brooke, who was consequently installed 'rajah,' with the customary native ceremonies, on the 1st of August 1842.

Our space will not permit us to detail the wise and benevolent laws which Mr Brooke promulgated on the occasion; suffice it to state that, respecting as far as possible the native customs, his endeavour was to establish liberty to all, free right to labour and its produce, equal justice to the poorest Dyak and most powerful Malay, and a fixed taxation instead of arbitrary and overreaching avarice. Under these circumstances, he thus journalises on the 1st of January 1843:—'Another year past and gone; a year, with all its anxieties, its troubles, its dangers, upon which I can look back with satisfaction—a year in which I have been usefully employed in doing good to others. Since I last wrote, the Dyaks have been quiet, settled, and improving; the Chinese advancing towards prosperity; and the Sarāwak people wonderfully contented and industrious, relieved from oppression, and fields of labour allowed them. Justice I have executed with an unflinching hand; and the amount of crime is certainly small—the petty swindling very great.

'I have nothing to say about the country, except that I have given Pangeran Macota orders to leave, which he is obeying in as far as preparing his boat; and I hope that in six weeks we shall be rid of his cunning and diabolically-intriguing presence. The Rajah Muda Hassim, his brothers, and the tag-rag following, I also hope soon to be rid of; for although they behave far better than they did at first, it is an evil to have wheel within wheel; and these young rajahs of course expect, and are accustomed to, a license which I will not allow. Budrudeen is an exception—a striking and wonderful instance of the force of good sense over evil education. The rest of the people go on well; the time revolves quietly; and the Dyaks, as well as the Malays and Chinese, enjoy the inestimable blessings of peace and security. At intervals a cloud threatens the serenity of our political atmosphere; but it speedily blows over. However, all is well and safe; so safe, that I have resolved to proceed in person to Sincapore.

'My motives for going are various; but I hope to do good, to excite interest, and make friends; and I can find no season like the present for my absence. It is now two years since I left Sincapore, "the boundary of civilisation." I have been out of the civilised world, living in a demi-civilised state, peaceably, innocently, and usefully.'

Having visited Sincapore in the spring of 1843—where, no doubt, he represented the capabilities of his acquired country, and the commercial advantages likely to accrue from it, as well as the difficulties which would be experienced so long as piracy was suffered to prevail in the Indian Archipelago—we find him returning to Sarāwak on board her majesty's ship Dido, commanded by the Hon. Captain Keppel. This vessel had been ordered to visit Borneo and the adjacent islands, for the suppression of piracy—a mission which, in the course of a few months, she had so far fulfilled, that every piratical stronghold on the north coast was annihilated, and the ruffianly hordes dispersed. We cannot follow Captain Keppel in his spirited account of his rencontres with the pirates; but the following extract from Mr Brooke's journal will afford some idea of the nature and character of a piratical fleet; for in the East piracy is not a single effort, but a system of sea-life not unlike that of the old Scandinavian rovers:—'In the evening I pulled through the fleet, and inspected several of the largest prahus. The entire force consisted of eighteen boats; namely, three Malukus and fifteen Illanuns: the smallest of these boats carried thirty men, the largest (they are mostly large) upwards of a hundred; so that, at a moderate computation, the number of fighting men might be reckoned at from five to six hundred. The Illanun expedition had been absent from Magindano upwards of three years, during which time they had cruised amongst the Moluccas and islands to the eastward, had haunted Boni Bay and Celebes, and beat up the Straits of Makassar. Many of their boats, however, being worn out, they had fitted out Bugis prize prahus, and were now on their return home. They had recently attacked one of the Tambelan islands, and had been repulsed; and report said they intended a descent upon Sirhassan, one of the southern Natunas group. These large prahus are too heavy to pull well, though they carry thirty, forty, and even fifty oars: their armament is one or two six-pounders in the bow, one four-pounder stern-chaser, and a number of swivels, besides musketry, spears, and swords. The boat is divided into three sections, and fortified with strong planks, one behind the bow, one amidships, and one astern, to protect the steersman. The women and children are crammed down below, where the unhappy prisoners are likewise stowed away during an action. Their principal plan is boarding a vessel, if possible, and carrying her by numbers; and certainly if a merchantman fired ill, she would inevitably be taken; but with grape and canister fairly directed, the slaughter would be so great, that they would be glad to sheer off before they neared a vessel. This is, of course, supposing a calm; for in a breeze they would never have the hardihood to venture far from land with a ship in sight, and would be sorry to be caught at a distance. Their internal constitution is as follows:—One chief, a man usually of rank, commands the whole fleet; each boat has her captain, and generally from five to ten of his relations, free men; the rest, amounting to above four-fifths, are slaves, more or less forced to pursue this course of life. They have, however, the right of plunder, which is indiscriminate, with certain exceptions; namely, slaves, guns, money, or any other heavy articles, together with the very finest description of silks and cloths, belonging to the chiefs and free men; and the rest obey the rule of "first come, first served." No doubt the slaves become attached to this predatory course of life: but it must always be remembered that they are slaves, and have no option; and it appears to me that, in the operation of our laws, some distinction ought to be drawn on this account, to suit the circumstances of the case. The datus, or chiefs, are incorrigible; for they are pirates by descent, robbers from pride as well as taste, and they look upon the occupation as the most honourable hereditary pursuit. They are indifferent to blood, fond of plunder, but fondest of slaves: they despise trade, though its profits be greater; and, as I have said, they look upon this as their "calling," and the noblest occupation of chiefs and free men. Their swords they show with boasts, as having belonged to their ancestors, who were pirates, renowned and terrible in their day; and they always speak of their ancestral heir-loom as decayed from its pristine vigour, but still the wielding of it as the highest of earthly existences. That it is, in

reality, the most accursed, there can be no doubt; for its chief support are slaves they capture on the different coasts. If they attack an island, the women and children, and as many of the young men as they require, are carried off. Every boat they take furnishes its quota of slaves; and when they have a *full cargo*, they quit that coast or country, and visit another, in order to dispose of their human spoil to the best advantage.'

Since the expedition of the Dido, other war-vessels have cruised in the Asiatic Archipelago—all tending to suppress piracy, and encourage native trade and commerce. The island of Labuan, off Borneo, has been ceded to England, and Mr Brooke appointed agent for the British government—an appointment which confers on him additional power and influence. Thus, in the course of five short years, has a complete revolution been worked in one of the fairest portions of our globe, and a new and better system of things been established, all through the enlightened and philanthropic energy of a single individual—showing how much can really be accomplished when an honest, cordial, and unselfish nature is engaged in a holy cause. We regard the proceedings of Mr Brooke as the commencement of a new era in the history of the Indian Archipelago—an era which, under the favour of more enlightened views at home, is yet destined to realise all that was planned and propounded by his model and prototype, Sir Stamford Raffles.

JOTTINGS FROM HUME'S LIFE AND CORRESPONDENCE.*

A work in two large volumes on the life of an eminent philosopher, is not fit subject for treatment in these pages. We merely propose—with a general acknowledgment of the industry, judgment, and good taste of the author—to run trippingly over a few of the more lively and appreciable points of his work, aiming rather to amuse an idle half hour for our readers, than to afford them an insight into the recesses of a profound subject.

It will be new to the public at large, that David Hume was ever in love, or ever wrote poetry; but Mr Burton brings forward evidence for both conclusions. The following is a specimen of his verses—written to a lady who expressed a suspicion that the friendship of men to her sex always concealed a more dangerous passion:—

'Hang, my lyre, upon the willow,
Sigh to winds thy notes forlorn,
Or along the foaming billow,
Float, the wrecking tempest's scorn.

Airs no more thy warbling raises,
Such as Laura deigns approve;
Laura scorns her poet's praises;
Artless friendship—calls it love.

Impious love, that, spurning duty,
Spurning nature's chastest ties,
Mocks thy tears, dejected beauty,
Sports with fallen virtue's sighs.

Call it love no more, profaning
Truth with dark suspicion's wound;
Or, if still the term retaining,
Change the sense, preserve the sound.

Yes, 'tis love, that name is given,
Angels, to your purest flames;
Such a love as merits heaven,
Heaven's divinest image claims.'

Perhaps the love of Mr Hume rarely or never exceeded these very spiritual limits. As not irrelevant to the subject, we may cite a passage from a letter, written in 1748, in which he gives an account of the love affair of another intellectual person—*Pope's* Earl of Marchmont.

'Lord Marchmont has had the most extraordinary adventure in the world. About three weeks ago he was at the play, where he espied in one of the boxes a fair virgin, whose looks, air, and manner, made such a powerful and wonderful effect upon him, as was visible to every bystander. His raptures were so undisguised, his looks so expressive of passion, his inquiries so earnest, that everybody took notice of it. He soon was told that her name was Crompton, a linen-draper's daughter, that had been bankrupt last year, and had not been able to pay above five shillings in the pound. The fair nymph herself was about sixteen or seventeen, and being supported by some relations, appeared in every public place, and had fatigued every eye but that of his lordship, which, being entirely employed in the severer studies, had never till that fatal moment opened upon her charms. Such and so powerful was their effect, as to be able to justify all the Pharamonds and Cyruses in their utmost extravagances. He wrote next morning to her father, desiring leave to visit his daughter on honourable terms; and in a few days she will be Countess of Marchmont.* All this is certainly true. They say many small fevers prevent a great one. Heaven be praised that I have always liked the persons and company of the fair sex! for by that means I hope to escape such ridiculous passions. But could you ever suspect the ambitious, the severe, the bustling, the impetuous, the violent Marchmont, of becoming so tender and gentle a swain—an Artamenes, an Oroondates?'

Somewhat later (1751), he has to tell a lady friend (Mrs Dysart) that his elder brother, the laird of Ninewells, is married, and that he and his sister will consequently have to quit the paternal mansion. We give some droll passages of the letter:—'Our friend at last plucked up a resolution, and has ventured on that dangerous encounter. He went off on Monday morning; and this is the first action of his life wherein he has engaged himself, without being able to compute exactly the consequences. But what arithmetic will serve to fix the proportion between good and bad wives, and rate the different classes of each? Sir Isaac Newton himself, who could measure the course of the planets, and weigh the earth as in a pair of scales—even he had not algebra enough to reduce that amiable part of our species to a just equation; and they are the only heavenly bodies whose orbits are as yet uncertain. * * Since my brother's departure, Katty and I have been computing in our turn, and the result of our deliberation is, that we are to take up house in Berwick; where, if arithmetic and frugality don't deceive us (and they are pretty certain arts), we shall be able, after providing for hunger, warmth, and cleanliness, to keep a stock in reserve, which we may afterwards turn either to the purposes of hoarding, luxury, or charity. * * My compliments to his solicitorship.† Unfortunately I have not a horse at present to carry my fat carcase to pay its respects to his superior obesity. But if he finds travelling requisite either for his health or the captain's, we shall be glad to entertain him here, as long as we can do it at another's expense; in hopes we shall soon be able to do it at our own.

'Pray tell the solicitor that I have been reading lately, in an old author called Strabo, that in some cities of ancient Gaul there was a fixed legal standard established for corpulency; and that the senate kept a measure, beyond which, if any belly presumed to increase, the proprietor of that belly was obliged to pay a fine to the public, proportionable to its rotundity. Ill would it fare with his worship and I if such a law should pass our parliament; for I am afraid we are already got beyond the statute.

'I wonder, indeed, no harpy of the treasury has ever thought of this method of raising money. Taxes on luxury are always most approved of; and no one will say that the carrying about a portly belly is of any use

* Life and Correspondence of David Hume, from the papers bequeathed by his nephew to the Royal Society of Edinburgh, and other original sources. By John Hill Burton, Esq. Advocate. 2 vols. 8vo. Edinburgh: W. Tait. 1846.

* The marriage took place accordingly on the day following the date of the letter; namely, 30th January. She was the second wife of Lord Marchmont; his first countess, whose name was Western, having died on 9th May of the previous year.

† Alexander Home, solicitor-general for Scotland.

or necessity. 'Tis a mere superfluous ornament; and is a proof, too, that its proprietor enjoys greater plenty than he puts to a good use; and therefore 'tis fit to reduce him to a level with his fellow-subjects, by taxes and impositions.

'As the lean people are the most active, unquiet, and ambitious, they everywhere govern the world, and may certainly oppress their antagonists whenever they please. Heaven forbid that Whig and Tory should ever be abolished; for then the nation might be split into fat and lean; and our faction, I am afraid, would be in piteous taking. The only comfort is, if they oppressed us very much, we should at last change sides with them.'

It appears that his housekeeping, after all, began two years later in Edinburgh, where he had procured the situation of keeper of the Advocates' Library, with a salary of forty pounds a-year. 'I shall exult and triumph to you a little,' he says to Dr Clephane, 'that I have now at last—being turned of forty, to my own honour, to that of learning, and to that of the present age—arrived at the dignity of being a householder. About seven months ago I got a house of my own, and completed a regular family; consisting of a head, namely, myself, and two inferior members, a maid and a cat. My sister has since joined me, and keeps me company. With frugality I can reach, I find, cleanliness, warmth, light, plenty, and contentment. What would you have more? Independence?—I have it in a supreme degree. Honour?—that is not altogether wanting. Grace?—that will come in time. A wife?—that is none of the indispensable requisites of life. Books?—that *is* one of them, and I have more than I can use. In short, I cannot find any blessing of consequence which I am not possessed of, in a greater or less degree; and without any great effort of philosophy, I may be easy and satisfied.' The scene of this singular contentment was 'Riddel's Land, Lawnmarket,' probably a portion of a floor of one of those lofty composite houses which abound in Edinburgh. But Hume was more than an easily-satisfied man. He had a true independence of spirit, directing him, in narrow circumstances, to be a burden to no one; and though needful of means, and possessed of talents for many profitable drudgeries, he so loved letters, that for their sake he could endure any degree of poverty.

When our philosopher had a thousand pounds, he thought himself independent. In 1756, when forty-five years of age, and after the first volume of his history of England had appeared, he plumed himself on having a fortune of L.1600, producing, at five per cent., the pay of two French captains. But these traits of scholarly simplicity are nothing to what we hear of his friend Wilkie, a clerical poet, who, when assistant minister of Ratho, had twenty pounds a-year, and 'could not conceive what article, either of human conveniency or pleasure, he was deficient in, nor what any man could mean by desiring more money.' This man, who was immensely erudite, had originally been a farmer. 'Two or three years ago,' says Hume, 'Jemmy Russel put a very pleasant trick on an English physician, one Dr Roebuck, who was travelling in this country. Russel carried him out one day on horseback to see the outlets of the town, and purposely led him by Wilkie's farm. He saw the bard at a small distance, sowing his corn, with a sheet about him, all besmeared with dirt and sweat, with a coat and visage entirely proportioned to his occupation. Russel says to his companion, "Here is a fellow, a peasant, with whom I have some business: let us call him." He made a sign, and Wilkie came to them. Some questions were asked him with regard to the season, to his farm and husbandry, which he readily answered; but soon took an opportunity of digressing to the Greek poets, and enlarging on that branch of literature. Dr Roebuck, who had scarce understood his rustic English, or rather his broad Scotch, immediately comprehended him, for his Greek was admirable; and on leaving him, he could not forbear expressing the highest admiration to Russel, that a clown, a rustic, a mere hind—such as he saw this fellow was—should be possessed of so much erudition. "Is it usual," says he, "for your peasants in Scotland to read the Greek poets?" "Oh yes," replies Russel very coolly; "we have long winter evenings; and in what can they employ themselves better than in reading the Greek poets?" Roebuck left the country in a full persuasion that there are at least a dozen farmers in every parish who read Homer, Hesiod, and Sophocles every winter evening to their families; and if ever he writes an account of his travels, it is likely he will not omit so curious a circumstance.'

It is interesting to find Hume, after several blazing years of *lionization* at Paris, and acting there for a time as the British ambassador, returning (1769) to his little mansion in James's Court, Edinburgh, and joining once more in the homely and familiar society of his old friends. He thus addresses his friend Adam Smith, who was then composing his treatise on the Wealth of Nations in an equally humble mansion at Kirkaldy. The letter gives an odd idea of the difficulties which then beset a ferry, now traversed hourly by well-appointed steamers. 'I am glad to have come within sight of you, and to have a view of Kirkaldy from my windows; but as I wish also to be within speaking terms of you, I wish we could concert measures for that purpose. I am mortally sick at sea, and regard with horror, and a kind of hydrophobia, the great gulf* that lies between us. I am also tired of travelling, as much as you ought naturally to be of staying at home. I therefore propose to you to come hither and pass some days with me in this solitude. I want to know what you have been doing; and propose to exact a rigorous account of the method in which you have employed yourself during your retreat. I am positive you are in the wrong in many of your speculations, especially where you have the misfortune to differ from me. All these are reasons for our meeting, and I wish you would make me some reasonable proposal for that purpose. There is no habitation on the island of Inchkeith, otherwise I should challenge you to meet me on that spot, and neither of us ever to leave the place till we were fully agreed on all points of controversy. I expect General Conway here to-morrow, whom I shall attend to Roseneath, and I shall remain there a few days. On my return, I expect to find a letter from you, containing a bold acceptance of this defiance.'

To Sir Gilbert Elliot of Minto, grandfather of the present Earl of Minto, he thus playfully details some of his studies at this time:—'I have been settled here two months, and am here body and soul, without casting the least thought of regret to London, or even to Paris. I think it improbable that I shall ever in my life cross the Tweed, except, perhaps, a jaunt to the north of England for health or amusement. I live still, and must for a twelvemonth, in my old house in James's Court, which is very cheerful, and even elegant, but too small to display my great talent for cookery, the science to which I intend to addict the remaining years of my life! I have just now lying on the table before me a receipt for making *soupe à la reine*, copied with my own hand: for beef and cabbage (a charming dish), and old mutton, and old claret, nobody excels me. I make also sheep-head broth in a manner that Mr Keith speaks of it for eight days after; and the Duc de Nivernois would bind himself apprentice to my lass to learn it. I have already sent a challenge to David Moncreif: you will see that in a twelvemonth he will take to the writing of history, the field I have deserted; for, as to the giving of dinners, he can now have no further pretensions. I should have made a very bad use of my abode in Paris, if I could not get the better of a mere provincial like him. All my friends encourage me in this ambition, as thinking it will redound very much to my honour.'

Here it may be pertinent to introduce the following remarks of the author:—'The impression of Hume's

* The Firth of Forth.

character, acquired by one who has sought it in the tenor of his works, and the history of his literary career, is quite different from that which we derive from those who knew him, and were connected with the social circle in which he lived. The former is solitary, self-relying, and unimpressible even to sternness; the latter is good, easy, simple, social, and amenable to the sway of gentle impulses. These two representations are not without a harmony of principle. In all serious matters, in his projects of literary ambition, in the philosophy he taught mankind, in all that was to connect him with posterity and the intellectual destiny of the human race, he was resolute and uncompromising. But the exhibition of his strength was reserved for the arena of his triumphs; and in domestic and social intercourse he put aside his helmet, with its nodding plumes; feeling that the intellectual exhibitions suited for *that* sphere, should spring from whatever Nature had bestowed on him of sweet, and peaceful, and kind—whatever was fitted to drive rancour or angry emulation from the bosom, and to render life delightful. Hence to appear in the social circle as an intellectual gladiator, does not appear to have been his wish; he was content if he gave himself and others pleasure.' On the same point we have some memoranda from the late Chief Commissioner Adam, who had known Hume in his boyhood:—'In all the intercourse of life, and in all he said, and wrote, and did, when not employed in his unnecessary metaphysical scepticism (well-named by a friend of mine intellectual rope-dancing), he was innocent, playful, and moral, and most natural in his conversation: equally pleasing and instructive to the young and old of both sexes. He could bring himself down, without effort, to the most familiar playfulness with young persons; and particularly delighted in the conversation of youthful females.

'Mr Hume was one of our constant visitors, making, as was the custom of those days, tea-time the hour of calling. In the summer he would often stroll to my father's beautiful villa of North Merchiston. On one occasion—I was then a boy of thirteen—he, missing my mother, made his tea-drinking good with two or three young ladies of eighteen or nineteen (his acquaintances), who were my mother's guests. I recollect perfectly how agreeably he talked to them; and my recollection has been rendered permanent by an occurrence which caused some mirth and no mischief. When the philosopher was amusing himself in conversation with the young ladies, the chair began to give way under him, and gradually brought him to the floor. The damsels were both alarmed and amused, when Mr Hume, recovering himself, and getting upon his legs, said in his broad Scotch tone, but in English words (for he never used Scotch), "Young ladies, you must tell Mr Adam to keep stronger chairs for heavy philosophers."'

SUMNER'S PEACE ORATION.

The 4th of July has been set apart by the people of the United States as a national holiday, in commemoration of the achievement of their political independence, and is in some parts of the country signalised by public assemblages, at which an oration of a patriotic kind is delivered. On the last occasion of this anniversary in the city of Boston, the customary oration was delivered to a large audience by Charles Sumner, an American-born citizen; and, to the surprise of all present, it consisted of a fearless denunciation of war, on general grounds, as well as in special reference to its fatal encouragement by the citizens of the United States. The satisfaction with which the address inspired the local authorities having led to its publication, under the title of the 'True Grandeur of Nations,' copies have reached England, and a pamphlet, purporting to be extracts from the original, has been just issued by the committee of the Liverpool Peace Society.

Those living remote from large towns in Great Britain, are probably not aware that latterly, in various places, there has been a considerable, though not obtrusive movement, against the principle and practice of war, and in favour of universal peace. Observing with pleasure the daily progress of humane sentiment, we can have little hesitation in saying that this anti-war movement is likely to increase in volume and power, and, in the long run, to be effectual for its object. To all who feel interested in the great destinies of our race, such a movement will be cheering in no ordinary degree, and everything which marks its progress must be to them a matter of the deepest concern. Desirous of aiding, however feebly, a cause so grand and momentous, we beg to make our readers acquainted with the oration of Mr Sumner, which for taste, eloquence, and scholarship, as well as for fearless intrepidity, has been rarely equalled in modern harangues. Mr Sumner states, in commencing, that he does not propose to pass judgment on the wars in which his country has already been engaged. On each occasion the people acted in accordance with the notions in which they had been educated; but now they are able to recognise the supremacy of the moral faculties, and to despise an appeal to brute force for the settlement of their quarrels. 'In *our* age,' he proceeds, 'there can be no peace that is not honourable; there can be no war that is not dishonourable. The true honour of a nation is to be found only in deeds of justice and in the happiness of its people, all of which are inconsistent with war. In the clear eye of Christian judgment, vain are its victories; infamous are its spoils. He is the true benefactor, and alone worthy of honour, who brings comfort where before was wretchedness; who dries the tear of sorrow; who pours oil into the wounds of the unfortunate; who feeds the hungry and clothes the naked; who unlooses the fetters of the slave; who does justice; who enlightens the ignorant; who enlivens and exalts, by his virtuous genius, in art, in literature, in science, the hours of life; who, by words or actions, inspires a love for God and for man. This is the Christian hero; this is the man of honour in a Christian land. He is no benefactor, nor deserving of honour, whatever may be his worldly renown, whose life is passed in acts of force; who renounces the great law of Christian brotherhood; whose vocation is blood; who triumphs in battle over his fellow-men. Well may old Sir Thomas Browne exclaim, "The world does not know its greatest men;" for thus far it has chiefly discerned the violent brood of battle, the armed men springing up from the dragon's teeth sown by hate, and cared little for the truly good men, children of love, Cromwells guiltless of their country's blood, whose steps on earth have been as noiseless as an angel's wing. It is not to be disguised that these views differ from the generally received opinions of the world down to this day. The voice of man has been given mostly to the praise of military chieftains, and the honours of victory have been chanted even by the lips of woman. The mother, while rocking her infant on her knees, has stamped on his tender mind, at that age more impressible than wax, the images of war; she has nursed his slumbers with its melodies; she has pleased his waking hours with its stories; and selected for his playthings the plume and the sword. The child is father to the man; and who can weigh the influence of these early impressions on the opinions of later years? The mind which trains the child is like the hand which commands the end of a long lever; a gentle effort at that time suffices to heave the enormous weight of succeeding years. As the boy advances to youth, he is fed, like Achilles, not only on honey and milk, but on bear's flesh and lion's marrow. He draws the nutriment of his soul from a literature whose beautiful fields have been moistened by human blood. And when the youth becomes a man, his country invites his services in war, and holds before his bewildered imagination the highest prizes of honour. For him is the pen of the historian and the verse of the poet. His soul swells at the thought that he also is a soldier; that his name shall be entered on the list of those who have borne arms in the cause of their country;

and perhaps he dreams that he too may sleep, like the Great Captain of Spain, with a hundred trophies over his grave.'

With regard to the character of war, it is clearly an attempt, on the part of two nations, to overpower each other by force. 'Reason, and the divine part of our nature, in which alone we differ from the beasts; in which alone we approach the Divinity; in which alone are the elements of justice, the professed object of war, are dethroned. It is, in short, a temporary adoption, by men, of the character of wild beasts, emulating their ferocity, rejoicing like them in blood, and seeking, as with a lion's paw, to hold an asserted right. This character of war is somewhat disguised, in more recent days, by the skill and knowledge which it employs; it is, however, still the same, made more destructive by the genius and intellect which have been degraded to its servants. The early poets, in the unconscious simplicity of the world's childhood, make this strikingly apparent. All the heroes of Homer are likened, in their rage, to the ungovernable fury of animals or things devoid of human reason or human affection.' Modern literature is full of many such allusions.

The orator considers the consequences of a resort to this brute force in the pursuit of justice. 'The immediate effect of war is to sever all relations of friendship and commerce between the two nations, and every individual thereof, impressing upon each citizen or subject the character of enemy. Imagine this between England and the United States. The innumerable ships of the two countries—the white doves of commerce, bearing the olive of peace—would be driven from the sea, or turned from their proper purposes, to be ministers of destruction; the threads of social and business intercourse, which have become woven into a thick web, would be suddenly snapped asunder; friend could no longer communicate with friend; the twenty thousand letters which each fortnight are speeded from this port alone across the sea, could no longer be sent; and the human affections and desires, of which these are the precious expression, would seek in vain for utterance. Tell me, you who have friends and kindred abroad, or who are bound to foreigners by the more worldly relations of commerce, are you prepared for this rude separation?' But this is nothing in comparison to the scenes of horror caused by war. 'At Tarragona, above six thousand human beings, almost all defenceless, men and women, gray hairs and infant innocence, attractive youth and wrinkled age, were butchered by the infuriated troops in one night, and the morning sun rose upon a city whose streets and houses were inundated with blood. And yet this is called "a glorious exploit." This was a conquest by the French. At a later day, Ciudad Rodrigo was stormed by the British, when there ensued, in the license of victory, a frightful scene of plunder and violence, while shouts and screams on all sides fearfully intermingled with the groans of the wounded. The churches were desecrated, the cellars of wine and spirits were pillaged, fire was wantonly applied to different parts of the city, and brutal intoxication spread in every direction. It was only when the drunken men dropped from excess, or fell asleep, that any degree of order was restored; and yet the storming of Ciudad Rodrigo is pronounced [by Alison] "one of the most brilliant exploits of the British army." This exploit was followed by the storming of Badajoz, in which the same scenes were enacted again with added atrocities. Let the story be told in the words of a partial historian [Napier]: "Shameless rapacity, brutal intemperance, savage lust, cruelty and murder, shrieks and piteous lamentations, groans, shouts, imprecations, the hissing of fire bursting from the houses, the crashing of doors and windows, and the report of muskets used in violence, resounded for two days and nights in the streets of Badajoz! On the third, when the city was sacked, when the soldiers were exhausted by their excesses, the tumult rather subsided than was quelled! The wounded were then looked to—the dead disposed of."'

After some further illustrations of the same kind, Mr Sumner refers to the terrific sufferings of Genoa at the close of last century. 'In the autumn of 1799, the armies of the French Republic, which had dominated over Italy, were driven from their conquests, and compelled, with shrunk forces, under Massena, to seek shelter within the walls of Genoa. After various efforts by the Austrian general on the land, aided by a bombardment from the British fleet in the harbour, to force the strong defences by assault, the city is invested by a strict blockade. All communication with the country is cut off on the one side, while the harbour is closed by the ever-wakeful British watch-dogs of war. Within the beleaguered and unfortunate city are the peaceful inhabitants, more than those of Boston in number, besides the French troops. Provisions soon become scarce, scarcity sharpens into want, till full famine, bringing blindness and madness in her train, rages like an Erinnys. Picture to yourself this large population, not pouring out their lives in the exulting rush of battle, but wasting at noonday—the daughter by the side of the mother, the husband by the side of the wife. When grain and rice fail, flax-seed, millet, cocoas, and almonds, are ground by hand-mills into flour; and even bran, baked with honey, is eaten, not to satisfy, but to deaden hunger. During the siege, but before the last extremities, a pound of horse-flesh is sold for 32 cents [1s. 4d.]; a pound of bran for 30 cents [1s. 3d.]; a pound of flour, 1 dollar 75 cents [about 6s. 6d.]. A single bean is soon sold for four cents [2d.]; and a biscuit of three ounces for 2 dollars 25 cents [about 10s. 6d.]; and finally none are to be had. The miserable soldiers, after devouring all the horses in the city, are reduced to the degradation of feeding on dogs, cats, rats, and worms, which are eagerly hunted out in the cellars and common sewers. Happy were now, exclaims an Italian historian, not those who lived, but those who died! The day is dreary from hunger; the night more dreary still, from hunger accompanied by delirious fancies. Recourse is now had to herbs—monk's rhubarb, sorrel, mallows, wild succory. People of every condition, women of noble birth and beauty, seek on the slope of the mountain, enclosed within the defences, those aliments which nature destined solely for the beasts. A little cheese, and a few vegetables, are all that can be afforded to the sick and wounded—those sacred stipendiaries upon human charity. Men and women in the last anguish of despair, now fill the air with their groans and shrieks; some in spasms, convulsions, and contortions, gasping their last breath on the unpitying stones of the streets. Alas! not more unpitying than man. Children, whom a dying mother's arms had ceased to protect—the orphans of an hour—with piercing cries seek in vain the compassion of the passing stranger; but none pity or aid them. The sweet fountains of sympathy are all closed by the selfishness of individual distress. In the general agony, the more impetuous rush out of the gates, and impale themselves on the Austrian bayonets, while others precipitate themselves into the sea. Others still (pardon the dire recital!) are driven to eat their shoes, and devour the leather of their pouches; and the horror of human flesh has so far abated, that numbers feed, like cannibals, on the bodies of the dead. At this stage the French general capitulated, claiming and receiving what are called "the honours of war;" but not before twenty thousand innocent persons, old and young, women and children, having no part or interest in the war, had died the most horrible of deaths. The Austrian flag floated over the captured Genoa but a brief span of time; for Bonaparte had already descended, like an eagle, from the Alps, and in less than a fortnight afterwards, on the vast plains of Marengo, shattered, as with an iron mace, the Austrian empire in Italy.'

Our next extract will refer to a branch of the subject which may be said to lie at the basis of the whole question. We allude to a selfish or exaggerated love of country. Exclusive love for the land of our birth is

not less irrational than immoral. 'It has been a part of the policy of rulers to encourage this exclusive patriotism; and the people of modern times have each inherited the feeling of antiquity. I do not know that any one nation is in a condition to reproach the other with this patriotic selfishness. All are selfish. Among us, the sentiment has become active, while it has derived new force from the point with which it has been expressed. An officer of our navy, one of the so-called heroes nurtured by war, whose name has been praised in churches, has gone beyond all Greek, all Roman example. "Our country, *be she right or wrong!*" was his exclamation; a sentiment dethroning God, and enthroning the devil, whose flagitious character should be rebuked by every honest heart. "Our country, our whole country, and *nothing but our country!*" are other words, which have often been painted on banners, and echoed by the voices of innumerable multitudes. Cold and dreary, narrow and selfish, would be this life, if *nothing but our country* occupied our souls; if the thoughts that wander through eternity, if the infinite affections of our nature, were restrained to that spot of earth where we have been placed by the accident of birth.

'I do not inculcate an indifference to country. We incline, by a natural sentiment, to the spot where we were born, to the fields which witnessed the sports of childhood, to the seat of youthful studies, and to the institutions under which we have been trained. The finger of God writes, in indelible colours, all these things upon the heart of man; so that, in the dread extremities of death, he reverts in fondness to early associations, and longs for a draught of cold water from the bucket in his father's well. This sentiment is independent of reflection, for it begins before reflection, grows with our growth, and strengthens with our strength. It is blind in its nature, and it is the duty of each of us to take care that it does not absorb the whole character. In the moral night which has enveloped the world, each nation thus far has lived ignorant and careless, to much extent, of the interests of others, which it imperfectly saw; but this thick darkness has now been scattered, and we begin to discern, all gilded by the beams of morning, the distant mountain-peaks of other lands. We find that God has not placed us on this earth alone; that there are other nations, equally with us, children of his protecting care.

'Viewing, then, the different people on the globe as all deriving their blood from a common source, and separated only by the accident of mountains, rivers, and seas, into those distinctions around which cluster the associations of country, we must regard all the children of the earth as members of the great human family. Discord in this family is treason to God; while all war is nothing else than civil war. It will be in vain that we restrain this odious term, importing so much of horror, to the petty dissensions of a single state. The muse of history, in the faithful record of the future transactions of nations, inspired by a new and loftier justice, and touched to finer sensibilities, shall extend to the general sorrows of universal man the sympathy which has been profusely shed for the selfish sorrow of country, and shall pronounce *all war to be civil war, and the partakers in it as traitors to God and enemies to man.*'

Having employed various arguments to show the folly and crime of war, he observes that there is still one more consideration, yielding to none of the others in importance—that of the enormous cost of actual warfare, as well as of the preparations for war in time of peace. The summary which he presents on this head is exceedingly striking; but instructive as it is, we must necessarily give it in a condensed form; and, for the sake of clearness, shall turn his calculations by dollars into sterling money.

'According to the most recent tables, the public debt of the different European states amounts to *one billion three hundred and thirty millions six hundred and twenty-five thousand pounds*—all the growth of war. It is said that there are, throughout these states, seventeen millions nine hundred thousand paupers, or persons subsisting at the expense of the country, without contributing to its resources. If these millions of the public debt, forming only a part of what has been wasted in war, could be apportioned among these poor, it would give to each of them L.78, 2s. 6d.—a sum which would place all above want.'

Excessive as are the burdens imposed on European nations by war debts and current war expenditure, it appears that the proportion of outlay on war is much greater in the United States—a fact which will astonish a number of our readers. 'Let us observe the relative expenditures of the United States in the scale of the nations for military preparations in time of peace, exclusive of payments on account of the debts. These expenditures are in proportion to the whole expenditure of government: in Austria, as 33 per cent.; in France, as 38 per cent.; in Prussia, as 44 per cent.; in Great Britain, as 74 per cent.; in the United States, as 80 per cent.!

'By a table of the expenditures of the United States, exclusive of payments on account of the public debt, it appears that, in the fifty-three years from the formation of our present government in 1789 down to 1843, there has been spent the enormous sum of *seventeen hundred and thirty-five millions* of dollars (L.361,458,333)—a sum beyond the conception of human faculties—sunk, under the sanction of the government of the United States, in mere *peaceful preparations for war;* more than *seven times* as much as was dedicated by the government, during the same period, to all other purposes whatsoever!'

Mr Sumner seems to be very properly aware, that of such statements the mind fails to take any adequate grasp. The idea of hundreds of millions of money is apparently beyond ordinary comprehension; and to this fact is perhaps, in no small degree, owing the heedlessness as to war expenses. In order, therefore, to bring the matter more clearly before his auditors, the orator refers to the comparative cost of certain venerable and useful institutions, and that of a war-vessel lying at anchor in the harbour of Boston. He refers first to the Harvard university, the oldest institution of the kind in the states, 'the most important seat of learning in the land; possessing the oldest and most valuable library, one of the largest museums of mineralogy and natural history; a school of law, which annually receives into its bosom more than one hundred and fifty sons from all parts of the Union, where they listen to instruction from professors whose names have become among the most valuable possessions of the land; a school of divinity, the nurse of true learning and piety; one of the largest and most flourishing schools of medicine in the country: besides these, a general body of teachers, twenty-seven in number, many of whose names help to keep the name of the country respectable in every part of the globe where science, learning, and taste are cherished. It appears, from the last report of the treasurer, that the whole available property of the university—the various accumulations of more than two centuries of generosity—amounts to 703,175 dollars (L.152,354, 4s. 2d.). There now swings idly at her moorings, in this harbour, a ship of the line—the Ohio—carrying ninety guns, costing, with its armament, 834,845 dollars (L.180,049, 15s.); more than 100,000 dollars beyond all the available accumulations of the richest and most ancient seat of learning in the land.

'Let us pursue the comparison still further. The account of the expenditures of the university during the last year, for the general purposes of the college, the instruction of the under-graduates, and for the schools of law and divinity, amounts to 45,949 dollars (L.9535, 9s.). The cost of the Ohio for one year in service—in salaries, wages, and provisions—is 220,000 dollars (L.47,666, 13s.), being 175,000 dollars (L.38,131, 4s.) more than the annual expenditures of the university; more than *four times* as much. In other words, for the annual sum which is lavished on one ship of the line,

four institutions like Harvard university might be sustained throughout the country! Still further let us pursue the comparison. The pay of the captain of a ship like the Ohio is 4500 dollars (L.970) when in service, 3500 dollars (L.753, 6s. 8d.) when on leave of absence or off duty. The salary of the president of the Harvard university is 2205 dollars (L.477, 15s.), without leave of absence, and never being off duty.'

Passing over numerous arguments proving the unchristian character of war, we arrive at the orator's exposition of the remedy for this universal disease. 'In nearly every instance, war fails to secure the rights for which arms were taken up. Each party, as the war proceeds, becomes tired of the contest; and the affair generally ends by leaving the matter in dispute where it stood at the outset. Thus, the last war with the United States and Britain was utterly fruitless in any result but loss on both sides. It being impossible to obtain justice by war, what is the alternative? The various modes which have been proposed for the termination of disputes between nations, are negotiation, arbitration, mediation, and a congress of nations; all of them practicable, and calculated to secure peaceful justice. Let it not be said, then, that war is a necessity: and may our country aim at the true glory of taking the lead in the recognition of these, as the only proper modes of determining justice between nations!'

We heartily wish that Mr Sumner may be able to impress these considerations on the minds of his countrymen, who at the present moment seem little disposed to consign national disputes to just and peaceful arbitration.

FUNERAL-FANCYING DOG.

My attention was recently taken up by reading in *Chambers's Miscellany* a very interesting article, entitled 'Anecdotes of Dogs;' and the instances adduced by the writer of the personal attachment, fidelity, educability, sagacity, benevolence, and eccentricities of dogs, are highly amusing and surprising. I was particularly struck with an account given of a dog which, a few years ago, attended all the fires that occurred in London, as forming a very close resemblance to a dog which I knew, a few years ago, belonging to Mr Henderson, late post-master, Fort-William, which attended every funeral that took place in that village and neighbourhood. There was nothing remarkable in his appearance. He was a rough, thick-set, stout little animal—a cross between a cocker and a terrier. His master taught him nothing, nor seemed to take much notice of him. Gilliemor was his name, and a sulky, surly little fellow he was, as all the urchins who used to play about the post-office could testify; for he had a mortal hatred to their noise, as he had also to beggars, at whom he would bark and snap furiously. He did not seem to be particularly attached to any person, nor did he care much about being caressed; neither did he associate with other dogs. The only remarkable feature in his character was his predilection for attending funerals. Whenever a funeral happened, although it were ten miles distant, and although he had to cross ferries, rivers, and often arms of the sea, the moment the coffin appeared, Gilliemor appeared also, and never left its side until it reached the burying-ground. There he would look anxiously on while the body was being interred; and that melancholy duty over, he would immediately trot away home, or set off to attend some other funeral. He has been known to attend many funerals in different parts of the country in one day. When any person died near his master's residence, on the day of the funeral Gilliemor, as usual, employed himself in driving away the noisy children and beggars, till within a few minutes of the hour specified in the funeral letters, when he would shake himself, as if dressing, and trudge away to join in the mournful procession. This was so well known in the place, and people became so much accustomed to it, that it excited very little surprise; and scarcely any notice was taken of Gilliemor, unless among the ignorant and superstitious, who looked upon him as an indispensable chief mourner, and always wished the favour of his company to the place of interment.—*Correspondent of Courant.*

A GREEK ALLEGORY.

Deep in a forest lay the shepherd Mysius,
Where the thick boughs made twilight dim all day;
And the pressed hyacinths, in scent delicious,
Beside him breathed their frail pure lives away;
He, evermore, through the wood's stillness crying,
'Echo, sweet echo, listen to my sighing.'

'Echo, sweet echo, oft I hear low voices
Stirring the leaves and whispering in the grass,
And my sick heart leaps up in wild rejoices,
To think it may be thou who near dost pass;
I, who have heard thee once, must ever pine,
Until I look upon thy form divine.

Nymph, goddess, shade, whiche'er thou art, oh never
Will this mad longing from my spirit flee;
Nor seeking, will I shrink from the endeavour,
Until I clasp grim death itself—or thee!'
Death came; but never in the haunted shade
Did Mysius gaze upon the phantom-maid.

And many a young heart, in after ages,
Has formed, like him, some idol for its shrine—
Fame, poesy, or love—which all engages
Its powers, and with its every thought does twine;
A voice is heard, a shadow glads the eyes;
The soul's ideal ever onwards flies.

Yet life has treasures rich to give, love-worthy
And beautiful, oh foolish shepherd boy;
Hadst thou but seen the fair things that bloomed for thee,
The woods, the skies, the flowers all breathing joy,
Thou hadst not pined away in lone unrest,
But drank of nature's fulness, and been blest.

D. M. M.

CONTEMPLATION.

Contemplation is the peculiar attribute of man, who alone dives into the causes and effects of things. Without it, memory and observation are in great part useless; for we can profit but little by what we see and remember, unless we rightly think. It forms facts into systems, even as the architect erects with his materials, and reduces into harmony and order, the discordant and confused. It especially distinguishes great minds, and separates them from the herd of the superficial and the shallow. Because some men neglect it, they are passively moulded into any form which chance or fortune in its caprice may choose for them, and, like straws upon the stream, they are carried onwards by the current of opinion. Did you contemplate oftener, you would no longer complain that your studies are laborious in pursuit, but sterile in their consequences: you would glean more knowledge with less toil. The mind should view the subject it considers in all its phases, and should divide it into its elements, even as the prism acts upon the light. It should search for theories to explain details, and for details to illustrate and confirm theories. It should be perpetually on the wing—arranging, comparing, analysing, deducing. Do you know a man superior to all the rest of your acquaintance, be sure he is habituated to contemplation; it is this which has given such strength to his reason, such depth to his judgment.—*Self-Culture.*

HOW TO BE LOVED.

To be really loved, we should cultivate, by all our language and conduct, a certain reverence in others towards us; even in those between whom and ourselves familiarity has been longest established. At the same time we should take care to excite no apprehension, either by ill-natured exhibitions of wit (if we have it), or by displaying any species of power or superiority. Genuine attachment naturally allies itself with respectful deportment; and the most rooted dislike is the offspring of dread. To express all in a distich—

True love to win, live so that men revere you;
To gain their hatred, live to make them fear you.

—*Literary Florets*, 1846.

POETRY IN ALL THINGS.

It is easy to ring the changes upon a set of words, but unless our words express distinct ideas, we may as well exercise our ingenuity upon a peal of bells; in either case our sense of melody may be gratified, but we shall make small progress in the one great purpose of human intelligence—the development and application of truth. Let us then endeavour to understand clearly what we mean by 'poetry.'

Often as the question has been repeated, it does not as yet appear to have been answered satisfactorily. Indeed the replies are as various as the minds which have put them forth; and almost as vague as the celebrated conundrums of Delphos. But must we therefore suppose that poetry has no clear and definable character? Is it conceivable that a power which has in all ages exercised so mighty and so direct an influence upon men's minds, is in its own nature so vague, or so uncertain, that it cannot be brought within the grasp of human intelligence; or that its essential qualities cannot be expressed in the compass of a definition? Surely not. How then is it that, with so much wondrous and soul-thrilling poetry in the world, men should be so little agreed about what is essential to its nature? It is because poetry is the voice of the Infinite, and can accommodate itself to the capacities of all. Man's conception of Deity has ever been influenced by his ideal of perfection; and his feeling for poetry, whether consciously or not, must always be regulated by that which constitutes his ruling love. Whatever a man most loves, will be to him the poetry of his life. Thus men have judged of poetry from their own experience; and their opinions have been as various as their feelings have been different. But the attributes of Deity are not dependent upon the conceptions of man; and the essential nature of poetry is not based upon human imaginations. The highest poetry is a living reality—universal and immutable: it is coeval with creation; for it is the likeness of God, reflected in his works. The truest poet is not creative, as some have imagined; he merely sees and feels more deeply than others. He looks around upon the wonders of the universe; he penetrates the recesses of the human heart; and every good thing speaks to him of a wondrous Intelligence and an exhaustless Love. The true poet has been not inaptly described as one who is ever striving after the pure and perfect; and what can be purer than Infinite Love, or what more perfect than Infinite Wisdom? This is the 'divine idea' of all true philosophy: God in all things; not as a vague abstraction, but as the creator and upholder of the universe.

This high order of poetry, hitherto, has been but feebly developed. We have caught a glimpse of the eternal truth; but we have yet to learn its practical value. There is, however, another order of poetry, which has yielded a more abundant harvest. Less divine in its character, and perhaps more evident in its significance, it has been better suited to that lower condition of humanity from which we are gradually progressing. Instead of seeing in every object of creation an infinite intelligence and a boundless love, poets have been content to trace throughout nature merely human attributes and utterances. And this, although not the highest that nature is capable of revealing, is nevertheless real truthful poetry. Thus men have felt their joys and sorrows, their struggles and their triumphs, shared or reflected by the living or senseless objects by which they are surrounded. Instead of nature being a mere convenience, by which they are to supply their material wants, she is felt to be a living companion, sympathising with every emotion, and speaking in tones that can touch the heart, or animate the soul to exertion. This consociating with nature is more or less the characteristic of all poets; and he has been indeed a true poet who has made men feel that the whole created universe is knit together in one eternal bond of harmony and companionship.

Perhaps of all men, Shakspeare and Burns have been in this respect the most successful; not because they have *asserted* this relationship more definitely than any others—this may be, and often has been done, with small aid from poetry—but because they have actually *manifested* this universal sympathy, as the experience of their own hearts. In this point of view, it would be difficult to establish the poetic superiority of either one over the other. This assertion may appear rash to some, even of Burns's most ardent admirers; while to the true believers in the divinity of England's bard, it may seem little short of poetic heresy: nevertheless, it is not made without due consideration, as we will presently endeavour to show. Notwithstanding the admitted disparity between the wide-surveying intellect, the human omniscience of the great dramatist, and the more limited, yet not less clear-sighted vision of the humble minstrel, in poetic genius they are twin brothers. Though the one is to the other as the sweet and simple lute to the full band of instrumental harmony, yet is it the same universal melody, the same heartfelt strain, that finds utterance in each. Although, in intellectual capacity, they are as distinct and wide asunder as the lowly hawthorn and the giant oak, in poetic endowment they are identical. The question involved in this statement, is not whether they have given to the world an equal amount of genuine poetry, but rather whether we can find examples of truer poetry in the one than may be found in the other? In order to determine this with any degree of clearness, it will be necessary to understand what it is that constitutes them poets.

We have already said that a poet is essentially one

who sees and feels more deeply than others. Let us endeavour to explain this more fully. To be a poet, a man must not rest contented with conventionalities and outward shows; with mere arbitrary distinctions of right and wrong, however specious they may appear: he must have that directness and clearness of vision which can at once discriminate between the essential and the accidental; between that which exists in the very nature of things, and that which is merely of artificial growth. An intellectual discrimination, however, is not all that is required. A man may be very acute in detecting fallacies, and even in discerning truth, and yet have but a small claim to the character of a poet. To be a poet, he must not only see beneath the surface of things, but he must feel as deeply as he sees: he must not only see that a thing is true, but he must also feel that it is true; else whatever it may be in itself, or to others, it can be no poetry to him. Let a man possess these two requisites, and if he is but true to himself, if he will but give scope to his own nature, and not fritter away his life and talents by striving to cramp them into some artificial mould prescribed by custom, he will be a poet in the truest sense; if he does not write poetry, he yet cannot fail in that which is often better, for his life will be a real poem, doubtless sadly chequered in its course, but ever eloquent in its significance; ever earnestly striving after the real and immutable. To the mere conventionalist, such a life may often seem a vain, perhaps even impious struggle. But why should he venture to rebuke that which he cannot comprehend? Shall the barn-door fowl measure the flight of the eagle? Shall the pert sparrow prescribe limits to the wing or the warbling of the lark?

To the mere prose-thinking mind, a beautiful tree is a certain well-contrived ornament, or perhaps a very useful and ornamental production, showing a perfect skill in the adaptation of means to a given end. But to the poet it is all this, and far more than this: it is a living companion. That unconscious tree has for him a thousand sympathies, ever speaking to his heart. Will it be said that this is all 'imagination,' a beautiful fiction? that poetry is but a comely garment, hiding, rather than revealing, the truth of nature? Away with the godless thought! Are we then to believe that creation is but a dumb show, a mere mechanical contrivance, and that all the beautiful and soul-thrilling poetry that has so often kindled and delighted the world is really an invention of man's? Do we generally find more to admire, more to awaken our sympathies with truth, in proportion as we depart from nature, or as we unfold her hidden loveliness? Truly the greatest poet is he who sees the deepest beneath the surface of things, and who feels the truth of what he thus discovers. No one who really feels the beauty of a poetic thought, but must also feel that it would degenerate to a mere elegant conceit, if it did not convey some truth to his mind. And it may be well here to remark that we cannot, in any strict sense of the term, be said to 'invent' that which is solely a development, or an application of truth: we may invent errors, or fallacies, but we cannot invent what is true. Truth is essentially *that which exists;* and proximately, the laws by which things exist, or are related to each other. It must be clear, then, that the most we can do is to discover truth, and apply it. To discern it, to see its various applications, is simply an intellectual operation; but it requires a deeper and more vital principle to develop it in its power, or in anyway to make it our own; to do this, it must be felt, it must be conjoined with our very life: and this is the source of all poetry, whether developed in action or in words.

The quality of any given poetry (or the nature and application of the truths thus developed) must, then, evidently depend upon the quality of the heart from which it sprung; whether it be the awful and selfish daring of a Lady Macbeth, or the sweet simplicity and generous affection of an Imogen. Thus even selfishness may be manifested poetically; and although it can never be genuine, rightful poetry, inasmuch as it is based upon a perversion of truth, yet is it the only poetry that the utterly selfish could appreciate. All truth, however, being essentially of divine origin, to be truly and rightly felt, must appeal to, and be recognised by, the diviner principles of our nature. Now, the feelings by which we may be brought into the closest communion with the divine, are evidently reverence and love. Truth, then, to be vitally received, must appeal to at least one of these sympathies; and to do so, it must be felt to be either beautiful or sublime. That which we can cling to with a deep and exhaustless love, we instinctively regard as beautiful; while that which we revere, and which fills the mind with a feeling of immensity and of power, we speak of as sublime. Beauty is the innate loveliness of truth; sublimity its immeasurable grandeur, its immutable strength. There is, however, a factitious beauty and sublimity, as well as a genuine. To the selfish, that will ever be felt as beautiful which harmonises with his self-love; and that will be felt as sublime which overawes him by an appearance of resistless strength.

Poetry, then, may be defined to be truth inspired by feeling, and breathed into forms of beauty or sublimity. This definition seems to express the essential characteristics of poetry, in all its manifestations; whether the inspired thought be developed in painting, in sculpture, in architecture, in music, in language, or in action: they all range themselves under the same formula; for they are but various modes of expressing the same divine principle. Of this we shall speak more fully hereafter. Let us now apply the foregoing observations to the elucidation of the supposed identity of poetic genius in Shakspeare and Burns.

If the view here taken of poetry be correct, the question for us to consider is—what was the nature and depth of their poetic insight? It evidently consisted in a clear and intuitive perception of the social relations of man. They are pre-eminently the poets of social life. The most obvious and superficial view that we can take of the great family of mankind, is that which embraces only their conventional, and merely arbitrary relations; and this is the standard by which men are usually judged. Society has ever had its own special standard of morals, of rank, of human worth; the same being an embodiment of the changing spirit of the times. But besides this fluctuating and partial standard, there is another, founded on the intrinsic nature of man, which is universal and eternal, and thus applicable to every form and condition of society. It is only by this latter standard that we can appreciate the true worth of any given character or custom; and it is this power that especially belongs to Shakspeare and Burns. They saw mankind not merely as they were connected by the customs and regulations of society, but in their actual relation one to another. They saw not merely the arbitrary relation of outward rank, but also the sterling value, and genuine relation of heart and of intellect. This is what they developed more clearly than others; and this they saw with equal distinctness, and

felt with equal power. This appears to be the first definite advance in genuine poetry: it raises man above mere sensual enjoyment, to the higher poetry of social life: it does not reveal the deeper mysteries of our being; it does not show the great purpose of life as consisting in conquering self, and striving after conjunction with the All-perfect. This is the highest of human poetry; and it has yet to find a poet to give it utterance. Alas! how much easier is it to see the want, than to supply it!

It is an old remark, that the most astonishing characteristic of Shakspeare's writings is not the depth or the intensity of the poetry which they contain, but the comprehensive, all-surveying intellect which they manifest. It is necessary to keep this in view in forming an estimate of their actual value, for in this respect they are altogether without parallel. This comprehensiveness of intellect is, however, essentially distinct from the poetic power; indeed it may exist in connexion with the veriest prose; but it is not, on that account, of little value even to the poet; it affords the mind a wider range of thought, although it does not enable it to penetrate deeper into the mystery of existence. We can imagine that Shakspeare's capacious intellect would have been equally well adapted to the production of a set treatise on the various workings of the human mind; he could doubtless have been as unparalleled in the character of a prose philosopher, as he is now in that of a dramatist. In this respect the genius of Burns is far more limited. He has the same poetic insight, but not the same intellectual capacity. They are equally remarkable for the sterling truths which they educe from their subject—truths which strike home to the heart; but they are widely different in their treatment of the subject itself. Shakspeare sketches a complete character, while Burns gives only a few, or but one of its phases. Yet they both penetrate to the heart of the subject; they both develop the same poetry of social life. In short, the one is a dramatist, the other a minstrel.

There is the same coincidence, and the same difference, in their mirth. Their very laughter has poetry in it; for it is instinct with truth, and it comes directly from the heart. The mirth of Shakspeare is not more genial or more truthful than that of Burns; but it is broader and more varied—in one word, more comprehensive. The laughter of the one beams from the whole visage, the laughter of the other may be best seen sparkling in the eye. The one delights in broad jests and many-sided wit, the other in quaint simplicity and sly humour; but the mirth of both is equally suggestive of glowing thoughts, of social poetry.

With Shakspeare, poetic insight forms but one element of his wondrous mind; with Burns, it is that which has rendered him remarkable; he is essentially and almost solely a poet. He does not present a comprehensive view of the details of his subject; but he seizes at once upon that which gives it vitality, which imparts to it a living and eternal interest. Witness his 'Bannockburn.' Shakspeare has nothing that surpasses it. Even Coriolanus, as a poetic conception, can only rank by its side. And why is this? Simply because he has spoken the very truth of the matter in tones coming from the heart. Many have confessed their inability to discover the poetry of this glorious ode. Alas! they looked for 'figures of speech,' personifications, comparisons, and other technical abstractions, deeming these, however cold and truthless, the essentials of poetry. These, indeed, may 'seem,' like Hamlet's 'customary suits of solemn black;' they are, however, but the 'trappings' of that within which too often passeth show.

Shakspeare and Burns, we repeat, are pre-eminently the poets of social life. No wonder, then, that their poetry should be welcomed and appreciated wherever the human heart beats in sympathy and affection; no wonder that their memories should be loved and associated with the most hallowed of our household gods. But while we freely and gratefully accord all honour to these—the brightest stars in the social firmament—we must not forget that there is a higher poetry than even they disclose to our hearts. The further development of this higher order of poetry, however, will probably form the subject of a future paper.

THE TWO MOTTOS.

Two young men were standing in the booking-office of the Cernay diligences, having taken places in one that was about to start for Kaysersberg. They were apparently of the same age—perhaps four-and-twenty; but there was a striking difference in their persons, and in the expression of their countenances. The shorter of the two was slightly made, pale, and dark, betraying his southern origin at a glance, by his quick movements and impatient gestures. His companion, tall, fair, and blooming, was a good specimen of that mixed race of Alsace, in which the vivacity of the French is tempered by the equanimity and good-humour of the Germans. At their feet were two small portmanteaus, to which the addresses were affixed by sealing-wax. On one might be read, Henri Fortin of Marseilles; and on the seals were the words 'My right.' On the other was written, Joseph Mulzen of Strasburg; and the motto on the seals was 'Charity.'

The clerk had inscribed their names on his list, and was adding the quantity of luggage belonging to each, when Henri asked to have it weighed. The man replied that it would be done at Kaysersberg; but the Marseillais objected, alleging the inconvenience of such a formality amid all the bustle of arriving, and insisted upon its being done at once, saying he had a right to require it. The office-keeper, with equal obstinacy, refused to comply, and a warm and angry discussion ensued. Joseph tried to put an end to it by observing that they had barely time to dine before the diligence started; but Henri, who prided himself upon acting up to his motto, never would yield when he thought himself in the right; and unfortunately he seldom thought otherwise. At length the man, tired of the debate, quitted the office, and as his assistant spoke nothing but German, Henri decided upon following his cousin, on whom he vented his ill-humour.

'You would make a saint swear at your indifference,' cried he as soon as they were alone. 'Not even to support me against that obstinate fellow.'

'I thought he needed support more than you,' said Joseph laughing; 'for you piled up arguments against him, as though your fortune or your honour depended on the result.'

'Then you think it would be better not to assert one's rights?'

'When those rights are not worth asserting.'

'That is like you,' interrupted Henri with warmth; 'you are always ready to give up to every one: you would be trampled on before you would dream of defending yourself. Instead of looking upon the world as a field of battle, you seem to consider it as a drawing-room, where civilities are exchanged.'

'Not so,' said Joseph; 'but as a ship full of passengers, who ought to show mutual kindness and forbearance. Every man is my friend until he declares himself my enemy.'

'And I think every man my enemy until he has declared himself my friend. I have always found this sort of prudence the most successful; and I would advise you to adopt the same when we arrive at Kaysersberg. We shall meet there with the other heirs to our uncle's fortune, and depend upon it they will do all in their power to secure the best share; for my part I am resolved not to make the slightest concession.'

The young travellers had now reached the inn where they intended dining. On entering, they found the public room empty; but at the farther end was a table laid for three persons. Henri desired the landlady to bring plates for Joseph and himself.

'Excuse me, sir,' said the woman; 'but you cannot be served here.'

'Why not?' asked the young man.

'Because the persons for whom the table is laid have requested to dine alone.'

'Then let them stay in their own room,' returned Henri sharply; 'this is the public room and the public table, and surely every traveller has an equal right to enter and to be served here?

'What does it signify whether we dine here or in another room?' asked Joseph.

'And what is it to those persons if we choose to remain here?'

'They came before you, sir,' remonstrated the landlady.

'Then it is the first come who give the law in your house?'

'They are known to us besides.

'Their money is not better than ours, is it?'

'It is our interest to oblige our customers.'

'And all other travellers must obey their caprices?'

'You can be waited on in another apartment.

'With the remnants from the table of your privileged guests, I suppose?'

The landlady seemed hurt, and said, 'If monsieur thinks he cannot have a good dinner at the White Horse, there are other inns in Cernay.'

'Very true,' replied Henri, taking his hat and walking out, regardless of his cousin's attempts to detain him.

Mulzen knew by experience that the best way to act with his cousin was to leave him to himself until the fit was over, for every attempt at reasoning only added fuel to the fire. He decided, therefore, upon remaining where he was, and requested to have dinner served immediately in another room. He was about to go thither, when the persons who were expected made their appearance; they were an old lady with her niece, and an elderly gentleman, who seemed to be their protector. The landlady was giving them an account of what had passed, but perceiving Joseph, she left off abruptly. The latter bowed, and was leaving the room, when the old gentleman stopped him.

'I am very sorry,' said he in a friendly tone, 'for the dispute that has taken place. We had requested to dine alone, to avoid the company of certain individuals whose free manners and conversation might be disagreeable to these ladies, but not to drive other travellers away, as your friend seems to have supposed; and as a proof of it, I hope you will oblige me by sitting down to table with us?'

Joseph thanked him, and endeavoured to excuse himself, saying, that far from feeling offended at their desire to be alone, he thought it a very natural and proper precaution; but M. Rosman, which was the name given by the ladies to their protector, insisted in so frank and good-humoured a manner, that Joseph thought it best to comply. The old lady, who seemed little used to travelling, sat down opposite to him with her niece, and gave utterance to a deep groan.

'Are you very tired, Charlotte?' asked M. Rosman.

'Am I tired!' repeated the old woman; 'is that a question, after being shaken all day in that swinging diligence, eating out of my regular hours, running all manner of risks; for I am sure it is a wonder we were not upset fifty times; the diligence was always leaning to one side. I would give a good year of my life for this journey to be at an end.'

'Happily for us, dear aunt, you cannot make such a bargain,' said the young lady, smiling affectionately at her.

'Yes, yes, you may laugh,' returned Madame Charlotte, trying to look displeased; 'young girls are afraid of nothing now-a-days! They travel by railway, by steamboat—they would go by balloon if they could! It is the Revolution that has made them so bold. Before the Revolution, the most courageous were content to travel in a cart or on a donkey—and then not unless it was absolutely necessary. I have often heard my dear departed mother say that she had never travelled otherwise than on foot.'

'But then she never went farther than the chief town of the department,' observed M. Rosman.

'She was not the less a worthy and a happy woman,' replied Madame Charlotte: 'when a bird has built its nest, it remains in it. The present fashion of being always on the move, diminishes the love of fireside enjoyments: people get so used to be away from their homes, that they cease to care for them, and find a home everywhere. It may be more advantageous to society, but it makes individuals less happy and contented.'

'Come, come, Charlotte—you have quite a spite against travelling, because of the jolts,' said M. Rosman smiling. 'I hope this soup will dispel some of your prejudices; it could not be better even at Fontaines. I appeal to your impartiality.'

The conversation was continued in the same unembarrassed and cheerful manner; and Mulzen, who at first had discreetly kept silent, soon felt quite at home. M. Rosman frequently addressed himself to him; and they were talking like old friends, when it was announced that the diligence would start in a few minutes. They quickly settled with the landlady, and hastened to the office.

As Joseph arrived, he saw his cousin hurrying towards the same place. Whilst he had partaken of an excellent dinner, Henri had been running from one inn to another, without finding anything prepared; and as the time was gone, he had been forced to purchase a small loaf and some fruit to appease his hunger. This anchorite's repast had by no means improved his temper; which Joseph perceiving, forbore to make any remark; nor had he time, for the other passengers had already taken their places. As the cousins were preparing to follow, they were stopped by the office-keeper, who said he had made a mistake in booking them, for the diligence was already full.

'Full!' cried Henri; 'but you have taken our fare?'

'I am going to return it to you, sir.'

'Not at all!' said the Marseillais; 'when you took my money, you engaged to convey me to Kaysersberg. I have a right to go, and go I will.' And thus saying, he took hold of the leathern strap, and mounting to the top of the diligence, took possession of the only seat that was not yet occupied. The person to whom it belonged requested him to give it up; but Henri refused decidedly, saying that no one had a right to make him come down, and that if force were attempted, he also would use force. In vain did Joseph remonstrate, and urge him to give up the contested place—the contradiction he had met with, added to his frugal meal, had completely soured him, and he persisted in his refusal.

'Let each have his right!' cried he; 'that is my motto—yours is charity. Be as charitable as you like; for my part I only pretend to be just. I have paid for this place; I have a right to it; and I mean to keep it.'

The dispossessed traveller urged priority of possession; but Henri, who was a lawyer, answered him with scraps of law; and thus they continued exchanging angry explanations, recriminations, and menaces. Madame Charlotte, who heard all from the coupée, groaned audibly, and began to exclaim against travelling in general, and public conveyances in particular. At length Joseph, seeing the disputants becoming more violent, proposed to the office-keeper to hire a cabriolet, in which he and the ejected traveller might follow the diligence. The expedient was adopted, and they all set off.

It was November: the air, already cold and damp when they quitted Cernay, became freezing at the approach of night. In vain Henri, accustomed to the sun of Provence, buttoned his coat up to his chin: he trembled from head to foot in the chilling night fog. His face became almost blue; his teeth chattered; and, to add to his discomfort, a small drizzling rain began to

beat in his face, and soon penetrated his garments. His next neighbour, who was well sheltered under an ample and warmly-lined cloak, might have given him a share of it, without inconvenience to himself; but he was a stout elderly shopkeeper, very careful of himself, and very indifferent about others. When Henri had taken such forcible possession of another's place, he applauded him, saying that each travelled for himself. The young man then thought his maxim perfectly just—now he had a practical illustration of it. Once during the journey his corpulent companion turned to look at him, and observing his miserable condition, said, 'You look as if you were cold, sir?'

'I am wet to the very bones,' replied Henri, scarcely able to speak.

The shopkeeper drew his warm cloak more tightly round him, as if he enjoyed it the more from the contrast, and remarked philosophically, 'It is very injurious to get wet: when you travel again, I would advise you to get a cloak like mine; it is warm, and not dear;' and having delivered himself of this sage advice, he again buried his chin in the warm folds of his cravat, and resumed his comfortable doze.

It had long been dark when they arrived at Kaysersberg. Henri, half dead with cold, hastened to the kitchen of the inn, where a fire was blazing brightly. Among the travellers who surrounded it he perceived Joseph Mulzen and the stranger whose place he had taken: the cabriolet had brought them a nearer way across the country, and they had arrived full an hour before the diligence. Joseph, seeing the state his cousin was in, gave him his place near the fire; but as for his companion, he could not refrain from laughing heartily. 'Upon my word,' said he, 'I ought to be very much obliged to the gentleman. Without his usurpation, I should have been frozen like him, instead of being here warm and comfortable.' The Marseillais, too much out of temper to make any reply, sat down and warmed himself as well as he was able. As soon as he had in some measure recovered himself, he asked for a room and a bed; but there had been a fair at Kaysersberg, and the inn was full of persons, who intended leaving the town the following day. Joseph and his companion, although they had arrived earlier, had only found one very indifferent bed, which the former, with his usual good-nature, had given up to the stranger. After a great deal of bustling and searching, however, it was found that there was still one bed disengaged; but it was in a room already occupied by four pedlars, who declared they would not admit any one else.

'Have they engaged the room for themselves alone?' asked Henri.

'No,' said the innkeeper; 'each pays for his bed.'

'Then what reason do they give for refusing to admit another?'

'None at all; but as they seem to be quarrelsome fellows, no one wishes to interfere with them.'

'For my part,' said Henri, 'I shall not sit here all night because those insolent fellows choose to monopolise more beds than they can use. Show me to their room, and let them oppose me if they dare.'

'Take care, Henri,' said Mulzen; 'they are low, vicious men, and will probably insult you.'

'And is it because of their vices that I must lose my rest?' he asked angrily. 'Not I, faith! I shall go to bed in defiance of them.' And taking his travelling-cap, he was leaving the room, when M. Rosman, who had come to look after his luggage, and had heard the words exchanged between the cousins, accosted them in his usual pleasant and friendly manner.

'You are at a loss for beds, I perceive, gentlemen?' he said.

'I shall not be so long,' replied Henri, going towards the door.

'Stop a moment,' said M. Rosman; 'those men may handle you more roughly than you would like. You will find it difficult to convince them that you have an equal right with them. If you will accept a bed at my house, it is at your service. I reside only a few doors from here, and shall feel pleasure in accommodating you.'

The young men bowed, and thanked him; but there was a marked difference in their manner of doing so. Joseph looked pleased and grateful; whilst Henri, who had not forgotten that M. Rosman was the cause of his having lost his dinner at Cernay, was constrained, though polite.

'You are very obliging, sir,' said he, softening his tone; 'but I should be sorry to put you to any inconvenience; besides, I think it will not be amiss to give those fellows a lesson, and teach them to respect the rights of other travellers.' And bidding them good-night, he left the room.

Joseph, fearing the consequences, followed his cousin; but whether they were drowsy, or that the resolute air of the Marsellais deterred them, the pedlars only muttered a little; and Henri took undisturbed possession of his bed. Seeing there was nothing to fear, Joseph returned to the kitchen, where M. Rosman was waiting for him.

On reaching the house of the latter, they found Madame Charlotte and Louise preparing tea before a bright fire of pine cones. M. Rosman said a few words in a whisper to the ladies, who received Joseph with courtesy, and made him sit down to table with them. Louise poured out the tea, and Madame Charlotte, seating herself in her easy-chair, complained that she still felt the motion of the diligence, and that the bubbling of the kettle reminded her of the noise of the wheels. She asked Joseph what had become of the young man who had taken an outside place by assault; and M. Rosman answered by relating what had passed at the inn.

'He seems determined to have wars and contestations wherever he goes,' observed the old lady; 'if he continue, he will be feared by everybody.'

'A better heart than his could scarcely be met with, said Joseph; 'but, unfortunately, he is determined to act up to his favourite motto—"Let each have his right."'

'Whilst yours is—Charity,' said the old woman smiling; 'we heard it all at Cernay.'

'Do you travel together?' asked M. Rosman.

'We are cousins,' replied Joseph, 'and have come to Kaysersberg to be present at the opening of a will, which takes place to-morrow morning.'

'A will?' repeated Madame Charlotte in surprise.

'That of our late uncle, Dr Harver.'

The two ladies and M. Rosman exchanged looks.

'So you are the doctor's relatives?' said the latter; 'well, chance could not have directed you better. I have long been your uncle's most intimate friend.'

This species of recognition served as an introduction to speak of the departed. Mulzen had never seen his uncle, but he had felt for him that respectful affection that nature seldom fails to establish between distant members of the same family. He listened with deep interest and emotion to the details of his life, and the particulars of his last moments; and after one of those long, unreserved conversations, from which all restraint is banished, and in which hearts are laid open without disguise, Joseph retired to his chamber, delighted with his new friends, who on their part were equally pleased with the young man.

It was late when he rose the next morning, the fatigue of the previous day having made him oversleep himself. He dressed in haste, intending to call on his cousin, that they might go together to their uncle's lawyer; but on descending to the parlour, he found the latter there, together with Henri, who had been sent for, and M. Rosman. Madame Charlotte and Louise soon joined them; and when all were assembled, M. Rosman, addressing himself to the young men, said—'No one here is ignorant of what brings you to Kaysersberg, gentlemen; for my sister-in-law, Madame Charlotte Revel, and her niece, Louise Armand, whose guardian I am, are also come to be present at the opening of the will of their brother and uncle, Dr Harver.'

The young men bowed to Madame Charlotte and Louise, who returned their salute.

'I thought,' continued M. Rosman, 'that as chance had brought hither the parties interested, the doctor's last directions might be read at my house.'

Henri bowed his assent: they all sat down; and the notary was about to break the seal, when he stopped and said—'This will is already of an old date, and during the few last months of Dr Harver's life, he frequently expressed his intention of destroying it, so as to leave to each of his heirs the share assigned them by law. I can only attribute his not having done so to the suddenness of his removal. I thought it my duty to declare this; and now I ask all the parties interested, who are here present, if they are willing, with one accord, to destroy this will, without knowing which of them is enriched or set aside by it?'

This unexpected proposal was followed by a pause. Mulzen was the first to break silence.

'For my part,' said he modestly, 'having no special claim to my uncle's regard, I cannot think it any sacrifice to accept of an equal share, and I willingly agree to the proposal.'

'As far as I am concerned,' said Madame Charlotte, 'I have not the slightest objection.'

'And I consent to it in my ward's name,' added M. Rosman.

'There remains only this gentleman, then,' said the notary, turning to Henri, who seemed somewhat embarrassed.

'Like my cousin,' said he, 'I have no reason to expect a decision in my favour, but on that very account I withhold my consent. Whatever may have been my uncle's intentions, his will should be regarded as sacred. To alter it would neither be just to the testator nor to the unknown legatee.'

'In that case let us say no more about it,' said the notary; 'unanimity could alone legitimise such a proceeding. Let each have his right, as the gentleman requires, and be so good as listen:'—

'Of the four individuals who have any claim to my fortune, I am only acquainted with two—my sister, Charlotte Revel, and my niece, Louise Armand; but as these two have long had but one interest and one heart, and in reality form but one person, there is only Louise Armand to inherit on that side. It was my first intention to leave all I possess to her; but of my two unknown nephews, one may be equally worthy of my regard: the difficulty is to distinguish between them.

'Not being able to do it myself, and knowing the tact and intelligence of my niece Louise, I leave it to her judgment, and declare my sole heir whichever of her cousins she chooses for her husband.'

A long pause followed the reading of this singular will. The young men seemed embarrassed, and Louise's eyes were fixed on the ground.

'The doctor has given my niece a difficult task,' said Madame Charlotte at length.

'Not so difficult as you imagine, my sister,' said M. Rosman smiling. 'I have long known the contents of Harver's will; and the inquiries I made in consequence, have satisfied me that, however she may choose, she has nothing to fear.'

'Then let the young lady decide,' said the notary laughing; 'since it is in all safety, it can only be a matter of inspiration.'

'You must decide for me, aunt,' said Louise in a low tone, hiding her face in Madame Charlotte's bosom.

'My dear child,' said the latter, 'it is very embarrassing. I really do not know——'

Pronouncing these words, with a look of uncertainty she glanced at Mulzen. Henri perceived it, and exclaimed, 'I see your choice is made, madame; and though I must regret it, I cannot but approve of it. Mademoiselle,' he added, taking Joseph's hand, and leading him to the young lady, 'your aunt has seen and judged aright: my cousin is more worthy than I.'

'What you say proves the contrary,' said Madame Charlotte with emotion; 'but we already knew M. Mulzen; and — you deserve that I should be candid with you.'

'Say on,' interrupted Henri.

'Well, then, his motto gives me confidence—yours makes me fear: he promises indulgence—and you justice. Alas! my dear sir, justice may suffice for the angels, but we poor mortals need charity.'

'Perhaps you are right, madame,' said Henri pensively; 'since yesterday, it seems as if everything had conspired to teach me this lesson. My determination to defend my rights has, in every instance, turned against me, whilst my cousin's generous behaviour has always been to his advantage. Yes, Joseph is right; his motto is better than mine, for it comes nearer to the divine precept. Christ did not say—Let each have his right; but "Love your neighbour as yourself."'

SIR RODERICK MURCHISON IN RUSSIA.

THIS distinguished geologist, knighted a few weeks ago by our queen, produced in 1840 a splendid book on the lowest rocks which contain memorials of life — the Silurian System. The field of observation in that case was a portion of the west of England. He has now laid claim to even brighter laurels, by presenting an equally important work on the geology of Russia in Europe. The summers of the years 1840–4 were devoted by Sir Roderick, in company with two continental gentlemen of kindred taste, to a geological exploration of that mighty region, where, owing to the comparative rarity of disturbances occasioned by mountain ranges, particular formations (seen in little stripes in England) are developed in tracts equal to the whole surface of our island. In this undertaking he met the cordial approbation and assistance of the czar, who naturally is glad to be informed of the mineral wealth which the crust of the earth contains within his dominions, and perhaps has a love of science besides—a taste which has not hitherto been found incompatible with despotism.

In this superb publication—which seems designed to show that the age of great books is not yet past—we have many details of journeyings and explorings; on the shores of the White Sea, along the banks of the Dwina, throughout the great Ural range, and in the southern provinces; in the steppes of the Kalmucks, and on the sea of Azof; next in Poland; and finally in Scandinavia. The labour appears to have been immense, the adventures often painful and perilous. Mines were dived into, forests and mountainous tracts penetrated, and hyperborean oceans defied—all for the sake of science alone; for the whole of the party were men who could live at home at ease if they chose. Such things are, we think, worthy of particular notice; for they show the gifts of fortune not enervating the possessor, but only enabling him to render the more important services to his fellow-creatures. Finally, he prepares an elaborate book, not only giving us a history of what he did and saw, but containing a vast number of plates, illustrating the additions which he has thus made to the store of human knowledge.

Before the appearance of this work, it was known that the deposits formerly described by Sir Roderick (the Silurian) are developed in America and other distant portions of the earth, containing kindred fossils, and thus showing that the seas of that epoch were everywhere inhabited by a similar set of tenants. Here he brings forward Russia and Scandinavia to attest the same fact. So it is with higher formations, amongst which he devotes particular attention to those connected with the lower New Red Sandstone—a group

so amply and so interestingly developed in the province of Permia, that he now raises it to a distinct place in the geological scale, under the name of the Permian System. This system lying unconformably upon the coal formation, we become aware that 'disturbances' took place just before its deposition. The fossils, nevertheless, experience no violent change. We only see here a continued decline in their numbers. Strange to say, however, the next higher strata—the Lias—though lying quite conformable to the Permian, exhibit shells which are held by geologists as new. 'This,' says our author, 'is an important fact, and we dwell upon it as a proof that the most marked distinctions between the fossils of succeeding formations cannot always be referred to violent physical revolutions of the surface, by which, as it has been supposed, one class of animals was annihilated anterior to the creation of another.'

Leaving scientific results, as scarcely suitable at any extent for our pages, we feel tempted to accompany the enterprising travellers on their journey to the Ural mountains, the great mineral region of Russia. First explored in the days of the Czar Peter, the produce of these mines now contributes to the most important branch of the industry of the empire. A marked contrast exists between the inhabitants of these districts and those of the agricultural portions of the country; the former being much more active and intelligent than the latter. During this part of their journey the travellers entered Asia, and obtained a 'peep' into the dreary wilds of Siberia. Everywhere they found the name and authority of the emperor secure them an hospitable reception, and the readiest means of transit.

A large portion of the Ural tract is covered 'with dense forests and impassable marshes—diversified solely by occasional stony peaks, lifting their heads through monotonous and silent woodlands, which would to this day have been peopled by a few wild Voguls only, had not the precious ores led the Russians to colonise and clear them. . . . In these districts all difficulties have, in truth, vanished before the perseverance and energy of the Russian miners, whose labours have thinned the forests, erected commodious and often splendid buildings, drained the marshes, filled the gorges with lakes (for water is their great mining power), and rendered the tracts around their zavods, or mines, the residence of a population more advanced in knowledge than any with which it was our lot to meet in the greater part of the Russian empire. Yet in no work of geography or statistics can the general reader acquire an adequate conception of the highly flourishing condition of these centres of industry, each more populous and thriving than many towns which are marked on maps in large letters; and though it is not our object on this occasion to enter into economical details, we cannot avoid stating that these establishments, both imperial and private, often contain many thousand industrious workmen, whose houses and essential comforts we have seldom seen surpassed in the manufacturing towns of Europe. The town of Zlatàust, or "gold-mouth," situated at the foot of Mount Taganai, an elevation which, from its form, the Bashkirs call the "tripod of the moon," has become the great imperial workshop of the chain. Under the direction of the able engineer and metallurgist General Anàsoff, this establishment, whether for the superiority of its blades of damasked steel, or its richly-embossed ornaments, may truly be called the Sheffield and Birmingham of Eastern Russia.'

From Ekaterineburg, the capital of the Ural, the party descended the river Issetz to Kaltchedansk in Siberia, with a view to the examination of the rocky strata on its shores. Every facility was offered by the local authorities for their advance: the inhabitants of the villages on the banks of the stream were forewarned to hold themselves in readiness to assist with canoes. 'Looking back from Ekaterineburg to the Ural, the traveller can scarcely recognise the chain he has passed, so imperceptible is the slope; the gay spires and towers of the town itself, 850 feet above the sea, seeming simply to rise out of a slightly-inclined woody region. We travelled rapidly in our "tarantasses"—the carriages of Eastern Russia, which have the body of a calèche on long elastic poles, that serve as springs—and joined the Issetz near the station of Laginof, forty-seven verstes from Ekaterineburg, and where the river becomes deep enough, even in dry weather, for the navigation of small boats. Here, taking to the canoes, we soon learned to how much trouble we had exposed a whole population in order to satisfy our geological inquiry. Flowing with some rapidity from the eastern slopes of the Ural, and through a thickly-peopled tract, well covered with grain, the inhabitants naturally avail themselves of this stream to grind their corn, damming it up to establish the necessary mill-races. At each village, therefore, often not more than a mile asunder, we were compelled to disembark and walk round the dam, whilst the boats were lifted over by numerous peasants, assembled at each station for the purpose.'

The descendants of Demidoff, the agent employed by Peter the Great to explore the mineral resources of the region, are still living at some of the mining establishments. At Neviansk they keep up a large and commodious house for the entertainment of all strangers, free of expense.

Nijny Tagilsk is described as 'the chief zavod of the Demidoff family. With a population of 22,000 souls, it is truly a well-ordered town, in which the comfortable dwellings of the workmen, the capacious hospitals for their relief, the schools for the education of youth, the elegance of the public buildings and houses of the chief managers, and, above all, the skill with which the machinery, forges, and works are conducted, would reflect the highest credit upon any European establishment.'

On all convenient occasions the travellers availed themselves of water conveyance, as the banks of the streams afforded the best sections of the strata through which they flowed. On arriving at the Screbrianka, they found to their disappointment that 'the river beneath the water-works was nearly dry. The imperial instructions, however, for the fulfilment of our wishes were not to be slighted; and by daybreak after the evening of our arrival at Serebriansk, the worthy director of the establishment, M. Moskvin, having let off a large body of water from the upper reservoirs or lakes, had in one night created a river for our use, on which a few canoes and a larger boat were already afloat and manned!

'In this little flotilla we descended the wild and uninhabited gorge, though not with facility. The body of water was insufficient for our larger boat, laden with provisions and baggage; and even in the smaller canoes, it was difficult to avoid the rocks; so that, after descending for some hours, one of them was upset, and the geologists were well drenched in the rapid stream. The large boat, often lifted through the rapids by our hardy and cheerful boatmen, was at length worn through by the rough treatment of the projecting rocks. When within two miles of the mouth of the river, we were compelled to abandon the flotilla, and endeavour to force our way by night along the edges of the wild, untrodden, and virgin forest on the banks of the Serebrianka, not reaching the warm and dry huts of the peasants at Ust-Serebriansk until two in the morning.'

In crossing the Ural by the Katchkanar, the party took a road which had not been used for many years; workmen were therefore sent in advance to prepare the way. 'The director of the mines of Chresto-vodsvisgensk, M. Graube, a most intelligent Saxon miner, made every arrangement for this expedition, consisting of twenty horsemen, and also accompanied us to the Katchkanar, and bivouacked with us for the night in an open shed ("balagan") constructed on the moment, and roofed in by our handy Russian attendants, having taken care to send forward, according to hospitable Uralian custom, a supply of food and beverage. . . . Lying in the balagan before-mentioned, with our feet towards a large fire, we may remark that scarcely could

the smoke defend us from the myriads of mosquitoes of these northern forests, which, in the height of the summer, overpower the strongest man, and render geological observation difficult even in such gauze masks as we wore. . . . In a few minutes the broken and jagged outline of the Katchkanar burst upon the sight under a fine bright sun, and amid the merry song of birds. The dull, wet, and marshy woodlands were now exchanged for sunshine, rocks, and gorgeous vegetation. At length, then, we had found out a true mountain in the Ural; and leaving our horses at the first buttress which rises above the forest, we ascended the impending crags. Accustomed as we have been to the wildest features of the western Highlands of Scotland and the Alps, we are unacquainted with any scene presenting a finer foreground of abruptly-broken rocks; and never, certainly, had we looked over so grand and solitary a trackless forest as that which lay around us, and from which some straggling distant peaks reared their solitary heads.'

The aspect of the southern Ural is described as far more cheerful than that of the northern regions. Vegetation is rich and abundant. 'Light-running waters have access to beauteous glades, which, peopled by picturesquely-clad Bashkirs, cheer the sight of the traveller, who contrasts them with the gloomy and unpeopled thickets of the north.'

From the peak of Sugomac 'the panoramic prospect is very striking. To the west is a vast rolling surface of mountains, made up of ridges separated from each other by dark depressions, and all, with the exception of the distant stony crest, or "Ural Tan," covered with the densest forest. On the east, Siberia lies absolutely at your feet, and minor inequalities of the surface being merged, looks like one vast plain. The lake and zavod of Kishtymsk, with rich meadows around them, are in the middle ground, and the distance is composed of a woody and partially-pastoral tract, inhabited by Bashkirs, in which, as we were informed, at least a hundred lakes exist, ninety of which belong to the proprietor of Kishtymsk.' A view is given of the dreary and boundless plains, which the travellers describe as one of their most striking 'peeps into Siberia.'

'We spent a night amid the peaks of Irendyk, in the tents of the Bashkir chief, Mohammed John, who was encamped here for the summer pastures of his herds of mares and flocks of sheep. . . . In his tent, where we slept upon fresh-chopped fir-leaves, we were refreshed with excellent tea, whilst surrounded by numerous black skins filled with kumiss, or mare's milk, and ornamented chests, from which one of his wives unpacked his best crockery. The small horses of the Bashkirs are unequal to heavy labour, and eight of them, sometimes nine, with four riders, were deemed essential to conduct our "tarantass" along this "*commerzi tract!*"* Our *attelage* measured forty-five feet from the leading-horse to the carriage—with such long cords do these wild people fasten on one little pair of horses before the other! The relays of horses, boys, and men, were usually stationed in the glade at some ferry or natural boundary upon our route.'

It is a remarkable fact, that the metallic deposits of the Ural follow generally a meridian line, a course, indeed, that is taken by the whole mountain range. Relics of the mammoth and rhinoceros have been found in great quantities in the superficial deposits of the mineral region. These fossilised bones were regarded with great veneration by the Bashkirs, who said to the earliest Russian miners—'Take from us our gold if you will, but for heaven's sake leave us the bones of our ancestors.' So abundant is the produce of gold from this region, that it threatens, at no distant day, to cause a general reduction in the value of the precious metals. The mines near Ekaterineburg have yielded, in ninety-six years, 52,000,000 of poods of ore, or 679 poods of gold. In eleven years the Peshanka mines yielded 10,000 Russian pounds* of the metal; while near Miask, where the richest deposits lie, the gold has been found in solid lumps, one of which, discovered in 1843, weighs about 78 English pounds. Gold, in smaller quantities, is also dug with the iron ore: the mines around Kishtymsk produce 250,000 poods of iron and 17 poods of gold annually. The chromate of iron, so extensively used in dye-works at Manchester, is supplied from the mines at the foot of the Ural: one establishment sends 20,000 poods to Moscow every year.

Though the volumes before us are barren of incidents of travel, we occasionally catch a hint of the difficulties attendant on locomotion in remote and wild regions. At one time, on the Cossack frontier, when the party had travelled far beyond the limits of civilisation, their escort consisted of Kirghis, armed with bows and arrows. Even here, at Troïsk, a town of 5000 inhabitants, they found an annual fair. 'Four to five hundred Bokharians, a few Persians, and not less than 20,000 Kirghis, are said to frequent it annually with their various goods.' These, principally silk and cotton, are sold to the amount of 3,000,000 of rubles. A great source of discomfort was experienced in the swarms of mosquitoes, which are said to have been more numerous than the drops of rain. 'They constitute the chief impediment to geological research during the hot summer months in all these high latitudes, and particularly where wood and water abound. The hardy natives are even compelled to work in cowls, like those of Capuchin friars, through which their eyes, nose, and mouth only are seen; and we were driven to the use of masks and veils.'

An attempt is made to account for the changes of surface which Russia has undergone, and which are going on at the present day: the gradual filling up of her inland seas—the drift of loose rocks and stones from the Baltic to the White Sea, a distance of 2000 miles—and the 'black earth,' which, possessed of the most fertile properties, overspreads so large a portion of the country. The limestone of the boundless steppes is supposed to be the relic of a great inland sea, now shrunk down to the narrow limits of the present Caspian. The mountains of the Hindoo Koosh and Chinese Tartary formed its boundary in one direction, while in the other it reached to the Ural chain. Researches in every part of the vast region favour the supposition, that here flowed a sea exceeding 'in size the present Mediterranean. No one, in truth, can have stood upon the promontories of the Volga and the Sarpa, and have observed their salient and re-entering angles, so like the worn coasts of the sea, nor have gazed, as we have done, over the vast expanse of lower steppe at his feet, covered with marine exuviæ, some of them identical with the forms now living in the Caspian, and others closely allied to them, without being convinced that there was a period—and at no very distant period of time in the history of the planet—when the waves of a former Caspian washed against these shores.'

Before the party returned, they mounted to the summit of one of the loftiest peaks of the mountain range—Uralskaya-Sopka—where, 2500 feet above the level of the sea, with one foot in Asia and the other in Europe, they sang 'God save the emperor!' They speak highly of 'the hearty hospitality and generous support of all classes of Russians;' and remark that, with regard to that distinctive trait of national Muscovite character—a will which admits of no obstacle—they are bound to record that their own impatient 'forward' was ever cheerfully responded to by the *mōjna*† of the natives. With this talismanic word, the Russian has indeed raised monuments on the Moskwa and the Neva that rival the grandest efforts of ancient and modern times.

Amidst such a people no real difficulty could be experienced. If a bridge were broken, it seemed rebuilt

* Commercial road.

* A Russian pound is 14 oz. 7 dr.

† Literally, 'it is possible'—equivalent to the sailors' 'Ay, ay, sir.'

by magic; though a river-bed was dry, the travellers beheld it converted, as if miraculously, into a navigable stream; was the water too shallow—then did the athletic peasants cheerfully lift the boats over rocks, enlivening their progress with a merry carol. Wet or dry, hot or cold, no murmur escaped these resolute men; and *môjna* was their only cry.

MRS KIRKLAND'S 'WESTERN CLEARINGS.'

Mrs Kirkland is the same lady who, a few years ago, under the name of Clavers, presented a lively, descriptive volume on the *far-west*, wherein, it appears, she is a settler. A new volume, called 'Western Clearings,' consisting of a series of brief tales and sketches, is another gathering from the same field. The perfect originality and freshness of life, as it exists in the back states, insures that almost any account of it should be worth listening to; but in the present case, we have it handled by one of the acuter class of female minds, one with much literary dexterity, and an unusually keen eye for the ludicrous, so that the 'Western Clearings' is really a very presentable treatise. The fêtes, dancing meetings, and other hospitalities of the clusters of half-civilised, yet not unkindly people of these wildernesses, are sketched with a particularly free and lively pencil.

There is one paper, to us most attractive, but hardly fit to make any impression in detached passages, on 'Idle People,' treating the backwoodsman form of that passion of us all to be busy with anything which is not *work*. Industrious application is in vogue there; but still there are people who like it not, and these are forced, in their saunterings, to do something which will at least appear as having some solid result in view. They fish, gather whortleberries or plums, or take to bee-hunting.

'Baiting for wild bees,' says our authoress, 'beguiles the busy shunner of work into many a wearisome tramp, many a night-watch, and many a lost day. This is a most fascinating chase, and sometimes excites the very spirit of gambling. The stake seems so small in comparison with the possible prize—and gamblers and honey-seekers think all possible things probable—that some, who are scarcely ever tempted from regular business by any other disguise of idleness, cannot withstand a bee-hunt. A man whose arms and axe are all-sufficient to insure a comfortable livelihood for himself and his family, is chopping, perhaps, in a thick wood, where the voices of the locust, the cricket, the grasshopper, and the wild bee, with their kindred, are the only sounds that reach his ear from sunrise till sunset. He feels lonely and listless; and as noon draws on, he ceases from his hot toil, and seating himself on the tree which has just fallen beneath his axe, he takes out his lunch of bread and butter, and, musing as he eats, thinks how hard his life is, and how much better it must be to have bread and butter without working for it. His eye wanders through the thick forest, and follows, with a feeling of envy, the winged inhabitants of the trees and flowers, till at length he notes among the singing throng some half-dozen of bees.

'The lunch is soon despatched; a honey-tree must be near; and the chopper spends the remainder of the daylight in endeavouring to discover it. But the cunning insects scent the human robber, and will not approach their home until nightfall. So our weary wight plods homeward, laying plans for their destruction.

'The next morning's sun, as he peeps above the horizon, finds the bee-hunter burning honey-comb and old honey near the scene of yesterday's inkling. Stealthily does he watch his line of bait, and cautiously does he wait until the first glutton that finds himself sated with the luscious feast sets off in a "bee-line"—"like arrow darting from the bow"—blind betrayer of his home, like the human inebriate. This is enough. The spoiler asks no more; and the first moonlight night sees the rich hoard transferred to his cottage, where it sometimes serves, almost unaided, as food for the whole family, until the last drop is consumed. One hundred and fifty pounds of honey are sometimes found in a single tree; and it must be owned the temptation is great; but the luxury is generally dearly purchased, if the whole cost and consequences be counted. To be content with what supplies the wants of the body for the present moment, is, after all, the characteristic rather of the brute than of the man; and a family accustomed to this view of life will grow more and more idle and thriftless, until poverty and filth, and even beggary, lose all their terrors. It is almost proverbial among farmers that bee-hunters are always behind-hand.'

Another paper, styled 'Ambuscades,' relates the efforts made by a village belle, Miss Celestina, or Teeny Pye, to entrap a dashing young hunter, yclept Tom Oliver. She was the niece and protegée of Mrs Purfle, a lady possessing a small competency; so the villagers were much cap-in-hand to her. Tom, however, was not to be caught. After many plans had failed, 'Mr Ashdod Cockles came amongst us in the character of an artist, having his wagon loaded with wax-figures, puppets, magic-lanterns, and all those temptations which the pockets of western people, lank as they are, always find irresistible—including a hand-organ of course.' Being a nephew of Mrs Purfle, he puts up at her house. 'Most exhilarating were the preparations. The village ball-room was to be the scene of the grand exhibition of Mr Cockles's glory, and the stairs which led to that honoured chamber were well worn during that day of ceaseless bustle and excitement. Not that the common eye was permitted to get even a glimpse of the mysteries within; for a thick curtain was suspended inside, so that the assistants could pass in and out a hundred times without one's getting a single peep. But the boys and idlers still thought they *should* see something; so there they stayed from morning till night, scarcely taking time to eat.

'But while all promised so fair for the multitude, what was the surprise and grief of Mr Ashdod Cockles to find that one of his wax-figures, nay, the one of all others that he could worst spare, had been completely crushed by the superincumbent weight of the hand-organ. The Sleeping Beauty! That *she* should have been lost! What is a wax-work without a Sleeping Beauty? Dire was the disappointment of Mr Cockles, and loud his lamentations (in private), and much did he try to make his factotum acknowledge that he had erred in the packing. Nick knew his business too well for that; but he nevertheless condescended to suggest a remedy; namely, that Mr Cockles should induce some pretty girl of the village to be dressed in the glittering drapery of the crushed nymph, and perform the part for that night only. This seemed the more feasible, that the figure was to be covered up in bed, and the performance would thus involve no fatigue. So it only remained to obtain the handsome face; and, touching this delicate point, Mr Cockles consulted Mrs Purfle.'

The lady communicated in a whisper her belief that Celestina would undertake the part, if properly requested. The reader will appreciate the value of the hint, when he knows that Miss Pye was thick and short, with the complexion of a stewed oyster, and a mouth so pursed up, that it seemed at first glance as if she must always have been fed through a quill. '"Ahem!" said Mr Ashdod Cockles, who was troubled with a cold—"ahem! yes, ma'am—but it would be asking quite too much of your niece. I think we had better——"

"Not at all, not at all!" insisted the lady; "Teeny is so obliging, she'll not think anything of it. I'll ask her at once."

"But," persisted Mr Cockles, fidgetting a good deal, "she is really quite too short for the character. A taller figure——"

"Oh, you forget she is to be conveyed under the quilt!

I'll manage all that," said the zealous diplomatist; "I'll dress her, and everything."

'And she left the room, and returned in a very short time with Miss Pye's unhesitating consent. So Mr Cockles could not but be very much obliged; and Mrs Purfle, in the highest spirits, sent Brim off at once to Mr Oliver's, to tell him he must be sure to come to the exhibition. "And, Brim," she added, "if you tell him a word about you know what, I'll skin ye!" A favourite figure of speech of Mrs Purfle's.

"What exhibition?" said Tom, who had but just returned from the woods.

"Oh, everything in the world!" said Brim, who was as much excited as anybody; "and Miss Teeny——" But here he thought of his skin, and no persuasions of Tom could extort another word on that point, though he was fluent on the main subject.

'The evening came at last, and the weather chanced to be pleasanter than it generally is on great occasions. The ball-room was elegantly fitted up, with suspended crosses of wood stuck with tallow candles—rather drippy, but you must keep out of their way—(I have seen gentlemen's coats completely iced with spermaceti, which, if more genteel, is also more destructive). Instead of glass-cases, a screen or medium of dark-coloured gauze was interposed between the eye and the wax-figures, in order to produce the requisite illusion. The puppets and the magic-lantern came first in order; and so great was the delight of the spectators, that it would seem that any after-show must have been an anti-climax; but the experienced Mr Cockles knew better. It was not until all this was done, that he ordered Nick to draw aside the baize which had veiled the grand attraction. Great clapping and rapping ensued, and it was some time before Mr Cockles could venture to begin; this being a part of the exhibition in which he expected to shine personally.

"This, ladies and gentlemen," he began at the upper end of the room, "this is the New Orleans beauty. She was engaged to be married to two gentlemen at once; and, to avoid the torments of jealousy, they settled it between 'em, and first shot her and then each other through the heart! And they're all buried in one tomb; and I should have had the tomb too, only it was rather heavy to carry." Everybody crowded to this interesting sight.

"This," continued the exhibiter in a high-toned and theatrical voice, waving at the same time a gilded wand, which excited much admiration—"is the celebrated Miss M'Crea and her murderers, from likenesses taken on the spot by an eye-witness."

'A shudder ran through the throng at this announcement, and the grinning Indians were closely scrutinised, and the fierceness and many evil qualities of their race commented on in an under-tone.

"Here is a revolutionary character, ladies and gentlemen," Mr Cockles went on, as his familiar edged him along on his wheel-chair; and he pointed to a stumpy old man in a blue coat faced with red, who brandished a wooden sword as high as the ceiling would allow. "This was one of my forefathers," observed the orator with no little swell; "my great-great-grandfather, or some such relation. He was a man by the name of Horatio Cockles, who cut away the bridge at Rome just as the British was coming across it. You've all heard of Rome I suppose?"

'A murmur of assent went round; and one man observed, "I was born and brought up within five *mile* of it, but I never heard tell o' that 'ere feller!"

"Ay—yes—maybe not," said Mr Cockles, quite undisturbed; "but do you understand history?"

'The objector was posed, and the orator proceeded.

"This is Lay Fyett; and this is Bonypart, with a man's head that he has just cut off with his sword. He used to do that whenever he got mad."

'A shudder, with various exclamations.

"But here," said Mr Cockles, drawing aside with a flourishing air a mysterious-looking curtain, which had excited a good deal of curiosity during the evening, "this here is the Sleeping Beauty. Her infant daughter got broke a-coming."

'And there lay a female figure, in whose well-rouged cheeks and dyed ringlets no one recognised the heiress of Mrs Purfle's worldly substance. Even the eyebrows, which nature had left white, were entirely altered by the experienced skill of the artist, who had felt himself at liberty to put them on where he thought they would look best, the original ones being invisible by candle-light. A very elegant cap, full-trimmed with artificial flowers, had been arranged by Mrs Purfle; and the sky-blue pillow fringed with gold, and the purple quilt which belonged to the character, made altogether a very magnificent affair; though Mr Ashdod Cockles had not thought it prudent to suspend more than a single candle within the chintz curtains and the gauze blind.

'Just as the concealing screen had been withdrawn, and while a buzz of admiration was still in circulation, Tom Oliver, who had been in no haste to obey Mrs Purfle's hint, made his way into the room. He took a momentary glance at the attractions which lined the walls, and then sought the object which now fixed the eager crowd. It took a good look to satisfy him; but with the help of Brim's hint, and certain potent recollections, the truth came upon him at once; and with a very audible "Pshaw!" he turned on his heel and made for the door. The string by which the Sleeping Beauty's candle was suspended passing along near the ceiling, caught Tom's cap in his hasty retreat, and ruin ensued. In an instant Miss Teeny's gay head-dress was all in a blaze, and one whole side of her curls was burnt off before the cruel flames could be smothered. Tom was among the most active in endeavouring to repair the mischief he had done, and then, much mortified, darted out of the room.' The story ends by Tom marrying another young lady.

In 1835 a fever of speculation took place in the far-west, land being the matter dealt in. Both the speculators, and the 'land-lookers' who helped them in the business of their purchases, were odious to the actual settlers, because, by thus buying up land, they threatened to maintain a wilderness round the clearings for years—a serious disadvantage to these already too-solitary men. So much being premised, and with the additional knowledge that the backwoodsmen are generally very hospitable, the reader will apprehend the humour of the following sketch. It was at the height of the fever that a respectable-looking middle-aged man, riding a jaded horse, and carrying with him blankets, valise, saddle-bags, and holsters, stopped in front of a rough log-house, and accosted its tall and meagre tenant.

'This individual and his dwelling resembled each other in an unusual degree. The house was of the roughest; its ribs scarcely half-filled in with clay; its "looped-and-windowed raggedness" rendered more conspicuous by the tattered cotton sheets which had long done duty as glass, and which now fluttered in every breeze; its roof of oak shingles, warped into every possible curve; and its stick chimney, so like its owner's hat, open at the top, and jammed in at the sides; all shadowed forth the contour and equipments of the exceedingly easy and self-satisfied person who leaned on the fence, and snapped his long cart-whip, while he gave such answers as suited him to the gentleman in the India-rubbers, taking especial care not to invite him to alight.

"Can you tell me, my friend——" civilly began Mr Willoughby.

"Oh! *friend!*" interrupted the settler; "who told you I was your friend? Friends is scuss in these parts."

"You have at least no reason to be otherwise," replied the traveller, who was blessed with a very patient temper, especially where there was no use in getting angry.

"I don't know that," was the reply. "What fetched you into these woods?"

"If I should say 'my horse,' the answer would perhaps be as civil as the question."

"Jist as you like," said the other, turning on his heel and walking off.

"I wished merely to ask you," resumed Mr Willoughby, stalking after the nonchalant son of the forest, "whether this is Mr Pepper's land?"

"How do you know it aint mine?"

"I'm not likely to know at present, it seems," said the traveller, whose patience was getting a little frayed. And taking out his memorandum-book, he ran over his minutes: "South half of north-west quarter of section fourteen—— Your name is Leander Pepper, is it not?"

"Where did you get so much news? You aint the sheriff, be ye?"

"Pop!" screamed a white-headed urchin from the house—"mam says supper's ready."

"So aint I," replied the papa; "I've got all my chores to do yet." And he busied himself at a log pig-sty on the opposite side of the road, half as large as the dwelling-house. Here he was soon surrounded by a squalling multitude, with whom he seemed to hold a regular conversation.

'Mr Willoughby looked at the western sun, which was not far above the dense wall of trees that shut in the small clearing; then at the heavy clouds which advanced from the north, threatening a stormy night; then at his watch; and then at his note-book; and after all, at his predicament—on the whole an unpleasant prospect. But at this moment a female face showed itself at the door. Our traveller's memory reverted at once to the testimony of Ledyard and Mungo Park; and he had also some floating and indistinct poetical recollections of woman's being useful when a man was in difficulties, though hard to please at other times. The result of these reminiscences, which occupied a precious second, was, that Mr Willoughby dismounted, fastened his horse to the fence, and advanced with a brave and determined air to throw himself upon female kindness and sympathy.

'He naturally looked at the lady as he approached the door; but she did not return the compliment. She looked at the pigs, and talked to the children; and Mr Willoughby had time to observe that she was the very duplicate of her husband—as tall, as bony, as ragged, and twice as cross-looking.

"Malvina Jane!" she exclaimed in no dulcet treble, "be done a-paddlin' in that 'ere water! If I come there, I'll——"

"You'd better look at Sophrony, I guess," was the reply.

"Why, what's she a-doin'?"

"Well, I guess if you look you'll see!" responded Miss Malvina coolly as she passed into the house, leaving at every step a full impression of her foot in the same black mud that covered her sister from head to foot.

'The latter was saluted with a hearty cuff as she emerged from the puddle; and it was just at the propitious moment when her shrill howl aroused the echoes, that Mr Willoughby, having reached the threshold, was obliged to set about making the agreeable to the mamma. And he called up for the occasion all his politeness.

"I believe I must become an intruder on your hospitality for the night, madam," he began. The dame still looked at the pigs. Mr Willoughby tried again, in less courtly phrase.

"Will it be convenient for you to lodge me to-night, ma'am? I have been disappointed in my search for a hunting-party, whom I had engaged to meet, and the night threatens a storm."

"I don't know nothin' about it; you must ask the old man," said the lady, now for the first time taking a survey of the new comer: "with *my* will, we'll lodge nobody."

'This was not very encouraging, but it was a poor night for the woods; so our traveller persevered; and making so bold a push for the door that the lady was obliged to retreat a little, he entered, and said he would await her husband's coming.

'And, in truth, he could scarcely blame the cool reception he had experienced, when he beheld the state of affairs within those muddy precincts. The room was large, but it swarmed with human beings. The huge open fireplace, with its hearth of rough stone, occupied nearly the whole of one end of the apartment; and near it stood a long cradle, containing a pair of twins, who cried—a sort of hopeless cry, as if they knew it would do no good, yet could not help it. The schoolmaster (it was his week) sat reading a tattered novel, and rocking the cradle occasionally when the children cried *too* loud. An old gray-headed Indian was curiously crouched over a large tub, shelling corn on the edge of a hoe; but he ceased his noisy employment when he saw the stranger; for no Indian will ever willingly be seen at work, though he may be sometimes compelled by the fear of starvation, or the longing for whisky, to degrade himself by labour. Near the only window was placed the work-bench and entire paraphernalia of the shoemaker, who in these regions travels from house to house, shoeing the family and mending the harness as he goes, with various interludes of songs and jokes, ever new and acceptable. This one, who was a little, bald, twinkling-eyed fellow, made the smoky rafters ring with the burden of that favourite ditty of the west—

> "All kinds of game to hunt, my boys, also the buck and doe,
> All down by the banks of the river O-hi-o;"

and children of all sizes, clattering in all keys, completed the picture and the concert.

'The supper-table, which maintained its place in the midst of this living and restless mass, might remind one of the square stone lying bedded in the bustling leaves of the acanthus; but the associations would be any but those of Corinthian elegance. The only object which at that moment diversified its dingy surface was an iron hoop, into which the mistress of the feast proceeded to turn a quantity of smoking hot potatoes, adding afterwards a bowl of salt, and another of pork fat, by courtesy denominated gravy: plates and knives dropped in afterwards at the discretion of the company.'

The traveller having received a cloudy assent from the settler to put up his horse in the shed, supper commenced. 'The grown people were accommodated with chairs and chests; the children prosecuted a series of flying raids upon the good cheer, snatching a potato now and then as they could find an opening under the raised arm of one of the family, and then retreating to the chimney-corner, tossing the hot prize from hand to hand, and blowing it stoutly the while. The old Indian had disappeared.

'To our citizen, though he felt inconveniently hungry, this primitive meal seemed a little meagre; and he ventured to ask if he could not be accommodated with some tea.

"Aint my victuals good enough for you?"

"Oh, the potatoes are excellent; but I am very fond of tea."

"So be I; but I can't have everything I want—can you?"

'This produced a laugh from the shoemaker, who seemed to think his patron very witty; while the schoolmaster, not knowing but the stranger might happen to be one of his examiners next year, produced only a faint giggle, and then, reducing his countenance instantly to an awful gravity, helped himself to his seventh potato.

'The rain, which now poured violently, not only outside, but through many a crevice in the roof, naturally kept Mr Willoughby cool; and finding that dry potatoes gave him the hiccup, he withdrew from the table, and seating himself on the shoemaker's bench, took a survey of his quarters.

'Two double-beds and the long cradle seemed all the sleeping apparatus; but there was a ladder, which doubtless led to a lodging above. The sides of the room were hung with abundance of decent clothing, and the dresser was well-stored with the usual articles, among which a teapot and canister shone conspicuous; so that the appearance of inhospitality could not arise from poverty, and Mr Willoughby concluded to set it down to the account of rustic ignorance.'

The question of bed accommodation for the traveller by and by came forward. 'The lady, who had by this time drawn out a trundle-bed, and packed it full of children, said there was no bed for him, unless he could sleep "up chamber" with the boys. Mr Willoughby declared that he should make out very well with a blanket by the fire.

"Well, just as you like," said his host; "but Solomon

sleeps there—and if you like to sleep by Solomon, it is more than *I* should."

'This was the name of the old Indian, and Mr Willoughby once more cast woful glances towards the ladder. But now the schoolmaster, who seemed rather disposed to be civil, declared that he could sleep very well in the long cradle, and would relinquish his place beside the shoemaker to the guest; who was obliged to content himself with this arrangement, which was such as was most usual in those times.

'The storm continued throughout the night, and many a crash in the woods attested its power. The sound of a storm in the dense forest is almost precisely similar to that of a heavy surge breaking on a rocky beach; and when our traveller slept, it was only to dream of wreck and disaster at sea, and to wake in horror and affright. The wild rain drove in at every crevice, and wet the poor children in the loft so thoroughly, that they crawled shivering down the ladder, and stretched themselves on the hearth, regardless of Solomon, who had returned after the others were in bed.

'But morning came at last; and our friend, who had no desire farther to test the vaunted hospitality of a western settler, was not among the latest astir. The storm had partially subsided; and although the clouds still lowered angrily, and his saddle had enjoyed the benefit of a leak in the roof during the night, Mr Willoughby resolved to push on as far as the next clearing, at least hoping for something for breakfast besides potatoes and salt. It took him a weary while to find his horse; and when he had saddled him, and strapped on his various accoutrements, he entered the house and inquired what he was to pay for his entertainment—laying somewhat of a stress on the last word. His host, nothing daunted, replied that he guessed he would let him off for a dollar. Mr Willoughby took out his purse, and as he placed a silver dollar in the leathern palm outspread to receive it, happening to look towards the hearth, and perceiving the preparations for a very substantial breakfast, the long pent-up vexation burst forth.

"I really must say, Mr Pepper," he began: his tone was certainly that of an angry man, but it only made his host laugh—"if this is your boasted western hospitality, I can tell you——"

"You'd better tell me what the dickens you are peppering me up this fashion for! My name isn't Pepper no more than yours is! Maybe that *is* your name: you seem pretty warm."

"Your name not Pepper! Pray what is it then?"

"Ah, there's the thing now. You land-hunters ought to know sich things without asking."

"Land-hunter! I'm no land-hunter."

"Well, you're a land-shark then—swallowin' up poor men's farms. The less I see of such cattle the better I'm pleased."

"Confound you!" said Mr Willoughby, who waxed warm; "I tell you I've nothing to do with land. I wouldn't take your whole state for a gift."

"What did you tell my woman you was a land-hunter for then?"

'And now the whole matter became clear in a moment; and it was found that Mr Willoughby's equipment, with the mention of a "hunting party," had completely misled both host and hostess. And, to do them justice, never were regret and vexation more heartily expressed.' A good breakfast restored all to harmony, and Mr Willoughby parted with his entertainers on the best of terms.

Mrs Kirkland, in extenuation of the coarseness of things in the west, says, 'Those to whose apprehension sympathy and sincerity have a pre-eminent and independent charm, prefer the kindly warmth of the untaught to the icy chill of the half-taught, and would rather be welcomed by the woodsman to his log-cabin, with its rough hearth, than make one of a crowd who feed the ostentation of a *millionaire*, or gaze with sated eyes upon costly feasts which it would be a mockery to dignify with the name of hospitality.' This may be true; but we cannot doubt that, when a people exchange the roughness of the early settlement for the refinement, and, it may be, greater coldness of a higher civilisation, they do it by free choice; and therefore, it may be presumed, from finding that, upon the whole, the latter is productive of greater happiness.

CHADWICK ON RAILWAY LABOURERS.

Mr Chadwick, the indefatigable enunciator of enlarged views on many subjects of social economy, has just laid before the public some papers of startling interest on the demoralisation, loss of life, and injuries occasioned by the present system of railway excavation. The facts which he produces are contained in statements from members of the statistical society of Manchester, and appear to be the result of careful inquiry: in all particulars they so essentially correspond with what we hear daily of railway workings, that they can admit of no debate, and demand the most careful consideration.

The digging of large masses of earth, and the blasting and removal of rocks, for the railways lately formed, and now in course of construction, have called into operation a class of labourers almost new in the country. First employed in cutting canals for inland navigation, these men received the appellation of 'navigators,' or 'naveys,' as the word has been abbreviated. Collected principally from the hills of Lancashire and Yorkshire, they display the strong Anglo-Saxon type: in point of physical stamina, they are altogether unequalled by any other race; while, under a rough exterior, are good mental qualities, susceptible of a high moral cultivation. Being reared without education, like the peasantry of England generally, they are valuable alone—to speak commercially—as engines of physical labour, and are drawn together in vast numbers by the temptation of high wages from railway contractors. Latterly, as railway digging has increased, they have become blended with hosts of miscellaneous labourers, and with Irish in still greater numbers—in all cases the groups being composed of men unprepared by culture for an absence of discipline and supervision.

Such are the operatives employed in the stupendous public works now advancing to maturity throughout the British islands—in England much more than elsewhere. Unfortunately, the execution of these works is seldom in the hands of the actual proprietaries. Railway directors are usually gentlemen connected with city life, who know nothing of engineering or manual-labour operations; and if it were otherwise, they cannot overlook the progress of the works nominally under their charge. It is found to be the best policy to let out portions of a line to a contractor, who engages to complete the excavations, bankings, &c. at a specified price. Contracting for railways has thus become a great business; so great, that there are men who will now undertake the whole works on a line—earth, stone, and iron work—all together; they again letting out portions to sub-contractors, and these sub-contractors letting lesser bits to what may be called sub-sub-contractors. In such arrangements, it will be observed, the proprietors or directors of the railway lose all connexion with the progress of the works: all they look to is having the contracts fulfilled by a stipulated day. Down and down through all the subordinate contractors there is the same disregard of everything but the completion of engagements; and hence the operatives—the men who are the real railway-makers—are at the mercy of a set of persons very little, if at all, removed above them in station, and who, from their very obscurity, are removed from any chance of obloquy.

The consequences may be anticipated; a state of demoralisation, crimes, riots, and confusion, fearful to contemplate in their present aspect, but still more so in what they are likely to become. Should the sanction of parliament be given to any considerable proportion of the new railway works presented for its consideration, and if no new precautions be taken in respect to

the mode in which they are conducted, some eight, ten, or twelve millions per annum, or as much as the annual expenditure for the whole of the effective and non-effective naval and military force of the country, will shortly be expended as wages for the payment of manual labour in railway undertakings. To aggravate the dangers to be apprehended, masses of untrained and inferior workmen will be congregated; while the superintendence, by competent engineers and superior officers of practical experience, must be diminished. Yet it would be difficult to conceive anything worse than what now is observable on various lines in progress.

Mr Robertson, a correspondent of Mr Chadwick, relates the following particulars of what he saw last June on the Sheffield, Ashton-under-Line, and Manchester railway. At the highest part of the country which the railway has to cross, the line is carried through a tunnel the longest in the kingdom, extending to five thousand one hundred and ninety-two yards, or nearly three miles. Here, as in most instances of railway workings, there is no town or village in which the labourers may reside; and rude hovels have been erected for their accommodation near the mouths of the shafts which penetrate the surface of the bleak moor, and at the two terminations of the tunnel. 'The huts are a curiosity. They are mostly of stones without mortar, the roof of thatch or flags, erected by the men for their own temporary use; one man building a hut in which he lives with his family, and lodges also a number of his fellow-workmen. In some instances as many as fourteen or fifteen men, we were told, lodged in the same hut; and this at best containing two apartments, an outer and an inner, the former alone having a fireplace. Many of the huts were filthy dens; while some were whitewashed, and more cleanly.' In these wretched hamlets, far removed from civilisation, from nine to fifteen hundred men had been crowded for the space of six years. Living almost like brutes, they were described as depraved, degraded, and reckless. Drunkenness and dissoluteness of morals prevailed. There were many women, but few wives; loathsome forms of disease were universal. Work went on in the tunnel without intermission, on Sundays as well as other days. No provision had been made at any period in reference to religious instruction, public worship, or visitation of the sick or wounded, by any of those having a pecuniary interest in the works. There appears, however, to have been a surgeon. A school for children, supported by the men, had been discontinued. The list of accidents reported to Mr Robertson embraced 32 fatal, and 140 severe cases—fractures, burns from blasts, contusions, lacerations, dislocations, eyes blown out, &c. A large proportion of these injuries were caused by the men *going to work more or less in a state of intoxication.*

The wages paid to joiners were 5s. per day, masons 6s., miners from 4s. to 5s. Such wages seem fair, if not what would be called excellent; but the whole thing is practically a delusion. Here we arrive at the execrable practices of the sub-contractors. The wages we allude to were paid only once in *nine* weeks, and the payment took place at a public-house—a beer-selling hovel. Think of a working man waiting nine weeks for his earnings, and getting from L.8 to L.10 in a lump! However, few or none have much to receive when the pay-day arrives. The great object of the contractors in thus staving off payment, is to drive the men either to take goods on credit at certain shops—technically called 'tally shops'—with which they are connected, or to accept of tickets, which, like cash in hand, they can exchange for articles at these establishments. The high prices charged for every article, and the frequent exchange of tickets for beer, absorb all the poor men's wages; and the nominal 5s. a-day is not worth perhaps two or three shillings in ordinary circumstances.

The practice of paying wages by orders on shops for goods, or, as it is called, the truck system, is contrary to law; but, in the present state of things, it seems impossible to prevent it. 'The labourer,' observes Mr Chadwick, 'who might want employment, has found that he could only get it on the recommendation of the beer shopkeeper, or the tally shopkeeper; the labourer has also found that, somehow or other, he could not retain his employment unless he took a certain quantity of beer from the beer-shop, or of goods from the tally-shop.' Supposing, however, that truck could be reached and put down, what is to prevent the sub-contractors from keeping tally and beer-shops, and only employing those men who would spend their wages at these establishments? Such has actually taken place in making the Rouen and Havre line. The wages are paid in money, but they are only transferred to the hands of sub-contractors, who keep chandlery-shops.

In Ireland, as we observe by an article in the Freeman's Journal (March 14), the mode of paying railway labourers is fully worse than anything we have heard of in England. It appears that it is a practice on the Mulingar line to pay wages monthly *by bill*, the bills being liable to a discount before the money can be realised. Many of these bills are for so low a sum as *one shilling*, and are made payable from twenty to thirty days after date, at an office in Dublin. The prevalence of practices of this sort is a scandal to the country, and ought by all means to be checked. Railway directors should be compelled to be more careful in the selection of their contractors. 'Their contracts for the execution of railway works,' says Mr Chadwick, 'are often undertaken at prices which their engineer, if he be a competent and honest person, must know cannot pay the contractors. I have been informed of one piece of work undertaken by a few contractors, who will lose by the work itself, but who will make upwards of L.7000 by the truck of beer and inferior provisions to the workmen. Here the interests of the contractors in the sale of beer were greater than in the good execution of the work, and men under their arrangements were often at work in a state of intoxication.'

One result, as already shown, of the intemperance which prevails at these works, is the number of fatal and severe bodily injuries which are constantly occurring. Another unhappy consequence of the general debauchery is deterioration of race. The children, born and bred up in the crowded hovels, are physically inferior to the parents, and are still more depraved morally. As long as the works are going on, these and other evils are not very observable by the public; for the hordes of labourers are living considerably apart from the rest of the community; but when the period of disbanding arrives, it is to be feared that predatory hosts of vagrants will be created, whom it will be difficult, as well as expensive, to repress. Of the present course of demoralisation to which these really useful men are exposed, perhaps enough has been said; but the few facts presented fall far short of the truth. The railway workers form a daily accumulating mass of savagery, with the worst vices of civilisation. They realise within the bounds of the United Kingdom a specimen of habits common only in the most barbarous tribes. Among them Christian and surnames disappear, and they become known and are entered in the contractors' books by the same species of cognomens as are fancifully adopted by roving Indians and other wild races.

As the condition of affairs we have been faintly picturing is neither creditable nor safe, the question naturally arises—how is it to be effectually remedied? Nearly the whole of the mischief may be said to be traceable to two things—the method of paying, and the method of lodging the men. Mr Chadwick suggests express legislative interference. Railway directors should be made responsible for the good behaviour of the labourers, as also the injuries which they may suffer by improper methods of working. The directors must bind their engineer to overlook and pay for the work of the contractors weekly: because, unless the contractors get their money weekly, they cannot be expected to pay it out

to their operatives at these intervals. The men should be paid in detachments—so many on Monday, so many on Tuesday, and so on; never all in a mass, and never at longer intervals than a week. The payment must be made in cash on the spot, not in a public-house. Moveable wooden habitations, each with at least two apartments, weather-tight, and well ventilated, must be provided in sufficient abundance to accommodate families in decency and health. Means for moral supervision and instruction are also called for, and might be provided in various ways. As to shops, it is exceedingly likely that, if the men were paid promptly in cash, every well-regulated colony would be provided with such establishments by ordinary competition. This, however, and all other matters, would be unavailing; laws of the most stringent order would go pretty much for nothing, and the present horrors would remain unabated, unless the supervision of such works were placed under an authoritative officer appointed by government. Properly qualified functionaries would require to move about among the lines in course of construction, everywhere seeing that the legal provisions were obeyed, and acting as magistrates to settle all petty disputes between workers and contractors on the spot. We agree with Mr Chadwick in thinking that all the degradation, iniquity, and misery which have been alluded to, is no more a necessary consequence of public works, than plague was to past populations, or than fever is now; and that if the means we speak of be adopted, there can be little doubt that railway labourers will become as orderly as any other portion of the community.

USAGES OF SOCIETY.

A CORRESPONDENT, a great stickler for etiquette, hands us the following hints; a knowledge of which, however commonplace, he thinks may be useful to those not up to the mark in this weighty subject.

'I shall begin with calls. When you call at the house of an acquaintance, or indeed call anywhere, and do not happen to find the party at home, you should leave your card. Leaving your name will not do; because names left verbally are seldom correctly delivered, if delivered at all, and your call may be said to go for nothing. Your card is the enduring evidence of your visit. The card is one of the most useful things in modern society. All are supposed to carry a small stock of these pasteboard representatives about with them, and the giving of one is very handy on many occasions. For example, in visiting, instead of sending in your name by a servant, hand in one of your cards, and then you may be sure there will be no mistake.

'Having either seen your acquaintance, or left your card, it is now the duty of your acquaintance (supposing it is a call of ceremonial intercourse) to return the call within a reasonable time. If he do not call, you do not repeat your visit. And why so? Because it may be his wish to drop your acquaintance, and your continuing to call on him may be disagreeable. Knowing that such is the rule, a second call from you seems like forcing yourself on his notice—a determination that he shall not rid himself of you. The rule of call for call, therefore, is on the whole not a bad one. It affords every one an opportunity of dropping an acquaintance when his society is no longer wanted. In good society, no one ever complains that an acquaintance has not returned a call—the thing is silently dropped.

'Calls of ceremony, which are not usually performed till past one or two o'clock, are seldom expected to last more than ten or fifteen minutes, and, as everybody knows, are performed in a plain walking-dress. Gentlemen, in making forenoon calls, or attending soirées, do not lay down their hat in the lobby, but carry it in their hand into the room, and never let it go, however long they stay. This is a very odd piece of etiquette, that has often amused me. I frequently see gentlemen walking about a drawing-room for hours, each cuddling his hat below his arm, as if it were a crime to part with it even for a moment. A man might as conveniently carry about a child's drum under his arm; yet he cannot well escape from the annoyance. If left in the hall at large parties, and worth the stealing, the unfortunate hat will in all probability be never more seen by its owner; for there appears to be nothing like conscientiousness in the matter of hats. How far the dread of losing the hat led to the practice of parading about with it under the arm, is of little consequence. The modern custom of keeping fast hold of it during short or extempore visits, is considered to indicate that you do not intend to stay any great length of time, nor expect an invitation to remain to dinner, or any other meal; in short, that it is your design to vanish after a little friendly chit-chat. Thus, laughable as it seems, there is really a meaning, and not a bad meaning either, in the practice. A host who wishes you to remain, or at least not to go in a hurry, will beg to relieve you of your incumbrance.

'Next as to invitations. When you ask a person to dinner, let it, if possible, be done a week or ten days in advance; because, to ask a person only a day or two days before, looks as if you had been disappointed of somebody else, and had asked him as a mere stop-gap. A short invitation is only allowable for off-hand parties, or with strangers who are passing through a town.

'When you invite a person to dinner, or any other party at your house, specify only one day. Don't say you will be glad to see him on either of two days, as Tuesday or Wednesday next. And why? Because this person may not wish to dine with or visit you at all; and so far from a choice of days being thought an act of kindness, it may be considered one of servility, if not rudeness. Always state only one day; and let the invitation, like the answer, be unequivocal.

'Invitations for several weeks in advance are almost as bad as invitations for alternative days; because long invitations convey the impression that the inviter is desperately ill off for guests, and wishes to insure a number at all risks. The person invited is also apt to feel that it is not *his* pleasure or convenience that is consulted; and to raise a feeling of this kind is anything but consistent with true politeness.

'The receiver of an invitation has a duty to perform as well as its giver. It is incumbent on him to say *yes* or *no* at once—not to allow a post or a day to elapse before answering. The reason is obvious: a delay on his part looks as if he were waiting for a better invitation before he made up his mind. Not to send a speedy reply, therefore, is one of the worst pieces of breeding of which a man can be guilty. It is also not using the inviter well: for a dinner-party usually consists only of a certain number; and if you cannot accept the invitation, say so, in order that time may be allowed to invite another person in your place. Let the answer also be distinct: no uncertainty is allowable: and if the invitation be accepted, let it be kept.

'The answer to an invitation should be directed to the lady of the house.

'I now come to the fulfilment of the engagement. Some time ago it was fashionable to be rather late—twenty minutes after the hour being considered a fair thing. Now, prompt to the hour is the rule, which is a great improvement. In attending two or three dinners lately, I found that all had assembled within the space of ten minutes.

'A drawing-room is the domain of ladies, and on entering, you first make your obeisances to the lady of the mansion, who is of course ready to receive you. Leading the ladies down stairs to the dining-room is a simple affair; yet one may be a novice in this as well as in everything else. The rule is, for the lady you take down to sit on your right hand, if that can be managed conveniently. But when you take down the lady of the house, you sit on her right hand—that is, you have the seat of honour. It will not do for any guest to rush forward to offer his arm to the lady of the house. The honour of leading her down, if not assigned by the host to a favoured guest, is taken by the most

elderly gentleman, or by the party of highest rank present. To save all doubt on this point, the host almost always asks one of the party to be so good as take Mrs So-and-so down stairs. Where the party are generally strangers to each other, it is customary for the host to make a similar request to the other gentlemen as respects the other ladies. The host selects the lady of greatest consequence, and leads her off first. The hostess waits to go down last—sees all go down before her.

'In going down stairs, the lady should have the widest side, supposing the stair to have a narrow and a wide side, as is the case with winding-stairs. Better, however, take the wrong side, than make any fuss about correcting so small an error.

'A custom, lately come in, seems to be deservedly gaining ground: instead of sitting at the top and bottom of the table, the host and hostess sit opposite each other at the middle; by which means they are more at ease, more in the centre of their guests, and better able to communicate with each other. George IV. adopted this practice twenty years ago: it is followed by the present queen. According to this arrangement, two persons can be accommodated at each end of the table—not a bad point where there is limited accommodation.

'A dinner-party usually lasts four hours. If you go at six, you may order your carriage at ten; if at seven, it may come at eleven; and so on. What dinner hours are by and by to come to, I cannot tell. Not many years ago, dinner at five o'clock was thought mighty genteel; then we had half-past five; next came six, and six and a-half—both of which are now general; but seven is also far from uncommon. That the fashionable dinner hour will be pushed on to eight, to nine, or to ten, is what we may reasonably expect. When it comes to this pass, will dinner bound back to its ancient hours, or will it be extinguished as a formal meal?

'So much for dinners: now for a little about personal decoration: and here I address myself chiefly to ladies. In giving a dinner or evening party, take care to dress somewhat less elegantly than any of your expected guests; because, were you to dress much more elegantly, it might be supposed that you invited the party only to astonish them with your finery, or at least to show them that you could afford to dress better than they—a thing not likely to be agreeable to their feelings. As under-dressing may be considered disrespectful to guests, it is equally to be avoided with over-decoration. Good taste will suggest the proper medium.

'I must say a word on tokens of sympathy. "If you wish me to weep, you must weep with me," says the Roman poet. Quite reasonable this. If you wish to condole with a friend, you must at least employ the emblems of wo. In calling on an acquaintance who is in mourning, put on a little mourning also—don't go in flashy attire, out of character with the occasion. If your correspondent seals his letters with black, seal your replies with black also. These may be trifles, but if they tend to give any one gratification, why not practise them? A thousand comforts in life depend on what are intrinsically trifles.

'The prompt answering of letters is considered an unequivocal mark of a gentleman and a man of business. Why is delay the reverse? Because not to answer a letter (supposing it deserves to be answered) is the same thing as not answering when you are spoken to; and everybody knows that that is bad enough. Yet some people, who mean nothing wrong, but are only ignorant of what is due to the feelings of others, are most remiss in the answering of letters, and will allow days and weeks to elapse before despatching a reply. When letters are conceived in an impertinent or intrusive spirit, it is of course allowable and reasonable to let them remain unanswered. Persons of notoriety, for example, who are pestered with letters on all sorts of frivolous subjects, frequently for no other purpose than to get hold of their autograph, may very excusably take some latitude in regard to this rule.

'In asking after the health of a person's relations, give each his or her proper name and title, unless it be a child. Ask for Mrs ——, or Miss ——, and so on: never say, "How is your wife?" "I hope your daughter is well?" &c. Any such mode of address is intolerably over-familiar, and is almost certain to give offence. Calling persons "My dear sir," or "My good fellow," in speaking to them; also holding them by the button—an offence denounced by Chesterfield—are, for the same reason, objectionable.'

NOTES.

SAVINGS' BANKS.

A correspondent, signing himself 'An Englishman,' makes a few remarks on the paper on Savings' Banks which appeared in the Journal of January 17, being chiefly an abridgment of a paper by Dr Chalmers in the *North British Review*. This gentleman laments that, in that paper, the view of advantages from little accumulations to the working man should be so much limited to provision against sickness and old age. He contemplates, and it appears to us with justice, benefits gilding and improving the general current of the labouring man's existence, as a possible result of saving. In many circumstances 'a labourer,' he says, 'having realised a few pounds out of his wages, may rent an acre or so of land, buy an additional pig, take advantage of a right of common for a cow or a sheep: as he goes on, he may add field to field, till he has almost a farm. Such things are done; and undoubtedly not only is a better style of living so attained, but even greater security is made against evil days of every kind, than by continuing to board in a savings' bank. In other circumstances men may improve their condition by similar means. Hundreds of suitable expedients suggest themselves to the frugal and vigilant man who possesses a little money. I remember some remarkable instances of colliers advancing themselves, by dint of little savings, from the common working situation to that of renters of levels, and that while they were still young men. I know an instance of a young man who, from an occupation yielding one pound a-week, raised himself to one bringing in five hundred per annum; and what were the means for effecting such a change? A lady gave him L.15 to rent a level in the railway construction; which was speedily repaid with gratitude. So serviceable may a little accumulation prove even in the humblest walks of life!' We are content that these remarks should speak for themselves; only deeming it necessary to add, that there may be virtue and happiness in the homes of the labouring classes without such an employment of savings; but yet it is undoubted that, in the present constitution of society, we generally see both improved in proportion as absolute poverty is left behind.

THE GREGORY FAMILY.

With reference to a paper in No. 102—*Does Talent go in the Male Line?*—a correspondent strengthens our argument for a so-far favourable answer to that question, by telling us that the series of Gregories holding professional chairs in Edinburgh during the last hundred years, is of the same family with the equally celebrated mathematicians of the preceding century. As this family history may be regarded as a curious natural fact, showing the long descent of certain characters of mind, we give some of the details of our correspondent's letter.

'The first man of any note in the family was John Gregory, minister of Drumoak, son of a burgess of Aberdeen, whose father or grandfather was a M'Gregor from Glenlyon, a younger son of M'Gregor of Roro in that valley. The minister of Drumoak lived during the civil wars, and seems to have been "gay canny," for, like the vicar of Bray, he stuck in through all the troubles, and bought a good estate—Kinairdy in Banffshire. He married a lady named Anderson, the daughter of a man possessing remarkable mechanical abilities, and herself a woman of superior intellect. She it was who is supposed to have brought the talent into the family. Of the minister's eldest son, it is only recorded that he was stabbed in a fray by Crichton of Frendraught. The second, David, the eldest of Miss Anderson's children, succeeded to the estate. He was taught mathematics by his mother, and was considered a good geometrician, though only as an amateur. David had twenty-nine children, who of course ate up his estate; but three of them were professors of mathematics at one time; namely, David, first of Edinburgh, afterwards of Oxford, a friend of Newton, and a first-rate mathematician; James, and Charles. The son of David became professor of history at Oxford, and dean of Christchurch. He had three sons, who, being by their mother connected with the English aristocracy, took to horses and dogs, and soon died out. The dean's fine library was bequeathed to the late Dr James Gregory of Edinburgh; but somehow was neglected at Oxford, and, I believe, finally lost and embezzled. Either James or Charles, the brothers of the first David, had a son Charles, also a professor of mathematics. It is also worthy of note, that from two daughters of the first David Gregory came two other professors; namely, Professor Irvine of Marischal College, and the celebrated Dr Thomas Reid, author of the Inquiry into the Human Mind; both of whom were mathematicians.

'It is well known that Dr Reid was originally a clergyman, though, his faculties not lying that way, he never acquired any reputation in the profession. The following (original) anecdote of

the great metaphysician, strikingly proves the inapplicability of his powers to the pulpit. In a parish close to Old Aberdeen lived a kind of half idiot, who had an amazing memory, insomuch that he could repeat any sermon which he heard even after years had elapsed; and his great pleasure was in listening to sermons and repeating them. When Reid, as an elderly man, visited his old university of King's College, he heard of this man, and was anxious to see him. He went accordingly with the man's laird, who introduced Reid, and requested the man to give a specimen of his powers by repeating the sermon of the preceding Sunday. "I dinna ken," says the man, "if I can do that; but I'll tell ye what I can do; I'll let ye hear the sermon that your freend here preached in our kirk mony years syne. Atweel he was a puir hand." Reid did not much relish the proposal; but when he heard the fellow begin and repeat correctly a sermon which he had actually preached there about twenty years before, and which was really a miserable production, he turned on his heel without waiting for the conclusion of this remarkable proof of memory.

'I have now to go back to James, the third son of the old minister, and the younger brother of David. This was the inventor of the reflecting telescope. He was professor of mathematics first in Aberdeen, afterwards in Edinburgh, where he died early of apoplexy, following a sudden attack of amaurosis, which is said to have come on while he was showing his pupils the planets of Jupiter through that tube by which he had so much increased the power of vision to the rest of mankind. He was, as well as his nephew David above-mentioned, the friend and correspondent of Newton, many of whose letters continue in the possession of James's descendants. In fact these Gregories were among the first to adopt and teach Newton's views; they did so long before those views were admitted at Cambridge. His son James became professor of medicine in King's College, Aberdeen, holding the very same chair which, a hundred years later, was occupied by one of his descendants. He was a man of strong sound practical sense, and is still remembered locally as the author of many improvements. He planted, in 1726, the *Mediciner's Glebe* with the fine trees now ornamenting it; and a dike on the Don is still called after him *Gregory's Dike*. He acquired a fishing on that river, which now belongs to one of his descendants. He had two sons—James, who at one time held the same medical chair; and John, who also held that chair, but was invited to Edinburgh, and there distinguished himself. He wrote a "Father's Legacy to his Daughters," an often-printed book, and "A Comparative View of Man and the Animal World," one full of common sense, and which has contributed most powerfully to the introduction of rational habits among our ladies, in reference to the nursing and physical education of their children. He also published "Lectures on the Duties and Qualifications of a Physician," a work distinguished by a high strain of morality, and still looked upon as a standard.

'Dr John Gregory had two sons—James, professor of the institutes of medicine in the Edinburgh university, and who stood at the head of his profession in that city, author of the well-known "Conspectus Medicinæ;" and William, who entered the English church, and had a stall in Canterbury cathedral. Of Dr James's family, one is the present professor of chemistry in Edinburgh; another, Donald, who died in 1836, was a profound and accurate antiquary, and author of a book of extraordinary research, entitled "A History of the Western Highlands and Islands;" a third, David, died in youth, but not before acquiring the character of a first-rate mathematician at Cambridge, where he had established and conducted a mathematical journal. In him the original talent of the family might be said to have blazed out in all its pristine lustre; for the two intermediate generations, although entitled to be called good mathematicians, had not distinguished themselves in this line. Finally, it ought not to be forgotten that one of the daughters of Dr John Gregory was the mother of Dr W. P. Alison, who succeeded his uncle in the chair of the institutes of medicine; and of Archibald Alison, author of the History of the French Revolution.'

It thus appears that from the clever Miss Anderson, who lived in the time of Cromwell, have proceeded *fourteen professors*, some of them men of extraordinary ability, and one of them a great inventor; besides other men of eminence in literature and philosophy. As talent has thus descended, ever since the first generation, from male to male, it would appear that the favourite theory of its descending invariably through mothers is inconsistent with facts. One particular in the history of the Gregories is peculiarly striking—the sudden outbreak of the original mathematical talent, after having had only a subdued existence through three generations. We are forcibly reminded by it of what Washington Irving tells of the revival of family features in great-great-grandchildren.

It is also somewhat curious to reflect on this long list of eminent men having had their remoter origin in the solitudes of Glenlyon, amongst the wild clan Gregor. This reminds us of an anecdote which Sir Walter Scott gave in the final edition of his novel of Rob Roy, and which cannot be the worse of being here reprinted. Rob was, it seems, sent by the Earl of Mar in 1715 to raise the armbearing men of a portion of the clan seated near Aberdeen. 'While in this city, he met a relation of a very different class and character from those whom he was sent to summon to arms. This was Dr James Gregory (by descent a Macgregor), the patriarch of a dynasty of professors distinguished for literary and scientific talent, and the grandfather of the late eminent physician and accomplished scholar, Professor Gregory of Edinburgh. This gentleman was at the time professor of medicine in King's College, Aberdeen, and son of Dr James Gregory, distinguished in science as the inventor of the reflecting telescope. With such a family it may seem our friend Rob could have had little communion. But civil war is a species of misery which introduces men to strange bedfellows. Dr Gregory thought it a point of prudence to claim kindred at so critical a period with a man so formidable and influential. He invited Rob Roy to his house, and treated him with so much kindness, that he produced in his generous bosom a degree of gratitude which seemed likely to occasion very inconvenient effects.

'The professor had a son about eight or nine years old, a lively stout boy of his age, with whose appearance our Highland Robin Hood was much taken. On the day before his departure from the house of his learned relative, Rob Roy, who had pondered deeply how he might requite his cousin's kindness, took Dr Gregory aside, and addressed him to this purport:—"My dear kinsman, I have been thinking what I could do to show my sense of your hospitality. Now, here you have a fine-spirited boy of a son, whom you are ruining by cramming him with your useless book-learning; and I am determined, by way of manifesting my great good-will to you and yours, to take him with me, and make a man of him." The learned professor was utterly overwhelmed when his warlike kinsman announced his kind purpose, in language which implied no doubt of its being a proposal which would be, and ought to be, accepted with the utmost gratitude. The task of apology or explanation was of a most delicate description; and there might have been considerable danger in suffering Rob Roy to perceive that the promotion with which he threatened the son was, in the father's eyes, the ready road to the gallows. Indeed every excuse which he could at first think of—such as regret for putting his friend to trouble with a youth who had been educated in the Lowlands, and so on—only strengthened the chieftain's inclination to patronise his young kinsman, as he supposed they arose entirely from the modesty of the father. He would for a long time take no apology, and even spoke of carrying off the youth by a certain degree of kindly violence, whether his father consented or not. At length the perplexed professor pleaded that his son was very young, and in an infirm state of health, and not yet able to endure the hardships of a mountain life; but that, in another year or two, he hoped his health would be firmly established, and he would be in a fitting condition to attend on his brave kinsman, and follow out the splendid destinies to which he opened the way. This agreement being made, the cousins parted, Rob Roy pledging his honour to carry his young relation to the hills with him on his next return to Aberdeenshire, and Dr Gregory doubtless praying in his secret soul that he might never see Rob's Highland face again.

'James Gregory, who thus escaped being his kinsman's recruit, and in all probability his henchman, was afterwards professor of medicine in the college, and, like most of his family, distinguished by his scientific acquirements. He was rather of an irritable and pertinacious disposition; and his friends were wont to remark, when he showed any symptom of these foibles, "Ah, this comes of not having been educated by Rob Roy!"'

SONNET.

THE mirthful spring hath come to us at last:
Down her bright brow she shakes the sparkling dew,
And from her leafy screen peeps laughing through,
Coaxing to distant climes the nipping blast!
The mossy buds spring proudly up and fast;
For her white arm and robe of wavy blue
Daintily o'er their tender shoots she threw,
Till the fierce Wind King should have ridden past.
Now, undisturbed, we feel her dear caresses,
Now from the rainbow-foam strange music sending,
Now, as her graceful foot the green earth presses,
The forest minstrels their soft tones are blending;
And the rich incense from her amber tresses
Comes from her golden throne in clouds descending.

F. B. S.

IMPORTANCE OF THE VEGETABLE KINGDOM.

In Great Britain a very large proportion of the imports consists of raw produce, obtained from the vegetable kingdom. Thus in the year 1836, the net-produce of the custom-house duties amounted to L.22,774,991. Of this large sum not less than L.21,127,455 was collected upon vegetable, L.1,177,091 upon animal, and only L.72,323 upon mineral substances. These sums are certainly not in proportion to the importance to the country of the three kingdoms of nature, as the exports consist chiefly of manufactured articles, both of mineral and animal products, as well as of the vegetable substances previously imported; but they very strikingly confirm the commercial importance of the vegetable kingdom.—*Dr Royle.*

MY FATHER THE LAIRD.

[It may be well to state that this piece—the first of a short series in which, as it appears to us, domestic life is sketched with singular spirit and fidelity of pencil—is really what it appears to be, the composition of a lady advanced in life, the daughter of a Highland proprietor of ancient name. This first paper depicts the north-country gentleman of the conclusion of what we may call the age of old-world things—the time when there was no systematic agriculture, no struggling activity, and only a simple and antiquated kind of refinement. A second paper shows a transition state of things in the middle of the last war; and a third, we believe, will set forth the contrast afforded by the present stage of society.]

It must be above a hundred years since my father was born, for he did not marry early, and I, his youngest child, am now something past seventy. I have always heard that he was near his fiftieth year at my birth. My first recollection of him is as an elderly man, grave, yet kind in manner, passing through the quiet routine of his life with the dignity befitting the laird of the wild Highland glen that was his heritage. Of his youth I know little. In those days children held but distant intercourse with their parents; they seldom shared their confidence, either as to memories of the past or plans for the present or the future. Orders were given and obeyed, with a little sternness on the one hand, and extreme submission on the other; and thus was preserved the distance in position then considered essential to good family government. I learned, however, that he had been partly educated at Aberdeen, that he had made one or two journeys to Edinburgh, had even been in London, and, upon some particular occasion, had gone from thence as far as Dover, where he had had a peep of the French coast.

My mother was not a Highlander, on account of which defect she had never been thoroughly popular among her husband's vassals, whom, perhaps, she did not sufficiently understand to be enabled to conciliate. She was of an ancient border race, descended from some of those moonlight riders whose fame has hardly passed away with their rude age, yet who were so little accounted of by the proud clans of the Highlands, that, despite her beauty, her grace, her unwearied benevolence, my mother never, in their eyes, filled the place of her predecessor, my grandmother, the Lady Rachel, a termagant of a woman, who ruled her whole household by the help of a good stick, and fed ever so many rebels in the caves and woods in the very face of the government.

The beautiful glen appropriated by my ancestors several long ages ago, when 'might' made 'right' all over the 'north countrie,' runs deep up into the chain of hills which stretches across the central Highlands, lost in a pine forest at the upper end, and at the other expanding towards one of the many considerable lakes intersecting these solitudes. A small river, frequently interrupted in its course by rocky birchen-wooded banks, falls within a mile of the lake, over so steep a precipice, as to entitle it to the reputation it has long maintained, of being one of the finest bits of scenery in the district. About the middle of its descent the stream is broken by a high, black angular rock, dividing the water into two diverging cataracts. On a sort of natural terrace raised from the meadow, backed by the gray mountains, the lake in front, the stream at hand, the waterfall in full view, stood, in my father's day, the ruins of an old massive tower, with the usual long, high, narrow steep-roofed house attached to it. It was the ancient seat of the family; but my father, since his marriage, had never lived there, my grandmother, the much-revered Lady Rachel before-mentioned, having demurred as to the necessity of removal from the place she was used to. My gentle mother, therefore, had prevailed on him to occupy, in the meanwhile, what had been the jointure house on the property, a mile or two farther up the glen; and when, in the course of years, the castle became vacant, they had grown unwilling to leave this their humbler dwelling-place. They found, too, it would be cheaper to add to it than to repair the more chieftainly-looking residence. They therefore built two heavy square wings to the lowly centre, with what was called a back 'jamb' for kitchens; walled in a bit of ground behind for a garden; set the barn, the poultry-house, the forge, and a labourer's hut or two, down in full view on one side; the stables and cow-sheds in an equally conspicuous situation on the other; with a duck-pond in front, and a sun-dial before the door, to watch over it; and the whole premises being at a most respectful distance from every appearance of a tree, it was altogether the only ugly spot in the neighbourhood.

Within, the arrangements quite corresponded to the taste displayed without. I almost forget now how all the different rooms were connected; but I know that half the family lived on the ground-floor, the remainder up in the garrets, leaving the first floor entirely for company. My father and mother occupied a small parlour, with a sleeping-closet adjoining it, in one wing; my French governess and I had the same extent of accommodation in the other; the old but-and-ben were turned into rather a handsome entrance-hall, and what would have been really a fine dining-room, had the ceiling been higher. There was a good staircase too, leading up to a long, narrow drawing-room, and the bed-chambers for visitors. My four brothers, with their tutor and the servants, were all packed away in the garrets, as were the apples, the feathers, and the onions.

The furniture was for the most part plain enough. In the dining-room I remember neither curtains nor carpet; yet I think there must have been a bit of carpet, French fashion, round the long table. There was

a sort of beaufet at the end of the room, well filled with plate and glass upon occasion; silver mugs, and jugs, and horns deeply tipt; a large waiter or two, and a couple of vases, with plenty of long-stalked, though very small glasses, some of them with spiral stems curiously embossed or fluted; and three different-sized real china punch-bowls, and a great quantity of small silver-edged horn ladles. My mother's parlour, where we always breakfasted when alone, had, in the winter, a home-made carpet, diced black, yellow stuff curtains, and a high-backed couch. In a closet near the fire, she was in the habit of putting all such delicacies as she reserved for our private entertainment; or rather for hers and my father's, as we children seldom came in for more than the plainest fare. The mantelpiece was covered with snuff-boxes, of every sort of shape and value, amongst which were a few foreign shells. Over it hung, crossed, my father's two swords in dirty red bags. The drawing-room was more magnificent. The curtains were of silk, fringed the same as the bed-hangings and the curtains of the best bedroom, which opened out of it. The carpet, though not quite covering the room, was a purchased one, and handsome; the tall chairs, ranged in rows against the walls, were covered with my mother's own needlework; the walls themselves were hung with family portraits—the Lady Rachel figuring there in dishevelled hair and a flame-coloured gown; and on the mantelpiece was a large glass-case, filled with white paper flowers, manufactured by my French governess, who had also made a filigree basket, inlaid with what we children called sheep silver, gathered from the granite stones by me, her pupil. It stood on a small table near a harpsichord, opposite to a neat cabinet. There was also a round table, on which was set a tray of tea china—the cups hardly bigger than those of the doll sets of this age—made of the clear egg-shell china, and really used, as I have seen, in an afternoon by my mother and such lady guests as occasionally occupied the state bedroom. Tea was not at that time a daily luxury with us. As a meal, my mother never got reconciled to it; her own usual breakfast was soup, and wheaten bread baked on the girdle, with a very small glass of brandy after it. Meat, fish, wine, spirits, bread, milk, sometimes chocolate, were served before the guests. I think my father generally took porridge. The breakfast was late—so was the dinner; but my recollections of these very early days are confused, as I mixed but little with the company.

When alone, my mother's usual morning dress was a chintz bed-gown over a quilted petticoat, and on her head a square handkerchief of cambric, trimmed with lace, placed straight across her forehead, and pinned at the back beneath its extra drapery, which, hanging down behind, formed a high ear on either side, something like the *coiffure* of the old Rochelle fisherwomen, or the prints of our Henry of Bolingbroke. By the middle of the day she was dressed in her dark silk full-skirted gown, or her Joseph of warm cloth in winter; a lace handkerchief, or a thick shawl over her bosom, according to the season; her hair slightly powdered, and pulled oddly up from her forehead to the crown of her head, supporting a flat muslin cap, with a deep flapping frill, and long ends of ribbon dangling from it. In fuller dress there was more cap, and more lace, and more powder; and I remember once or twice a little hat, with puffs of ribbon and feathers; to honour which, her long diamond ear-rings were added, and a single string of pearls, or a black velvet band with a diamond clasp, fixed round her throat. Her brooch in full dress was my father's picture set in brilliants, altogether about the size of a modern card-case. She had one dress which I do not remember to have ever seen her wear, and which I have now beside me, among other venerable curiosities. The petticoat was white quilted satin, covered with a silver net, looped up by silver tassels; the gown was open, edged with silver fringe, and composed of white watered lutestring, embroidered in silver. It was probably her wedding-dress, from the care that was taken of it. Her occupations were all quiet, for her health was indifferent; yet I always remember her as busy and cheerful. She rose early, gave her orders in the family, heard me read my 'chapter,' read herself for a short time in some serious book, took a turn in the garden, gathered herbs, prepared her confectionary, or her sirups, or her infusions—for she was both head cook and head apothecary—and then she worked chair covers, and stools, and rugs, like her great-grandchildren. She seldom moved from home; neither had she often ceremonious company to entertain; but a chance visitor was a very frequent occurrence, as my father's was a house where the passing guest was always welcome.

My father's time was less fully occupied, as in his day the care of property was a very simple matter. The little crofts, stolen from the thick birchwood that clustered upon every bank throughout the glen, were let in small patches to innumerable tenants, who paid their trifling rent in kind or labour—so many days' work, so much corn, so many peats, so much poultry: our own farm supplied the rest; and all the money he ever looked upon was what his large flock of sheep produced him. His pipe was therefore of some importance; he opened his red-flapped gold-laced waistcoat after dinner, reclined in one of those corner chairs with a low circular back, which presented its lozenge-set seat to the curious in antique comfort, and holding the long pipe lightly across the fingers of his beautiful hand, he indulged in a reverie no one ventured to disturb. I have him now before me—calm, serene, placidly enjoying the quiet he loved. His wig was short-tailed, slightly powdered, off his forehead, and the strings of stiffened hair that fell from it nearly reached his shoulders; the wide long-skirted coat possessed no collar, nor did the shirt; and the deep cuff of the coat-sleeve did not reach down within an inch or two of the full shirt-sleeve, which was finished by a double ruffle, that showed to much advantage the shape and colour of his hand. I don't think he was handsome; there were no features of particular beauty, no expression but serenity; yet there are moments when my early-formed taste, shocked by the bustle of modern manners, has reverted with regret to the gentlemanly repose of my father.

He had two brothers, one of whom he had long lost sight of; for, by some strange accident, very uncommon in that age, he had gone in his youth with his regiment to India. The other, my uncle the captain—for, as a matter of course, he also had been a soldier—had seen some service in various parts of Europe; he had, however, retired early from his profession, owing to some disgust he had received in it, and he had lived for many years at a small farm not very distant from our own. The captain being a bachelor, passed much of his time at my father's; he had his long pipe too, and he sat at the opposite side of the fire to the laird, keeping him silent company. They were very unlike. The laird, negligent in air and in dress, seemed to play with his whiffs of tobacco; while it was quite a matter of business with the captain, who, stiff, erect, with plaited stock and ribboned queue, and short decisive manner, smoked in good earnest so many puffs to the minute.

My uncle's home was a mere cottage; a parlour with the usual sleeping-closet adjoining it, a spare room for a friend, and the kitchen. Very scanty was the furniture, very few the servants, very simple the fare; but they suited both the habits and the finances of the captain, with the help of the laird's fireside. My brothers and I liked to visit the captain. Besides the bowl of broken milk, the cranberry jam, the cheese and thickly-buttered oatmeal bread his old housekeeper gave us, my uncle had stories of the wars which we were always glad to listen to—long histories of his few campaigns, tales of his dull or gay garrison life, frightful sea-storms he had encountered in his transports, and the usual degree of injustice his merits had been requited with. Over his fireplace hung a very martial

array of swords, daggers, pistols, and carbines, with a military sash festooned around them. He had a small garden, in which, besides the common vegetables then cultivated, was a hedge of gooseberries never pruned—so full of hairy fruit, small of course, but so sweet, so highly-flavoured, I would give all the gigantic insipidities of these gardening-days for one Scotch pint of my uncle the captain's black gooseberries. He took some pride in them himself, and had particular pleasure in observing them to ripen by my mother's birthday—a gala-day duly celebrated. Our nearer relations, when they could be reached, were always invited to it, with many of their retainers, and all our own people, from every corner of the glen. There was a dinner in the long dining-room, and a dinner in the barn, which was afterwards cleared for dancing—gentle and simple meeting in perfect fellowship.

Upon this occasion the captain invariably wore his uniform. It was a little tight—for his regular habits, and his native air combined, had rather encouraged an inclination in his figure to rotundity—yet it suited him well; the long queue figuring almost as an upright, while his head was bending low before my mother, with whom the etiquette of years had established that he was to open the ball. The chapeau bras pressed tightly under one arm, the other was extended resolutely to touch with its single-fingered point the gently-raised hand of his partner. Quietly and gracefully I remember my mother moving through the slow strathspey in her long, rich full gown, her stately head and diamond drops; while my uncle's busy feet—in the neatest of low-quartered shoes, where sparkled most brilliant buckles—worked merrily away in double time to the family 'rant.'

I had two aunts, both of them younger than my father, and both married long before I had any recollection of them. They were settled in different directions, each more than what was then a good day's journey from us. They had married well—lairds suited to such ladies. My uncles-in-law were 'well connected and well descended,' and for their means they had acres enough, whatever they made of them. One attribute of wealth they possessed in abundance—overwhelming families. My Aunt Grace had latterly brought five sons and two daughters to the family gatherings—her stock; while my more discreet Aunt Penuel selected for inspection only a few specimens from the eight or ten sturdy urchins that enlivened her home.

I wish I could call to mind more accurately the habits of those long-past days; but, as will be seen, my connexion with this dearly-loved home of my childhood was early severed; and thus deprived of any assistance in recalling what has left so few traces of what was once existing, my young memory proved faithless to many of its first impressions.

My brothers were studiously kept as much apart from me as possible: the only meal we shared together was dinner. It was my mother's wish that her daughter should be educated in advance of the age; and this she thought would be effected by in-door employments, instead of healthy romping without. My governess had no delight in exercise. A French novel, her coffee, her embroidery—these were her recreations. She particularly disliked the tutor, who was too young for a lover, too unpolished for a companion. What he taught my brothers I never knew. They seemed to be mostly occupied in fishing, rowing, riding, and, in the proper season, shooting and deer-stalking. They certainly passed a few hours daily in their attics, when whatever studies they pursued there, must have been considerably entertaining, were we to have judged from the loud bursts of merriment which issued from their apartments. My mother sometimes ventured to remark, in her gentle way, that she doubted whether my brothers were making much progress. My father replied in his, that the boys looked healthy, and seemed happy; and the captain added, that in the army a good constitution was of much more consequence to an officer than any amount of learning; so that matters proceeded with them as usual.

We had no neighbours: the wide moors on either hand were all my father's; the lake was broad enough to form a barrier between our retired glen and the more fully-inhabited opposite shore. We were therefore little disturbed by its population. A bridle road only led on some twenty miles to the military highway, for which General Wade had to be venerated. We were therefore thrown upon ourselves for our occupations, and upon our humbler retainers for our general companions. They were not few: old servants, some still capable of their duties, others retired on trifling pensions to small turf-huts erected for them; old tenants of various degrees, from the humble tiller of a few acres, to the distant relation with a larger farm, and perhaps the half-pay of a lieutenant in addition to it; and the young of all, with whom we habitually mixed—none of any rank ever for a moment losing sight of our relative positions; for there is an indescribable superiority of manner, I believe I may say of character, among the Highlanders as a people, which raises the humblest of them completely above the rank of modern peasantry. They were then quite unskilled in the ways of life beyond their mountains—unacquainted with any of the refinements of luxury, even with many of the arts necessary to decent comfort; full of old prejudices, bigoted to old habits, devoted to old attachments, not over-cleanly in house or person, idle, irritable, and upon some points impracticable. Yet there was a dignity of mind common to them—a self-possessed deportment, springing from their peculiar condition, which made them no unfit associates for the higher members of the clan with whom they felt themselves to be connected.

My father had a 'grieve'—a Donald Dhu, or Black Donald—whose father, grandfather, and, for all I know, great-grandfather, had been grieves before him. He lived in one of the many dwellings close at hand, and his wife tended the cows and the poultry for my mother; in fact this wife—a pretty and a stirring woman—was the real head of the whole establishment, for she had the most perfect control over Donald; Donald was all-powerful with my father; and my father's slightest wish was law to my mother. Donald and Eppie were careful creatures, honestly guiding their master's business as they would have done their own—badly enough, I believe, but to the best of their ability. They were far from being overworked; they had leisure-time to fill our young heads with the grandeur of our ancestors, the pride of feeling requisite in our important station, and such other topics of feudal principle as suited the haughty spirit of the Highlanders. Towards nightfall of a winter afternoon my brothers and I, when we could escape from our respective superintendents, were happy to gather round Eppie's neatly-swept hearth, which she would render more cheerful by setting a small torch of bog-fir on a stone slab, left purposely for it in the chimney; and there she would entertain us not only with tales of the clans, or anecdotes of our own family, or stories of the late rebellion, but with legends of the goblin inhabitants of every spot of note in the country. Some of these long-descended superstitions were beautiful in their imagery, poetical in every sense, with generally a moral tendency even in the few instances of retributory horrors occasionally inserted among the lighter fictions. The Highland fairy is not a sanguinary avenging demon; there is nothing of the gloom of the Goth among the supernatural agents of our traditions, at least rarely. Puck, with his frolic fun, is more akin to the mischievous revels of our fays and brownies, which, for the most part, rather aided than impeded the affairs of the race with which they were connected. I recollect, however, that when an Allister Mhore—literally Muckle Sandy, or the Big Shepherd, as his name had been translated for my mother's southron ignorance—joined our fireside party, the legends of men and fairies assumed a much more harrowing form.

Allister's employment necessitating, for the greater part of the year, a solitary life, a gloom had crept over his mind. Following his flock up to the hollows among the bare hills, inhabiting for weeks his lonely bothie, or sleeping in his plaid beneath a stone, tracking the stragglers through the heath and forest, or to the silent corries near the rocks, he came to imagine voices in the storm, shapes in the mist, the graves of the murdered near every cairn, or the wail of the drowned by every torrent, and along the shores of the lonely lake. There was a very aged cowherd, or bowman, as in those days they named him—his office having, in olden times, obliged him to protect his cattle with a cloth-yard shaft—almost in his dotage from the weight of years, who had himself, in his youth, been spirited away to fairy-land; and though after a while restored to his lamenting relations, he had never thoroughly recovered from the effects of the spells then thrown round him. An ugly red shock-headed fox-hunter, a great ally of my elder brother's, had had his experiences of these deceptive associates—having danced a whole twelvemonth with them with a sack of meal upon his back, the cords supporting which had worn through the skin to the bone, from the weight he had borne on his shoulders through this long reel; for it was on Hogmanay night that he had been persuaded, by a little group of merry folk in green, to enter a bothie with them, and join their revels, he being on his way home at the time with this provision for his family; and it was on Hogmanay again, a twelvemonth after, that, on the ending of the reel, he took his leave of his pleasant entertainers; without an offer of refreshment, however, which accounted for his spectre-like appearance on his return to mortal society. An old 'Bell,' too, had in her youth seen many wonders, and heard of more, so that our stores of such learning quickly accumulated; and though all these legends were in a manner discouraged in the parlour, my father and my mother, and even the captain, had each heard of one or two extraordinary facts, so strangely authenticated, that they confessed they hardly dared to doubt them—the mysteries of nature being acknowledged by them to be unfathomable. We fathomed them all by the help of our numerous humble acquaintance; for we knew all, each and all, by name and calling, and felt an interest in their fortunes fully reciprocated.

Several times a-year my father collected his followers around him. On my mother's birthday there was always, as I have mentioned, a dinner and a ball; at harvest-home another; on Christmas-day—old Christmas-day, for in our glen we knew nothing about the new style—there was a ba'-playing in the morning, a supper and a dance at night; and in summer, in the clipping season, when every one was collected at the sheep-cote, high up towards the hills, this most serious business of the year was finished with perhaps the merriest of all his entertainments; for it was in the bright June weather, out in the fresh air, all that was beautiful in mountain scenery around us. These were happy times: at least I was a happy child, finding, like others of my age, amusement in the objects around me; and if there be truth in the importance of early impressions, receiving on a ductile imagination such as tended to nourish a wild poetry of feeling, which, like other human associations, was fruitful both of good and evil. Educated in our youth my brothers and I were not: to avoid such habits as were considered beneath the dignity of a son or daughter of our race, was the extent of our moral training. We had the example, too, of the naturally high-bred manner of our parents; and so far as these causes could influence tempers, ours were regulated. Our 'princely' position taught us to know that on our affability depended the ease of all with whom we associated: neglect would have been painfully felt; any want of courtesy would have been looked on as unkindness. It was therefore of necessity that politeness grew with us; it was not condescending, impertinently-condescending politeness, neither was it haughty: it was simple. It was the noble, neither jealous of his rights, nor arrogant in their exercise towards the vassal, too secure in self-respect to refuse the homage due to his chieftain. My father was indeed the father of his clan. Accessible to all, interested in all, he was everything in every way to all his people. I have a pleasant recollection of my father, he was so thoroughly the gentleman. In his rude dwelling, with his simple habits, unlearned, unrefined, he was the head of an ancient race unmistakeably.

I must not forget, among these sketches of the olden time, the minister, as his ballad lore made his company of some consequence in our quiet home. Yet there was little to mark him by: he was neither a rigid disciplinarian, nor a moving preacher, nor a busy, meddling censurer of foibles he was himself exempt from. He was 'just an honest man,' as Miss Nelly, another affectionate friend of my childhood, described him; taken up with the care of his little glebe, and the value of his bolls of victual, and the decent bestowal of his only son, and of his several industrious daughters, in some suitable employments. The wife I don't at all remember; yet she was there, in the kirk on Sunday, at the manse when called on, and once or twice in the year at the house by invitation: still I cannot recollect her in the least. The minister I well remember—a short, rosy man, in his well-worn suit; the best maker of punch in the parish, and always the life of the company.

Miss Nelly was a distant relation; from what particular dell, or haugh, or mountain-side she came, I know not; neither am I clear as to whom among our numerous cousins she was descended from. The purpose for which she came to us was to 'keep the keys,' when my mother's increasing delicacy of health made the management of her family too great an exertion for her. Miss Nelly, though of a good height, and what the Highlanders call handsome—that is, well-shaped—was far from being a beauty; indeed her face was plain, without one good feature, a little pitted with the small-pox, and freckled; her complexion suiting the light sandy hair, she wore unpowdered, neatly twisted round a high comb at the back, and kept in order by the snood, that was bound rather low on her forehead. But who that knew her worth ever thought about the beauty of Miss Nelly? She was like an abiding gleam of sunshine in the house, so gay, so active, so kind, so good; cheerfully, faithfully doing her own duty, encouraging rather than commanding all around her to do theirs. After her arrival, all had to bestir themselves; even Black Donald had to look about him, for the keen eye of Miss Nelly penetrated far and near. What churnings and yernings followed her care of the dairy; such baskets of eggs, such fat fowl, such well-reared calves, had never been seen about the place before; and how the wheels birred of an evening in the kitchen! Such webs of linen, and woollen, and linsey, as filled the old chests on the garret landing. In my mother's quiet reign, as much was not spun in a dozen years as Miss Nelly had off to the weaver, the result of one winter's labours. Yet the whole household liked her. Then she sang with a voice of such sweetness, and power too, when she chose to exert it, a few good merry songs and several plaintive ballads, as the 'Ewe Bughts,' which I well remember. But she shone in her Gaelic airs, the lilts known to the shepherds and the dairy-maids, and the boat-songs of the western isles. They were beautiful in themselves, most beautiful as she sang them. Then for family history she was as good as a chronicle. She had every incident of the rebellion off by heart, though she was only born as it burst forth; but she was christened with a white cockade on her cap, taken by Prince Charles from his own breast, and thus made his devoted adherent for ever. She kept the precious relic in a box, almost her only valuable, and she sometimes allowed us to have a peep of it. She also showed us many places where his followers had found shelter in the glen, among the rocks and caves by the river side, and in the woods; and she took us often to the old

tower, down near the lake, and pointed out the back window in the lower storey out of which my grandmother, the Lady Rachel, used to sally with her confidential maids to carry provision to their hiding-places.

It is like a dream to me now these recollections of my childhood. The world we live in is so unlike this time long past. I often think of it to sadness, for the marked character of the scenery and the people made impressions never to be removed from a partaker in all the associations of a chieftain's state. We were rude in those distant Highlands, for we were removed from the course of civilisation, which was even then polishing away the peculiarities of distinctive races; and we were proud, for we had never seen our superiors, and we had but little intercourse with our equals. Have we gained by the change of habits which the progress of 'improvement' has produced? I am too old to feel myself sufficiently unprejudiced to answer this wide-spreading question. I have undertaken to give my grandchildren my impressions of their Highland ancestry, and I will leave to them the comments on my simple facts.

ST HELENS AND ITS GLASS-WORKS.

THERE is no county in England to whose importance manufactures have so much contributed as that of Lancaster. Nature has denied to it the charms which arise from a rich soil or a variegated surface, but has given instead rich beds of coal, and two important navigable rivers. When, therefore, machinery began to be commonly used, and America sent large quantities of raw cotton, to be spun by English skill into clothing, the great resources of Lancashire became available. Steam machinery was established where it would be nearest to its requisite food —coal; and cotton-mills sprung up in that district which was nearest to the great port that communicated with America. Population was attracted to the county, and almost every village that had a favourable situation grew apace into a large and wealthy town. An attempt will be made, in the following sketch, to give a picture of one of these, which, though now containing a population of about eighteen thousand, was, twenty years ago, but a small and insignificant place.

The town of St Helens is situated about eighteen miles to the west of Manchester, and is reached by a branch railway, three miles in length, communicating with the line between Liverpool and Manchester. It is in the centre of a rich coal district, and has, by means of railways and canals, the most easy communication with the port of Liverpool and other parts of Lancashire and Cheshire. So plentiful is coal in its neighbourhood, that, from an eminence near it, the country is seen for miles around thickly studded with collieries; and while that mineral is selling in Liverpool at fifteen shillings and sixpence per ton, it can be purchased at St Helens for seven shillings and sixpence, at the mouth of the pit. In a few places the coal-beds crop out in the soil, and in passing over one or two fields, the attention of the visitor is directed to what appears to be a quantity of coal-dross scattered about, but which, in reality, is the edge of the coal-seam. This excellent supply of fuel renders St Helens an admirable site for those manufacturing processes which require a powerful heat; and this consideration, together with its vicinity to the extensive salt-mines of Chester, have made it one of the most important seats of the glass manufacture in England.

The first view of St Helens, as of most other manufacturing towns, is not very prepossessing. It lies on a piece of level ground, surrounded by a few gentle eminences, and seldom on any week-day is it without its overhanging cloud of smoke. Through this the visitor sees irregular masses of brick houses, two or three churches with square towers, tall chimneys vomiting smoke, and conical glass-houses giving out occasional bright flashes of flame. The clank of hammers ringing against iron is heard from many a forge and foundry, and a strange compound of smells proceeds from a chemical work which rears its head close by the railway station, and in the suburbs of the town. The streets have apparently been laid out without any plan, as chance or interest might direct, and the houses, which are chiefly of two storeys, are as plain as a combination of lime and bricks can well be. In many of the streets only one side has been built up, and there are therefore various vacant spaces of ground, which, in rainy weather, contain pools of water, and prove anything but conducive to health. Like many other manufacturing places, St Helens seems to have been built in a hurry, the attention of the inhabitants being so much absorbed in advancing manufactures, that they would care little about the kind of houses they should provide for themselves. There is much truth in a remark which was once made, that 'our manufacturing towns too much resemble the hasty encampment of settlers in a new country, anxious to avail themselves as speedily as possible of its natural advantages.' And yet it is to such towns that Britain owes its greatness as a manufacturing country; and it is out of St Helens that we obtain that clear, pellucid, and most transparent of all substances—glass; which is of such vast importance to man, and which is daily used, in some way or other, by almost every human creature.

Manufactured glass is of three kinds—plate, crown, and flint. The first is used for mirrors, shop-fronts, &c.; the second for glazing ordinary windows; and the third embraces all such vessels as tumblers, decanters, &c. In St Helens all these kinds are manufactured. There are two establishments for making plate-glass, two for flint-glass, two for crown-glass, and one where bottles (green glass) are made. The most important of these is situated on a gentle eminence in the neighbourhood of the town, and called Ravenhead, the road to which is strikingly characteristic of the present age. The visitor walks for some distance along the banks of a canal which connects St Helens with the Mersey river. On each side of this canal are seen various manufactories, with their tall 'steeple chimneys' clouding the air with smoke. On the water various vessels, called flats, are seen loading and unloading with glass, coal, and other articles. The canal terminates at a large establishment for the smelting of copper, and near it is a confused heap of sandy-looking refuse, cast out from some manufactory. The road then ascends to Ravenhead—the largest plate-glass work in the kingdom. It was established in 1773, at a time when foreign nations were so much more skilled in manufactures than the British, that the first workmen had to be procured from France. It was carried on by its original founders at a pecuniary loss: in 1798 it changed hands, and came into the possession of a company called the 'British Plate-glass Company,' by whom the manufacture has ever since been conducted. The establishment at Ravenhead occupies more than thirty acres of ground; the original cost of the buildings was L.30,000, and upwards of three hundred hands are regularly employed. The cottages of many of the workpeople surround the works, and the whole establishment is like a little colony. The various stages of plate-glassmaking may be thus described:—It is well known that glass is obtained by the fusion of sand. To enable the sand to fuse, it has to be combined with what chemists call an alkali, or a body which combines with an acid, and produces salts. The alkali used at the works in St Helens is soda, obtained from common salt. The sand employed is procured from the sea-shore at Lynn, in the county of Norfolk, near the estuary of the sea called The Wash. Various other chemical ingredients are used, and the proportions of each substance necessary to form a good plate are thus given by the chemist, Mr Parkes:—

Siliceous sand, washed and sifted,	720 lbs.
Alkaline salt, or soda,	450 ...
Quicklime, slacked and sifted,	80 ...
Nitre,	25 ...
Broken plate-glass,	425 ...
	1700 lbs.

This mixture, which will yield, on an average, 1200 lbs. of good glass, is put into pots, and then placed in the furnaces. It is carefully examined while the smelting

process is going on, and gradually refined until it is found to be in a fit state for casting.

The house at Ravenhead in which this process is performed is remarkable for its extent and appearance. It is nearly 350 feet long and 150 broad. On entering, the visitor sees two gloomy passages extending the whole length of the building, and lighted only by the bright glow proceeding from apertures in some of the furnaces. In the centre are the furnaces containing the prepared mixture, and at each side are what are called the 'annealing ovens.' These are chambers in which the glass, after it has been cast, is subjected to a slow and gradually-decreasing heat, until it is quite cool. In these ovens, plate-glass usually remains about fifteen days. Glass which is not subjected to this process is sure to fall into fragments when exposed to any change of temperature. The well-known experiment of the Rupert drops, which, after being held in the hand for some time, suddenly explode, and become a mere mass of sand, is performed with pieces of glass which have never undergone the annealing process, but been allowed to fall among water. There are upwards of forty of these ovens at Ravenhead. Each is sixteen feet in width, and extends forty feet back. Various groups of workmen are seen moving about in the most strange and striking costumes. Some have the eyes protected from the heat by a piece of transparent cloth or gauze, which hangs in a curious fashion from the cap on to the shoulder. Their dress is very scanty, and of course not at all clean. The face and hands are streaked with black, caused by the perspiration and coal-dust. At each end is seen a massive iron table, on which the glass is cast. These tables rest on a framework, and are heated by a quantity of hot coal placed in a pan underneath their entire length. They are on a level with the surface of the annealing ovens, and are supported on wheels, by which they are moved on a railway from one end of the building to the other. They are composed entirely of cast-iron, and are fifteen feet long, nine broad, and six inches in thickness. Across each is seen a heavy cylindrical roller, and alongside is a massive crane, and other apparatus for lifting the metal.

When the composition, or 'metal,' as it is usually called, is in a fit state for being cast, the pot containing it is hoisted out of the furnace by means of the crane, and suspended over one of the tables, which is carefully swept down, so that no specks of sand or dust may rest on its surface. Small iron slips, of the same height as the thickness of the required sheet of glass, are placed all around. The pot is then inverted, and the metal allowed to run gradually over the surface of the table, reaching no higher than the shallow borders of iron. The heavy cylinder is then rolled over its surface, to smooth it down into proper shape. The whole of the operation is conducted in perfect silence, and the glare of the red-hot metal cast on the grim attentive features of the workmen, gives a fearful, as well as picturesque appearance to the scene. The glass, as the roller passes over its surface, displays, like the dying dolphin, a great variety of brilliant colours. The process requires to be conducted most carefully; for, should any air-bubbles be produced, they will cause blisters to appear on the surface of the plate, which must consequently be cut across at the place where they are seen. 'The casting' usually takes place once each day, and the quantity cast daily at Ravenhead is generally eight tables, or about one thousand square feet of glass.

The surface of the plate being left rough by the casting, it has to undergo various other processes before it can be used. After lying a sufficient time in the annealing ovens, and after the rough edges have been cut away, it is conveyed in large quantities, by means of a railway, to the grinding-sheds. The appearance of these is entirely different from that of the building where the casting process is performed. The casting-house is gloomy and silent; the grinding-shed is full of light and noise. Plates of glass are here cemented to large stone-flags, which are placed on supports at regular intervals. Other plates are cemented to frames above. The surfaces of the upper plates are placed on the surfaces of those attached to the stone, and the frames are connected by an iron rod with machinery, which causes them to revolve. The one surface of glass is thus made to grind the other. These frames are attended by boys, who throw fine sand and water alternately on the surface of the lower piece of glass, and who chant a rude kind of song, to keep time with the screeching noise of the machinery and the grating of the plates of glass against the sand and each other. When one side of the plate has been ground enough, it is reversed, and the same process is adopted with the other side. The glass, on being removed from this shed, presents a dim, obscure appearance; the surface is rough and scratched, and it is not yet fit for use. It is then conveyed to another shed, where it undergoes a similar but finer process of grinding. Here the upper plates of glass are fastened to a frame, which is moved by women. If the plate is small, one woman only works at it; but if large, two or more are necessary. The glass is then taken to be polished—one of the most delicate processes of all. This is done by small wooden-blocks, covered with cloth where they come in contact with the glass, and working in frames, which push them backwards and forwards over the surface of the glass, on which is strewn a reddish kind of polishing-paste. By the constant action of these polishers, the plate is at last brought to a beautifully smooth and transparent state, and is then quite fit for use.

Those plates which are intended for mirrors are taken to another house, where they are 'silvered.' This is accomplished by laying down a sheet of tinfoil on a stone slab; on this some mercury is poured, in a quantity regulated by the size of the plate. The glass is then carefully pressed down on the mercury, the pressure being equal in every direction. In a day or two the mercury combines with the tinfoil, and both adhere to the back of the glass, thus forming a mirror. This process is likely ere long to be superseded by the cheaper and more simple process of Mr Drayton, described in No. 96 of our present series.

All these processes are performed on a great scale at Ravenhead. Different houses and different workmen are appropriated to the different processes; and so distinct are the various operations, that a workman who has a perfect knowledge of one is often very ill-informed about all the rest. Since the abolition of the duty on glass, the demand has become very great, and the quantity of plate-glass now used is enormous. Its effect on the appearance of the shop-fronts in our large towns is particularly striking. The great aim now is, to have only one pane of glass in one window; and thus shopkeepers are enabled to display their goods to more advantage, and to produce a more pleasing effect than could be done under the old system of numerous panes.

The manufacture of crown-glass is a process quite different from that which has just been described. The 'metal' is prepared in a similar manner; and as soon as it is ready for use, the workman inserts a tube into the melting-pot (which still remains in the furnace), and gathers on the end of it such a quantity of the metal as, from long experience, he knows is sufficient to form a circular piece of glass. The metal adheres readily to the iron, and is kept from falling off by the tube being turned rapidly round. It is then rolled on an iron slab, and, by a little blowing, is made to expand and assume a long pear-like form. At this stage the tube is handed to another workman, who blows it still more, and heats it at other furnaces, until it expands into a nearly globular form. When this is accomplished, the blower rests the tube in a horizontal position, and another workman gathers a small portion of metal on the end of an iron rod, by means of which he attaches the original globular mass to his rod. The tube is then withdrawn, and the globe conveyed to the mouth of another furnace, before which it is made to revolve. It is beautiful to see how the glass then gradually expands centrifugally, until, in a few minutes, it acquires a perfectly circular form of about five feet in diameter. It is then carried away, the edges glowing of a bright-red colour, and placed on a soft cushion, where the tube is detached, leaving on the surface of the glass that mark which is usually called a

'bull's eye.' The piece is instantly lifted and placed in a perpendicular position in the annealing oven, where it remains about two days, after which it is ready for use.

There is another kind of glass made in St Helens, called sheet-glass. It was first manufactured in Germany, and the principal workmen engaged in it here are foreigners. The process in some respects resembles that by which crown-glass is made; the difference being, that the glass is blown into a cylinder, circular at one end and convex at the other. As may be imagined, it is very difficult to make the glass assume this form. After the workman has blown it into a long oval shape, he stops the end of the tube, and heats the opposite end of the glass at the furnace. The air is thus made to expand, and to break, for its escape, an aperture at the end of the glass, which, by heating and turning, is enlarged until it is precisely of the same diameter as the whole mass. The convex end is made to fly off by causing it to be heated and then suddenly cooled. A hollow glass cylinder then remains. A diamond is drawn across this from top to bottom, and it is removed to an oven, where it is placed in a horizontal position. The action of the heat causes it to divide where the diamond has been drawn, and the workman, by means of a piece of burnt wood, smooths it down to a plane surface. It is then placed upright in the annealing oven. None but those who have felt it, can form any idea of the intense heat which has to be endured in many of these establishments. The visitor, unaccustomed to it, is, soon after entering the glass-house, bathed in perspiration; and there are few who can look for more than a few seconds on the fearfully-bright white glow of some of the furnaces.

Besides these glass-works, St Helens contains five foundries—three for brass, and two for iron; several manufactories of earthenware; and various other works. Indeed, from the quantity of coal used in these establishments, and the elaborate scientific processes which are there carried on from day to day, this town may be regarded as a great laboratory, where the coarsest and rudest materials are, amid smoke, rubbish, and intense heat, changed by the skill of man into beautiful articles to minister to the wants and luxuries of life.

THE MIDNIGHT RIDE.

BY PERCY B. ST JOHN.

Some years ago, when the American fur company and the Hudson Bay traders carried on a powerful opposition to each other in the wild and rocky territory of the Oregon, several little forts were erected in the interior, whence the commerce in peltries was made with the Indians. One of these, to which our tale refers, was planted in a green and secluded valley, where pasture for cattle and comfort for man were as much as possible combined with security and safety. A little stream, bordered with cotton-wood and aspens, afforded a constant supply of water; while in the grand and magnificent valley of the Bayou Salade, at no great distance, pastured, in inexhaustible thousands, the buffalo and the elk; its rivers abounding, moreover, with the beaver, whose skins principally induce the hunters to tempt the dangers of the great American wilderness. In this spot, known as Spokan Fort, dwelt James M'Pherson, the owner and governor of the wild locality. M'Pherson was a Scotchman, who in early days had left his native country a poor lad, and now, by the exercise of that perseverance characteristic of his countrymen, had attained the position of a well-to-do merchant. Of an enterprising disposition, he had penetrated into the interior in search of further wealth; and having for some two years settled himself at Spokan, had there driven a thriving trade with the Indians, despite the impediments thrown in his way by his rivals. Nothing can equal the excitement of this precarious commerce. It is the constant effort on the part of opposition companies and traders to out-general the other, to mutually blind their opponents as to their destination and plans, as well as to be ever in the field first. These efforts give rise to almost superhuman exertions, and tend to sharpen the wits of all parties in a very sensible manner. He who shows the greatest knowledge of Indian tastes, of the haunts of the beaver and buffalo, of the time to move and the time to go into winter quarters, is sure to make the most successful campaign. M'Pherson was shrewd and acute, and these qualities serving him in good stead, his affairs advanced in a very satisfactory manner.

It was about two years after the establishment of the fort, and when all were in activity and bustle, that Edward Ray, a young Louisianian, obtained an appointment under the owner, and travelling the whole distance from New Orleans, had convoyed a cargo of merchandise for the use of the company. In addition to this, he had taken up, to rejoin her father, Miss M'Pherson and a female attendant. So peculiar and so long a journey had thrown the young people much together, and without any reflection with regard to their difference of position, a mutual affection had arisen between them. Under these circumstances the voyage up the Mississippi and across the vast interior plains was of a most agreeable character. Both lingered upon deck to admire the bluffs and grassy plains, the vast interminable prairies; and never wearied of their gaze. The desert even had charms; and when the Rocky Mountains burst upon them in all their sublimity, their pleasure was complete. At length, however, they arrived at their journey's end. Ray became a clerk, and Miss M'Pherson presided over the establishment, as the daughter of the owner was in duty bound to do. Whatever might have been the lady's feelings, the poor clerk sought not to learn. He felt the difference of station, and, shrinking from any manifestation of his aspiring hopes, attended to his business honestly and diligently, but without ever showing the slightest enthusiasm for the avocation. Under these circumstances he was considered useful in his way, but failed to excite that notice which might have led to his advancement. Reserved and taciturn, even his mistress thought herself deceived in him. With the excitement of their happy journey, all his energies appeared to have departed. The truth was, that Ray, who was not of a sanguine disposition, saw no means of rising to a level with his master, and allowed despondency to unnerve his spirit.

About three months after his arrival, the time approached when the annual interview with the various Indians took place: a meeting of much importance, as then the whole fortunes of the year were decided. It was usual to appoint a place for the natives to camp with their beaver and other skins, where the rival traders then repaired, and whoever offered the best price, obtained a ready and profitable market. About two days before the time appointed, the heads of the fort were seated at their evening meal. Plenty and variety made up for delicacies and seasonings. Buffalo, deer meat, trout, salmon, wild-fowl, all abounded on the board—round which sat M'Pherson, his daughter, Ray, and three other clerks. The whole party were engaged in discussing the good things before them, when a bustle was heard without, and, after the pause of a moment, a half-bred hunter appeared on the threshold.

'What news, Nick?' said M'Pherson, who recognised in the intruder a scout sent out to learn the proceedings of the rival traders.

'Bad,' said Nick, advancing. 'Master Sublette got ahead of Spokan. The Indians all at camp already, with plenty beaver. Master Sublette buy up all, but him got no tobacco, so he send away to Brown for some; then smoke, and buy all the beaver.'

'Why, that is good news,' said M'Pherson laughing; 'if Sublette has no tobacco, all is right. We have plenty; and not an Indian will sell a skin until he has had a good puff at the pipe of peace. So up, my men,' he continued, addressing his clerks; 'you must away and out-general Sublette, by taking Johnson a good supply of the weed.'

'All very fine,' said Nick with a knowing jerk of his

head; 'but Sublette him know a trick worth two of that. A hundred Blackfeet are outlying in the woods, and not a soul will reach the market until they are gone.'

'The Blackfeet!' cried M'Pherson; 'then we are defeated surely. What is to be done?'

'How many bales will suffice?' said Ray quietly.

'If Johnson, our agent, had but one,' replied the trader despondingly, 'all would be right. It is impossible, however; and this year is lost to me.'

'By no means,' said the clerk, rising, with all his native energy and fire beaming in his eye; 'Johnson *shall* have the bale, or my scalp shall hang in a Blackfoot lodge before morning!'

'Edward!' exclaimed the daughter with an alarmed glance, which opened the father's eyes to what hitherto had been a profound secret.

'Are you in earnest, Mr Ray?' said M'Pherson gravely, and even sternly.

'I am, sir: give me Wild Polly' (a favourite mare), 'and trust to me for accomplishing your wishes.'

'You will go alone then?'

'I will.'

M'Pherson ordered the mare he valued so much to be saddled, and in half an hour Edward Ray, with two bales of tobacco behind him, and armed to the teeth, sallied forth from Spokan amid the plaudits of the whole party, whose astonishment regarded less the perilousness of the adventure, than the character of the man who undertook it. Miss M'Pherson, conscious of the interest she had betrayed in her father's clerk, hastily retired to her chamber; while the father, after carefully fastening the gates, and posting proper sentinels, lit his pipe and seated himself, absorbed in reflection, by the huge fireplace in the principal apartment. Great smokers are your Indian traders, who in more things than one resemble the men with whom they have to deal.

Meanwhile Edward Ray, after leaving the fort, rode slowly down the valley, reflecting on the wisest course to pursue. Before him was a journey of seventy miles, with a hundred wild Indians thirsting for a pale face victim; the no less welcome that he owned a horse, and carried a rare prize in the shape of two bales of tobacco. Ray felt that he had rashly ventured on a wild and doubtful enterprise, and, under ordinary circumstances, would have soon turned back; but he knew the opinion his fellows had of him, and felt with pride that no one had offered even to accompany him. Besides, in the presence of her he loved, he had undertaken his bold task, and was determined that she should not think him indifferent and timid. A ride of half an hour brought him out of the valley, and upon the skirt of a plain of some extent. Here Ray halted, and gazing upon the prairie that lay at his feet, endeavoured to discover some sign of the Blackfeet. The moon shone brightly upon the waters and woods, and not a sound disturbed the stillness of an American night in the wilderness. Ray felt the influence of the hour and the place; and forgetting all but the delight of travelling by the moonlight over that plain, removed thousands of miles from civilisation, set spurs to his mare, and trotted swiftly along the path leading in the direction of the Indian mart. It was some time ere the young clerk paused, and then a sudden hesitation on the part of his mare brought him back to consciousness. Raising his eyes, he found himself close upon a wood, between which and a somewhat broad river he had now to pass. A single glance told him that Indians were near, as a light smoke rose from amid the trees: whether they had yet discovered him, was a matter of uncertainty. Ray therefore determined to make a bold dash; and, trusting to his beast, rode at a hard gallop along the skirt of the forest. The moment he neared the trees, his hand upon his rifle, he listened with the most anxious attention. Not a sound, save the clatter of his unshod mare, was heard, until he had half-cleared the dangerous cover. Then came the sound of horses in pursuit, and then the Blackfeet war-whoop, with the crack of rifles. His enemies were in full chase. Now it was that the gallant steed put forth her energy, and now it was that Ray's spirit rose, and that he felt himself a man, with all a man's energies, and also with all a man's love of life. Looking back, he saw the wild Indian warriors coming fast towards him, but still not gaining ground; and he felt sure, did he loosen his precious merchandise, and give it up to the pursuers, that he could with ease outstrip them. But he was resolved to serve his master's interests, and he urged his laden steed to her utmost. An hour passed in this manner. The howling, whooping Indians, half a hundred in number, gallopped madly after him, their long spears waving in the moonlight, and their black hair streaming to the wind.

Before him lay a cane-brake, where the reeds rose ten feet, dry, parched, and crackling. Through this lay the path of the fugitive. Ray looked forward to the welcome shelter, determined to make a stand; and there, at the very entrance, stood, mounted on a tall horse, an opposing foe. Clutching a pistol, the clerk clenched his teeth, and rode madly against this new opponent, who, just in time to save himself, cried, 'All right—Saucy Nick!' There was no time for greeting, and away they scampered through the cane-brake; not before, however, the half-bred had cast a brand amid the reeds. They had not proceeded a hundred yards ere a wall of fire rose between them and their pursuers. Magnificent was the scene which now greeted the admiring eyes of Edward Ray as he halted on the other side of the brake. The reeds, scorched by the summer sun, were as inflammable as straw, and the flames spread with astonishing rapidity to the right and left. The poor birds that sheltered in the morass below, alarmed, rose on the wing, and flying a few hundred yards, halted to gaze at the fire, which seemed to fascinate them; the wild animals, too, clinging to their lairs until the fire touched their very nostrils, would then unwillingly rise, and, leaping over it, scour over the black plain of cinders in the rear of the flames. As the two fugitives retreated, the scene became more magnificent, for the blaze was then seen in the distance creeping to the right and left in sparkling and brilliant chains. Then, as the wind arose, it hurried after them: as the roar of a distant cataract it was heard; while the heavens were overcast with the dense volumes of smoke that ascended.

'Away!' cried Nick, urging his steed to the utmost; 'the Fire-spirit is awake; he rides in yonder cloud! Away, or our bones will be mingled with those of the red men upon this plain.'

'But, Nick,' said Ray, as side by side they dashed across the prairie, 'how met we? I left you at the fort?'

'No! Nick start half an hour before. Wouldn't let brave warrior go by himself. Found him chased by Indians—Blackfeet; but Indian no take Master Ray. Nick know trick worth two of that. But hush!' he added, as they gained the entrance of a valley; 'the hoofs of our horses have waked the great Fire-spirit; but we are not yet free. Blackfeet in valley.'

At this intimation of their being again about to meet a party of their enemies, Ray prepared his arms once more, and then patting the neck of his gallant steed, urged her at a rattling pace through the valley. A flash, and the crack of guns fired in haste, showed that Nick was not mistaken; but giving a volley in reply, and without pausing to discover its effect, the pair gallopped onwards, and once more emerged upon the plain. Nick now led the way, and diverging from the ordinary route, entered a stream, the course of which they followed slowly for some time. At length, satisfied that he had baffled pursuit, the half-bred once more entered upon the usual track, and, before daylight, reached the great camp, where the Indians had pitched their tents with a view to traffic with the rival white men.

To the right were the wagons of Sublette; to the left those of Johnson, M'Pherson's agent. They found the latter in very bad spirits, as his rival was expected to

receive the necessary supply of tobacco in the course of the afternoon, when all chance for Spokan would have been over. As, however, Ray detailed the object of his journey, and the success which had attended it, the agent's eyes glistened, and at length he exclaimed with a chuckle, 'Bravo, Mr Ray; I should just like to be in your shoes; for if you haven't made old Mac's fortune, my name is not Johnson. Such prime beavers you never saw. By the immortal head of General Jackson but you are a lucky dog!' Ray expressed his satisfaction at having been of such great service; and after a hasty meal, the traders began their day's work. First the chiefs were summoned, and regaled, to the consternation of Sublette, with a liberal and plentiful smoke. Seated round the agent's tent, the Spokan, Kamloops, Chaudieves, Sinapoil, and other Indians, enjoyed with unmixed satisfaction what to them is a most precious luxury. The agent was most liberal of the weed: not a single Indian was forgotten: and when the barter commenced, the gratified aborigines testified their delight by disposing of their skins in an equally liberal manner. Such, indeed, was the activity of the Spokan agent, and of his assistant Ray, that when Sublette received at length his supply of tobacco, not a beaver nor even a skunk-skin remained for which he could trade. Well aware that the Blackfeet, when once discovered, would draw off, Ray, after a brief hour of repose, borrowed a fresh horse, and hurried back towards the fort. His journey was tedious in the extreme, for the smouldering grass rendered it as unsafe as it was disagreeable. At length, however, the young clerk, to whom had returned much of his former despondent feeling, came once more in sight of Spokan, where he was received with open arms, as was Nick, who accompanied him.

M'Pherson, eager to learn the result of the young man's journey, drew him to his counting-house, and motioning him to a seat, installed himself at his ledger, with pen in hand. Ray began his story, and, to the evident surprise of the merchant, related the dangers which had befallen him, and the manner in which he had escaped. At length he came to that part of his story which referred to the extraordinary quantity and excellence of the beavers which had been obtained by means of his bold undertaking.

'Know, lad,' said old M'Pherson, quite delighted, 'that you have brought me the best year's trade I have had yet. Besides, man, I count it no small thing to have beat Captain Sublette—the most cunning trader on the frontier.'

'I am very much gratified,' said Ray, 'that I have been anyway instrumental in serving you.'

'Ah, that is all very well,' interrupted M'Pherson, pushing his spectacles from their proper position to one above his eyes; 'but just tell me frankly, Mr Ray, why you, who are generally so slow and cold, should all of a sudden take so much trouble to do me a service?'

'It was the first time,' replied Ray, 'that I ever had an opportunity of doing what others would not do.'

'Oh,' said the trader, still more enlightened, 'and do you not expect any share in the great advantage of last night's adventure?'

'That I leave to you, sir.'

'Now, Mr Ray,' said the trader with a smile, 'I wish you would be thoroughly frank with me. I can see plainly enough that you have had some reason for your constant lack of energy, and some equally good reason for suddenly, when you could really serve me, risking your life to do so. I say again, speak out. Have you any conduct of mine of which to complain? Is your salary too small? Your chances of promotion—do they seem too remote? You have doubled my fortune; let me do you some service in return.'

Ray determined to be plain. He saw that the worthy merchant was still in part in the dark, and he resolved to enlighten him. 'My ambition, sir, has been to share your good fortune; and did my hopes extend as far as my wishes, I might say I have hoped one day to possess all you now hold.' This was said with a lurking smile that still more puzzled M'Pherson.

'What! would you be a partner, young man? The idea is a bold one; but, after what you have done, I see no insuperable bar to it.'

'Sir,' said Ray hurriedly, 'I am content to be your clerk, if you will, all my life; but you have a daughter, without whom wealth would be contemptible, and poverty insufferable.'

'Wheugh!' cried the astonished merchant; 'sits the wind in that quarter? And pray, sir, does my daughter know of this?'

'She does. You will recollect our long journey, when we were inseparable companions?'

'Oh, I recollect all; and pray, does my daughter encourage you?'

'She will speak for herself, dear father,' exclaimed the young girl, who, entering, had caught the import of their conversation. 'I did encourage him, because I thought he deserved to be your son. Of late, Mr Ray had almost induced me to regret my resolution; but his recent devotion in your service convinced me that he was still the Edward Ray I had travelled with from New Orleans.'

'And so,' said the old man pettishly, 'you have arranged it all, it seems, and I am to have no voice or will?'

'We have arranged nothing, dear father, and leave it all to you.'

It will readily be believed that Edward Ray and Mary M'Pherson had no great difficulty in talking over the kind-hearted trader. In a few weeks after, Ray was not only son-in-law, but partner at Spokan; and I believe that none of the parties has had yet any cause to regret the 'midnight ride' over the bluff-surrounded prairies of the wild Oregon.

OCCASIONAL NOTES.

THE RAGE FOR CROMWELL.

We shall now probably have a rage for Cromwell, to last some time, as a make-up for the injustice with which his memory has been treated during the past two centuries. Mr Carlyle has set the fashion, and already Cromwell ribbons are sported at many inferior lapells. No one can now be suffered to say a word against this celebrated personage, under pain of an imputation of Dryasdustism, flunkeyism, and many other *isms* terrible to weak brains. What perfect folly, nevertheless, is all this! The man who slaughtered thousands of defenceless people, in order to terrify a nation into submission—a very pretty example, truly, of the principle of 'doing evil that good might follow'—who, finding parliaments troublesome, made his council ordinances pass as laws—who, having overthrown a monarchy, professedly for the benefit of the people, was not unwilling to take the crown to himself and his own family—this man to be an object of undivided worship! Surely nothing but the hatred of something else could make men love Cromwell so much—like Hazlitt lauding Napoleon because he was so detested by the legitimatists. What on earth is there to object to in the good old plan of viewing a human being's errors in connexion with his glories—mixing his shades with his lights? Why should we not see and acknowledge that Cromwell was only one of the class of warrior tyrants, although comparatively a well-meaning one. Surely nothing but a ridiculous truckling dread of that to which he stood in opposition, could dictate an exclusivism of panegyric so utterly absurd.

THE FREQUENT BREAKING OF LARGE BELLS.

An ingenious mechanical correspondent suggests that the frequent breaking of large bells, by which so much expense is occasionally incurred by corporations, cathedral chapters, vestries, and other bodies, is very probably owing to the partial manner in which the striking

of them takes place. The hammer for the hours impinges on one place alone, where it generally forms a deep hollow. The tongue hits two places almost as determinedly. The necessary consequences are a wearing and hardening of the metal at certain parts of the bell, thus introducing into its constitution an inequality, which will make it less able to resist powerful vibrations than it would otherwise be. The obvious remedy is to hang the bell in such a manner that it could be shifted round a small space each week or month, and thus exposed in every part alike to the action of the hammer and tongue.

AUTHORCRAFT.

Sir Lytton Bulwer thus speaks of authors by profession, in his generous biography of Laman Blanchard, lately published:—'For the author there is nothing but his pen, till that and life are worn to the stump; and then, with good fortune, perhaps on his deathbed he receives a pension—and equals, it may be, for a few months, the income of a retired butler! And so, on the sudden loss of the situation in which he had frittered away his higher and more delicate genius, in all the drudgery that a party exacts from its defender of the press, Laman Blanchard was thrown again upon the world, to shift as he might, and subsist as he could. His practice in periodical writing was now considerable; his versatility was extreme. He was marked by publishers and editors as a useful contributor, and so his livelihood was secure. From a variety of sources thus he contrived, by constant waste of intellect and strength, to eke out his income, and insinuate rather than force his place amongst his contemporary penmen. And uncomplainingly, and with patient industry, he toiled on, seeming farther and farther off from the happy leisure in which "the something to verify promise was to be completed." No time had he for profound reading, for lengthened works, for the mature development of the conceptions of a charming fancy. He had given hostages to fortune. He had a wife and four children, and no income but that which he made from week to week. The grist must be ground, and the wheel revolve. All the struggle, all the toils, all the weariness of brain, nerve, and head, which a man undergoes in this career, are imperceptible even to his friends—almost to himself; he has no time to be ill, to be fatigued; his spirit has no holiday; it is all school-work. And thus, generally, we find in such men that the break-up of the constitution seems sudden and unlooked-for. The causes of disease and decay have been long laid; but they are smothered beneath the lively appearances of constrained industry and forced excitement.'

We believe this to be, in the main, a true picture of the life of one who makes literature his profession in London, a few brilliant cases excepted. It is nevertheless true that successful authorship is a recognised means of advancing men in the world, and that there really is a considerable number of persons who, by their pens, and what their pens have done for them in political and social life, occupy enviable positions. While such is the case, there always will be many toiling with little success, as there are in other professions. It is also true that the profession of literature shows us many who have come into it on account of narrow circumstances, and who would be poor although they had never become men of letters at all. We thoroughly believe, however, that the great cause of the personal disasters which we hear of in connexion with the names of literary men, is their being contented to live in the manner of the great bulk of the industrious classes—making the daily effort supply the daily bread, and never providing against the contingencies which embarrass, impoverish, and lead to misery. In a struggling world like this, they have no chance, unless they can make themselves in some measure propertied men. Could they but retain one productive copyright, or keep a little reserve-fund at the banker's, their independence would be comparatively secured. They could choose their task and their taskmasters. They might even come to be the employers of publishers—their natural position—instead of the slaves of that trade, which is the prevalent, and, as we hold, the false one. Were this the case, we should hear but little of the woes attendant on authorcraft.

'It is impossible,' cries some one; 'authors begin poor, and never can they emancipate themselves from that state.' We deny the impossibility. Means have been reserved and stored in far less favourable circumstances; and were there a true will, there would soon be a way. We fear that here lies the real evil. Literary men appear to hug their poverty as a kind of honourable badge of the spirituality of their trade. The common tone amongst them is contemptuous towards the prudential virtues which other men see to be the sure basis of so many others. The very supposition that poverty and literature are necessarily connected, must tend to establish the connexion, and make it indissoluble. We can imagine nothing more contemptible than a whining submission to such an adage.

One example, however, of respectable authorship rising above poverty, is worth pages of discourse upon the subject; and we therefore conclude with a notice which lately appeared in the *Sun* newspaper respecting the celebrated Peter Parley:—

'Fancy a pretty and picturesque suburb of a large city, and that in this village there is one of the most charming cottages in the world, shadowed by graceful American elms, and surrounded by ælanthus, chestnut, and dogwood trees. Enter the door, around the trellis-work of whose portico luxuriant creepers twine, and you will find yourselves, after passing through an entrance-hall, in an apartment, every article of furniture in which, whether for use or ornament, displays the perfect taste of its owner. Pictures by the best English, European, and American masters, adorn the walls, and articles of *vertu* are scattered about in various parts of the room. From the windows we have a charming view of the surrounding country. Away to the right rises the capitol-crowned city of Boston. A hot summer day, even so far north as Boston, is no joke; and that it is unusually warm, is proved by a green and golden humming-bird, which (a rare thing in the neighbourhood) is busy in the bell of a trumpet-vine just outside of the window.

"Will you walk into the library, sir?" says a servant; and, following her, we were ushered into a small room, adorned with

"Statues, books, and pictures fair;"

and a gentleman cordially welcomes us. It is Peter Parley himself—the beloved of boys, and the glory of girls. He is tall, and rather slightly made: for a moment he has laid aside a large pair of smoked-glass spectacles, and we observe that he has a pair of very bright, small, intellectual eyes, and soft and kindly in their expression. I had imagined him an elderly, bald-headed, venerable-looking man: he was quite the reverse of the picture of him which I had hung up in my own private and particular image-chamber. Over a beautifully-shaped head grew short, crisp, curly, dark hair, and his features were rather more youthful in cast than might be supposed in those belonging to a man of some half-a-century old—for that I take to be about his age. He was about the best-dressed man I had met in America; and the whole appearance and bearing of Peter Parley was that of the perfect and high-bred gentleman. Of his mental qualifications, which are not, as they ought to be, appreciated in this country, I shall speak presently.

'Peter Parley's real name is Samuel Griswold Goodrich. He is the son of a clergyman of Connecticut—a state which has sent forth more literary men than any other in America. Mr Goodrich was educated in the common school of his native home; and soon after attaining the age of twenty-one, he became engaged in the business of publishing at Hertford, where he resided for

several years. In the year 1824, he was compelled by ill health to travel, and he visited Europe, and travelled over England, France, Germany, and Holland, devoting his attention particularly to the institutions for education; and on his return, having determined to attempt an improvement in books for the young, established himself in Boston, and commenced the trade, or profession, as it is more genteelly called, of authorship. Since that time he has produced some thirty and odd volumes under the signature of "Peter Parley," which have passed through a great number of editions in America and in this country, and many of them have been translated into foreign languages. Mr Goodrich informed me that a friend of his had actually met with one of his books "done" into Persian; and I have seen a Constantinople edition of one of the earliest of the "Parley" series.

'Of some of these works, more than 50,000 copies are circulated annually. In 1824 Mr Goodrich published "The Token," the first annual which ever appeared in America; and for fourteen years he continued to edit it, during which time he contributed most of the poems, of which he is known to be the author. His "Fireside Education" was composed in sixty days, whilst he was discharging his duties as a member of the Massachusetts senate, and superintending his publishing establishment.

'He told me, in the course of a conversation, that he had adopted the name of "Peter Parley," as he wished the tales he told children to be related by a gossiping old gentleman, who could talk and "parley" with them. "When I first used it, I little thought," said he, "that before long it would be better known than my own."

'During the disastrous panic which occurred some years ago in the American money-market, Mr Goodrich, in common with hundreds of others, was a sufferer to a very serious extent. Previously to the calamity he had built himself a beautiful mansion at Roxbury, near Boston, and near it a lodge of very elegant design. Here he had fondly hoped to spend the evening of his days in the enjoyment of competence, and even of affluence. But the crash came; and one dreary day Peter Parley, after all his hard work, found himself stripped of every dollar; and, instead of being independent in circumstances, ten thousand dollars in debt. But he was not the man to despair; and, acting upon the principles of perseverance and industry he had so often inculcated, he "never gave up," but set his shoulders once more to the wheel, and, with a willing heart and cheerful hope, commenced life anew. He was not so young as when he first wrote books; but the mine was yet inexhausted; his arm was still vigorous, and he recommenced working in the veins of knowledge. He was a prudent man, and so he sold his large house, and, with his accomplished wife and young family, removed to the lodge, which his taste soon converted into a charming home; "and," said Mrs Goodrich to me, when I visited them a few months ago, "we are just as happy as we were there." Day and night toiled Peter Parley, flinging off book after book with unexampled rapidity, until fortune smiled on her patient wooer, and partially restored him that of which chance had deprived him. Still he is toiling for the children, and, I am happy to say, not without earning his just wages.

'Mr Goodrich's eyesight obliges him to seek the aid of his wife's pen; and it is not impossible that a certain indescribable charm which pervades Peter's later works may be ascribed to this circumstance.'

Talk with interest of a literary life spent in garrets and prisons! How infinitely more interesting this picture of prudential authorship, practised amidst the unostentatious comforts which make a rational man's sufficiency!

HUME AND SCOTT.

To a common being of this world, one almost inevitable (fortunately not invariable) result of being patrimonially exalted above his fellow-creatures, and the necessity of applying to any useful employment, is the creation of a peculiar selfishness. He comes to think of the world as made for him and his grade alone; the other classes appear as mere servile appendages, whose merits are to be estimated only by the flattery they give and the services they render—too well off if they make a tolerable living, and by no means entitled to complain if they be occasionally cheated out of the fruits of their labours. Against such a spirit it would apparently require all the efforts of a high principle to make head. It is perhaps the most dangerous particular in the position of an exalted class, however otherwise circumstanced, for it galls the very soul of all beneath them.

It is curious to see two men so identified with old cavalier principles as Walter Scott and David Hume allowing their natural feelings on this point to escape them, as we find in their respective biographies. The former does so in speaking of his father as an agent for landed men. 'Most attorneys,' says he, 'have been suspected, more or less justly, of making their own fortune at the expense of their clients: my father's fate was to vindicate his calling from the stain in one instance, for in many cases his clients contrived to ease him of considerable sums. Many worshipful and beknighted names occur to my memory, who did him the honour to run in his debt to the amount of thousands, and to pay him with a lawsuit, or a commission of bankruptcy, as the case happened. But they are gone to a different accounting, and it would be ungenerous to visit their disgrace upon their descendants.'

We have an escapade of Hume's feelings in reference to a gentleman of noble family (the brother of an earl), who chose to make up to him when he thought he could be of service to him, albeit he had previously overlooked the philosopher. The circumstance occurred when Hume was secretary to the embassy, and in the blaze of distinction, at Paris in 1764. We may imagine with what feelings his friend Dr Blair read the following, in reply to a letter in which he had requested Hume to introduce Colonel L—— 'to the good company where you are,' and 'put him on the best methods of enjoying and improving himself at Paris:'—'Before I was favoured with yours, I had seen Colonel L——, who waited on me, as is usual with the British who come to Paris. I returned his visit, and introduced him to the ambassador, who asked him to dinner among seven or eight of his countrymen. You will be surprised, perhaps, when I tell you that this is the utmost of the civilities which it will ever be possible for me to show Mr L——. For as to the ridiculous idea of foreigners, that I might introduce him to the good company at Paris, nothing can be more impracticable. I know not one family to which I could present such a man—silent, grave, awkward, speaking ill the language; not distinguished by any exploit, or science, or art. . . . Your recommendations have great weight with me; but if I am not mistaken, I have often seen Colonel L——'s face in Edinburgh. It is a little late he has bethought himself of being *ambitious*, as you say, of being introduced to my acquaintance. The only favour I can do him is to advise him, as soon as he has seen Paris, to go to a provincial town, where people are less shy of admitting new acquaintance, and are less delicate judges of behaviour.'

No one can reasonably doubt that both Scott and Hume were alive, where necessary, to the selfishness so besetting, as we have said, with those whom, as a class, these men worshipped. Both men, too, manifested in life a hardy spirit of practical independence, which seems totally at variance with their feelings respecting artificial distinctions of ancient date. Does not this tend to make more and more clear the principle we lately endeavoured to illustrate, that men sometimes embrace and profess obnoxious theories, because of the very purity of their own hearts from all that these theories imply? With the great minstrel and the great philosopher alike, the ancient ranks and other institutions were favourites of the imagination, not the reason. They gave them

qualities out of the riches of their fancy, as men do their mistresses, and then fell down and worshipped them. But all this was quite compatible with dispositions on their own part most humble and kindly, in every respect the reverse of those which an undue exaltation tends to create; and such, we know, really were the predominant moral qualities of both men.

SUMMARY OF SAVINGS' BANKS.

A SUMMARY of the collective accounts of the savings' banks distributed over Great Britain and Ireland, has recently been drawn up and published by Mr John Tidd Pratt, the barrister appointed to certify the rules of friendly societies and savings' banks. The account is closed to the 20th of November 1844, and presents data for reflections and deductions of an extremely gratifying and interesting character.

It would be rash to conclude that the amount of deposits in these provident institutions is an indication of universal prosperity; because two sections of the community do not share in their advantages—namely, those who are too poor to have money to save, and those who, being too rich, make use of banks of higher pretensions. There is, however, a third section of the nation—happily far from a small one—consisting of frugal and industrious individuals in the humbler ranks of society, who may be designated the savings'-bank class. They are the working part of the community—its sinews; and, in so eminently-productive and manufacturing a country as ours, unquestionably the most important part of the nation. The inference, therefore, is as inevitable as it is pleasing, that the larger the capital in savings' banks, the more healthy the condition of the nation at large. Keeping these considerations in view, all must be gratified to learn that at the end of the year 1844, the deposits in the 577 savings' banks existing in the three kingdoms amounted to the amazing sum of L.31,275,636, accruing from 1,012,475 separate accounts;* the average amount of each account being L.27, 18s. Since 1844, twelve additional savings' banks have been established—a circumstance which leads to the anticipation that, when the 1845 account comes to be made up, it will be found greatly to exceed its immediate predecessor.

By the rules of regularly-appointed savings' banks, no depositor can invest more than L.30 in any one year, ending on the 20th November; nor more than L.150 altogether. Should the maximum sum be permitted to lie and accumulate at interest, no interest is allowed after it has risen to L.200. The rate of interest payable to the trustees and managers by the government is L.3, 5s. per cent., whilst that payable to depositors must not exceed L.3, 0s. 10d. per cent. per annum. The difference in these rates of interest provides a fund for office expenses.†

When we look into the particulars of the summary, we find a few facts which speak for themselves, and others which admit of interesting comment. To begin with England:—At the end of 1844 it had 445 banks, in which 813,601 single depositors had placed L.23,469,371. More than half of them (namely, 461,195) were creditors for sums not exceeding L.20. Besides individuals, 18,689 friendly and charitable societies had placed in the English savings' banks L.1,643,494; so that the total of accounts was 832,290, and of deposits L.25,112,865.

Taking these facts as a data for England, we find that, contrary to general expectation, the English are more provident than their neighbours; for, as the single depositors amount to 813,601, out of a population of more than fifteen millions, it follows that one individual out of 18½ was in 1844 a savings' bank depositor. The average amount of each deposit was L.28.

In turning to Scotland, it is natural to expect evidences of that frugality for which the people of the north are celebrated brought out by the savings' bank returns. But the very reverse is the fact. In Scotland (population in 1841 about 2,600,000), there were, at the end of the savings' bank year, thirty-six savings' banks, containing L.966,149, arising from 68,791 single depositors, three-fourths—namely, 52,442—of whose accounts were for sums not exceeding L.20; whilst 1033 charitable and friendly societies were creditors to the amount of L.77,034 more, making a total of 69,824, and L.1,043,183 sterling. Thus we find that only one person in about every 38½ was in 1844 a depositor; whilst the average amount of each deposit, as well as the proportionate number of depositors to the gross population, was half that of England; being only L.14. These figures might be apt, without explanation, to overturn the current notions of the frugality and hoarding habits of the Scotch. The fact is, that the excellence and general efficiency of the local banking-system of Scotland offers so many advantages to persons possessing small accumulations, that it draws away the better class of depositors from the savings' banks. A small tradesman will, for example, go on making use of the latter till he has accumulated from L.10 to L.20, and then withdraw it to establish a credit at a bank of issue. Although such banks allow him about one per cent. less interest than the savings' banks, yet his capital in their hands is more current and pliable; he can draw and pay in when it suits him; he can get accommodation in loans and discounts; and, in short, render his little stock of cash of infinitely more use, and therefore of more value to him, than if it were locked up in a savings' bank. For these reasons, the line which separates the savings' bank class from that which deals with issue banks, must be drawn much lower in reference to Scotland than in England, and we must expect it to cut off a vast proportion of the more affluent amongst the savings' bank depositors. And thus it happens that, while in England not much above half the depositors before referred to were in possession of sums not exceeding L.20, the proportion of that rate of depositors to the whole of the savings' banks contributors was in Scotland above three-fourths.

In Wales, there were, at the period so often referred to, 18,007 single depositors, whose accounts united to make up L.518,348; and adding 683 friendly and charitable societies' deposits, which came to L.81,448, there was a total in Wales of 18,690 accounts, and L.599,796. The Welsh, who have no superior facilities of general banking, or perceptible cause to remove them from the rule we have laid down, appear to be either poorer or less provident than the English; for, out of their population of about 911,000, they had only 18,007 depositors; and it follows that, according to this calculation, one person in fifty only contributes to the twenty-three savings' banks distributed over the principality.

Ireland, when brought to this test, bears out its unfortunate character for poverty and improvidence; for in it only one individual in about 90½ had dealings with the savings' banks (of which there were 73) in 1844; there having been 90,144 single depositors to a population of more than eight millions. Their united capital was L.2,685,698; to which, when we add 1099 societies, with a deposited capital of L.63,319, we obtain a total for Ireland of 91,243 accounts, and L.2,749,017 in deposits. The average of each deposit was L.29. The proportion of persons whose savings did not exceed L.20, was below that of the others we have instanced, being less than half, or 41,546.

In regarding the savings' banks of Great Britain and

* The number of depositors greatly exceeds the number of accounts, inasmuch as 10,631 of the latter are those of friendly societies, each made up of at least twenty times the number of members. It may therefore be reasonably computed, that the number of persons in immediate and indirect communication with savings' banks—including the workmen in various manufactories who club together a single account—is not much under one million and a half.

† The last of the acts of parliament by which savings' banks are regulated, was passed in August 1844. It is the 7th and 8th of Victoria, cap. 83.

Ireland through the medium of Mr Pratt's comprehensive summary, one of the most interesting points of view from which to observe them, is in reference to their local situation. The topography of savings' banks forms a study, by which we arrive at a knowledge of the comparative providence of people in various localities. We naturally turn to the English manufacturing districts to seek for the most extensive employment of these institutions. Though not the largest, the most populous county in England is Lancashire; and here we find that, to a population (in 1841) of 1,667,064, there are 67,159 accounts in thirty-five banks (only one less than all Scotland can boast of), yielding L.2,150,766, making an average of L.30 for each account. Yorkshire presents a more flourishing state of things; for although the population is lower in number than that of Lancashire (having, in 1841, been 1,591,584), the savings' banks accounts were larger in 1844. They stand thus:—35 banks, 71,114 accounts, and L.2,256,843 sterling. Warwickshire, which, though it includes Birmingham, is partly an agricultural county, had, with a population of 402,121, seven savings' banks, and 21,684 accounts, from which an accumulation arose of L.502,389. The amount of deposits in the great commercial and manufacturing towns was as follows:—Manchester, the highest in the empire, L.568,313; Liverpool, L.474,452; Newcastle, L.264,077; Leeds, L.262,908; Birmingham, L.250,080; Sheffield, L.182,838. In Staffordshire, the seat of the pottery trade (population 510,206), there were L.520,470 accumulated from 15,953 accounts.

The mining districts make a very respectable show in this summary for 1844. Cornwall, with its 341,269 inhabitants, had ten savings' banks, and 13,167 accounts, amounting to L.525,922. In Cumberland (population 177,912), there were seven establishments, 7638 accounts, and L.219,457. Durham had 7467 accounts, and an accumulation of L.209,988, to a population of 324,277. Northumberland, with a population of 250,268, contained seven banks, holding 13,114 accounts, and L.477,476 in deposits.

Amongst the agricultural and sea-board districts, Devonshire appears to stand foremost for thrift, in reference to dealings with the banks for savings, even when we consider its large population. Plymouth, including Devonport and its dockyard, had, in four banks, 15,962 open accounts, the total of which was L.565,999. In the quiet city of Exeter, the surprising sum of one million three thousand pounds had found its way into one bank!

In Scotland, the greatest amount of wealth, and perhaps of prudence, appears to prevail in the capital. In the three savings' banks (two in Edinburgh, and one in Leith), 23,479 accounts remained open in November 1844, amounting to L.350,197. The other savings' bank in this county is in Dalkeith, which quiet little place contributed 668 accounts, and L.5356 deposits to its bank. In Glasgow, with a vast excess of population over Edinburgh and Leith, there were only 20,118 accounts, and L.322,144.

The highest accounts in Ireland are those made up in the north, over which a large proportion of prudent Scotch blood is diffused. Antrim contains three savings' banks, which do business with 6209 depositors, and hold L.131,993. The population of the county is 276,188. The noisy county of Tipperary, in the south, with double the population, has only 3567 accounts, and L.116,000, in five savings' banks. In the city of Dublin there are two banks, containing L.568,947, belonging to 23,542 depositors.

Few materials for considering savings' banks with reference to the occupations of depositors exist. Those, however, to which we have had access, prove that the most frequent depositors are domestic servants; next come clerks, shopmen, and porters; after them operatives; and last of all, persons employed in agriculture. One class, much in need of saving habits, have recently been afforded the opportunity of putting by the very small spare sums they may have: we mean soldiers. By a warrant issued in October 1843, regimental banks for savings were established. They have succeeded beyond expectation. From the date of their commencement to the 31st March 1844 (scarcely six months), there had been L.15,069, 3s. 2d. placed at interest by 1890 depositors.

Besides the banks to which we have referred, a few are set on foot by individuals—chiefly with the aim of encouraging prudent habits amongst such poor as they happen to possess any influence over. These are private concerns, not in communication with the authorities, and from which, consequently, no official accounts can be obtained. Though existing in England and Scotland, they abound most in Ireland. While giving the originators of these concerns credit for the best intentions, we must lament that they should keep aloof from the great national system; thus depriving depositors of the broad security which that system offers, and also contributing to defeat an important end—the realisation of exact statistics as to general savings. In some instances, there is reason to believe these private savings' banks are illegal, in consequence of not having their rules certified by the author of the summary before us. For various considerations, we earnestly press on the managers of these concerns the necessity and propriety of uniting them with the national system.

THE GONDOLIERS OF VENICE.

The well-known peculiar arrangement of Venice, as a city planted on a cluster of islands, with the intermediate stripes of water, or canals, serving as streets, has given occasion, in all ages of its history, for boats and boatmen as a means of conveyance. There are, it is true, some land passages through Venice, by means of narrow alleys connected with bridges; but these are inconvenient and circuitous compared with the water communication; and, accordingly, boating has ever been in requisition, and the gondolas and gondoliers continue to this day to be amongst the most characteristic things connected with

> 'The pleasant place of all festivity,
> The revel of the earth, the masque of Italy.'

Reduced as Venice now is from her ancient dignity and affluence—a mere appendage to Austria—the remains of former magnificence, and the number of persons of fortune still residing in it, render it an interesting city. About two thousand public gondolas are required to serve the ferries, and convey passengers from one part of the city to another. These ferries, we may remark, are farmed by little associations of gondoliers from the government. It is now proposed to reduce them, by the erection of another bridge across the Grand Canal; and if this measure be carried, a serious blow will be given to the gondolier interest, already much damaged by the erection of a bridge to the mainland, in connexion with the Milan railway. A few years hence, we may see, indeed, but the ghost of that maritime intercourse which was once the most characteristic feature of the 'sea Cybele.'

While this likelihood is pending, we may be the more curious to know how the gondolas of Venice were constructed and conducted, and what sort of persons were their conductors—a race coeval, we believe, with the city. The gondola, then, may be described as a species of canoe, with a long projecting swan-like neck, and in general having a place fitted up in the centre, much like a carriage or fly, for the accommodation of passengers. The general form is so long and narrow, that a stranger, at the first glance, would suppose the shape to be grossly improper; and a northern would be induced to believe that the mode of propelling boats to which he has been accustomed, would be much more efficient than the method of the gondoliers, who manage their long-shafted oars by pushing them out, and not by drawing them in. The fact, however, is, that the Vene-

tian canals, especially at ebb tide, are so narrow, that boats of the ordinary breadth would be unable to pass each other; and the water being often not more than twelve inches deep, the vessels are in consequence made flat-bottomed. With a load of eight or nine hundred pounds, these vessels draw not more than ten inches. But this trifling draught, combined with the requisite narrowness, is only attainable by means of excessive length. With regard to the manner of rowing, the employment of two men for short distances is regarded as a luxury of the rich. One rower is the usual thing; and it is necessary that his eyes should be directed forwards, that he may turn on one side or the other at any instant. Moreover, he has to shout out at every angle, to avoid coming in contact with the iron prows of boats going in a contrary direction, and not yet in sight. It requires a good deal of practice to manage these long gondolas properly with a single oar.

In a particular class of gondolas, not the least graceful, the place for the accommodation of passengers is without a roof, or covered merely by a light awning of striped linen. Such is the fashion of a great number of the public gondolas, as it is found conducive to cheerfulness; and in these instances there are usually gay-coloured cushions and green-painted seats, for the sake of greater liveliness. But the leading kind of gondola, and that to which all the private conveyances belong, present a receptacle like a close carriage, of a sombre appearance; being not only painted black in the sides, but covered with black cloth, and trimmed with cords and tassels of the same colour, the door-handle and window-sliders being of bronze or gilt. This mournful uniformity has its origin from an old edict which still influences the custom. Under the Doge Barbarigo (1486 to 1500), commerce had expanded to such an extent, that the net income of the state was rated at twelve millions of ducats. Notwithstanding that from that period there was a gradual decline of prosperity, luxury continued to spread itself so much, that government deemed it expedient to impose sumptuary laws. The nobles strove to emulate each other in the decoration of their gondolas; and this was a source of so much extravagance, that an edict was issued commanding gondolas thenceforward to be of one uniform black colour. Previously, the variety in the hues, and the richness of the materials, must have had a beautiful effect. The bridges occasioned the shape of the low round roofs; but the small space assigned for seats is not so readily explained; for, strictly speaking, sitting-room is only provided for two persons. A third person must push himself through the little narrow doorway backwards, and must take some pains to avoid treading or falling upon the two others. When he has, by good luck, accomplished his entrance, he finds a miserable little stool close by the door, where he may indulge himself by sitting *almost* upright, provided he take his hat off.

The motion of a standing oarsman is pleasing and graceful. How beautiful must the gondoliers have looked in their old picturesque costume! Now-a-days, they are tastelessly habited as livery-servants, in coat and round laced hat. Even the gondoliers proper (Barcarolen) have nothing peculiar in their attire save a red or black girdle, to distinguish the party to which they belong. They are all either Castellani or Nicolotti, and warm adherents to their colour. Just see what a sensation you will excite by calling out, as you pass another gondola, *Castellano?* He to whom the question is addressed will either reply eagerly, *Si, si, signor; Castellano!*—(Yes, yes, sir; a Castellano!), or morosely grumble to himself as he passes on; whilst such gondoliers as happen to be thereabouts will sing out, *No, signor; è un Nicolotto!*—(No, sir; he is a Nicolotto!), usually adding some irritating nickname. A stranger who feels inclined to amuse himself with this party-spirit, will do well to have a little money in readiness, either to restore peace, or to prove the interest implied in his inquiries. It is strange that the people themselves do not seem to know anything positive of the origin of this division. If you ask any questions on this head, they reply that it has always been so, and that the Nicolotti had earlier possession of one side of the Grand Canal than their opponents. Whether there is any truth in this statement, I do not know; but certainly the Castello stands on the east, and the church of St Nicholas on the west of the city. The abodes of the boatmen are now no longer kept in distinct quarters, according to their party. The profession of a gondolier is hereditary; and there are some families amongst them who may contend, in point of antiquity, with many noble houses. I myself have seen a book in the possession of a gondolier which had belonged to his family for three hundred years. Thus the feud, whatever may have been its origin, is tenaciously preserved like an heir-loom. The regatta, which takes place yearly, has its share in keeping the strife alive; and the quarrel sometimes waxes so warm, that acts of open violence are perpetrated. A few years since, one of the clan Castellani, who bore the well-known name of Morosino, had carried off the prize, in spite of some trickery on the part of the Nicolotti, and was, in consequence, so severely handled, that the authorities determined to suppress the regatta for the future. For a year or two nothing of the kind took place; but latterly, it has been revived. The boats used on this occasion are built expressly for the purpose. They are slender and fragile; even the weight of a single rower would double them up, were the edges not kept apart by means of cross-bars. I was much surprised to see only black girdles taking part in the training for the regatta; and I inquired if it were pride that restrained the Castellani from preparing themselves for the contest like their opponents. The Nicolotti are a good deal employed in smuggling, and thus acquiring great expertness in managing their boats, one would suppose that it was rather the Castellani who stand in need of a training. Indeed the latter have the reputation of being a proud set. They form the aristocratic party; enter, when young, into the service of the more distinguished nobles; pay a greater regard to a respectable appearance, and still more to a good name, than their rivals; and look upon smuggling as something beneath them. After many inquiries, I was unable to learn any further particulars touching the origin of the quarrel upon which I can place reliance; nevertheless I may mention, that one day as I was passing the Tiepolo Palace, on the Grand Canal, my old boatman, who was a Castellano, told me the dissension between his clan and the Nicolotti had its rise in the political contests which, in the time of the Doge Tiepolo, divided the city into two contending parties. Without treating this tradition as an historical fact, it is interesting to see how the popular tales connect the present state of things with past times. On this account I may be permitted, perhaps, to bestow a few words upon the political contests alluded to.

Two of the Tiepolo family were called to the dignity of doge not long after one another. Jacopo Tiepolo reigned from 1229 to 1249, and Lorenzo Tiepolo from 1268 to 1274, succeeding Raniero Zeno, under whom a new and intricate law of election was promulged. This law had its rise from the apprehensions felt by the Great Council, in consequence of new schisms amongst the nobility, who sided either with the Tiepolos or the Dandolos. These families had been in open feud since 1228, when, at the election that followed Pietro Ziani's death, Jacopo Tiepolo and Raniero Dandolo had an equal number of votes. No other way of getting over the difficulty offered itself except the having recourse to lots; and in this appeal to chance, Tiepolo was the winner. At that time the dignity had real power attached to it, and it was commonly made a source of wealth to the holder. Ambitious men aimed at the rank, and covetous men at the means of acquiring a large fortune. At the death of Raniero Zeno in 1268, there was a great scarcity of food in Venice, and the people grew clamorous. This discontented feeling against the old houses was encouraged by the ambitious patricians, especially those of

newly-ennobled family, who desired to turn the popular humour to their own advantage, and pit the people against the ancient aristocracy. To this aristocracy the Dandolos belonged; for they traced their descent from one of the twelve who chose the first doge, Anafesto, in 697. Lorenzo Tiepolo, however, was placed at the head of the other party; and the Dandolos were exasperated at the result of the election to such a degree, that Lorenzo and Giovanni Dandolo lost all command over themselves, and publicly insulted the doge in St Mark's Square. At this unheard-of act of violence the dissensions became more general. For some time all intercourse between the two parts of the city ceased, and it was debated whether or not the bridge of the Rialto should not be removed. At length the doge succeeded in putting an end to the famine by commercial treaties with Greece, Tunis, and England.

We ought to have adverted sooner to the songs of the gondoliers, as these have served, more perhaps than anything else, to give them celebrity. Who has not felt delight in the homage, presumably paid to genius, in the singing of Tasso's poetry by the Venetian gondoliers? There is, we believe, no doubt that these men had learned by heart, and handed down amongst themselves, favourite passages of both Tasso's and Ariosto's poetry, which they sang in alternate stanzas, in the manner of the Greek chorus, though much corrupted in the course of transmission. The custom, of late years, has died almost out.

> 'In Venice, Tasso's echoes are no more,
> And silent rows the songless gondolier,'

says Byron; who nevertheless tells us, as it were privately, in a note, that he met a man who could sing three hundred stanzas. The present writer can say, for his own part, that he has frequently, at a more recent period, heard the gondoliers singing verses which were partly improvised, partly repeated from memory; and amongst the latter he recognised stanzas of Tasso. Mr D'Israeli, whose acquaintance with Venice was in an earlier age, describes the singing of the gondoliers as harsh and screaming when heard near, but beautiful at a little distance. Offended by the noise, while shut up in the gondola, he was induced to go ashore, leaving one of the singers in the boat, and sending the other to the distance of some hundred paces. To pursue his own narrative: 'They now began to sing against one another, and I kept walking up and down between them both, so as always to leave him who was to begin his part. I frequently stood still, and hearkened to the one or the other.

'Here,' he says, 'the scene was properly introduced. The strong declamatory, and, as it were, shrieking sound, met the ear from afar, and called forth the attention; the quickly-succeeding transitions, which necessarily required to be sung in a lower tone, seemed like plaintive strains succeeding the vociferations of emotion or of pain. The other, who listened attentively, immediately began where the former left off, answering him in milder or more vehement notes, according as the purport of the strophe required. The sleepy canals, the lofty buildings, the splendour of the moon, the deep shadows of the few gondolas that moved, like spirits, hither and thither, increased the striking peculiarity of the scene; and, amidst all these circumstances, it was easy to confess the character of this wonderful harmony.

'It suits perfectly well with an idle solitary mariner, lying at length in his vessel, at rest on one of these canals, waiting for his company, or for a fare; the tiresomeness of which situation is somewhat alleviated by the songs and poetical stories he has in memory. He often raises his voice as loud as he can, which extends itself to a vast distance over the tranquil mirror; and, as all is still around, he is, as it were, in a solitude in the midst of a large and populous town. Here is no rattling of carriages, no noise of foot-passengers; a silent gondola glides now and then by him, of which the splashings of the oars are scarcely to be heard.

'At a distance he hears another, perhaps utterly unknown to him. Melody and verse immediately attach the two strangers; he becomes the responsive echo to the former, and exerts himself to be heard, as he heard the other. By a tacit convention, they alternate verse for verse. Though the song should last the whole night through, they entertain themselves without fatigue: the hearers, who are passing between the two, take part in the amusement.'*

Such are—perhaps we should rather say were—the gondoliers of Venice.

HOW A TAILOR COLLECTED A DEBT.

Near the close of the last century, a tailor, who exercised his avocation in Philadelphia, was imposed upon by a person who contrived to get a suit of clothes on credit, and afterwards eloped without paying for them. The account was placed on the poor man's books, and soon forgotten. Some years afterwards he was examining his old records of debt and credit, profit and loss, when his attention was attracted to this account, and all the circumstances attending it came fresh to his mind. Suddenly an odd thought suggested itself.

'I'll try an experiment,' said he to himself; 'perhaps I may succeed in catching the rogue, and getting my money.'

He immediately prepared an advertisement, in substance as follows, which he inserted in the Philadelphia Gazette:—'If J—— C——, who was in Philadelphia about the month of ——, in the year 1795, will send his address to the editor of this paper, he will hear of something to advantage. Printers in the neighbouring states are requested to copy.' The latter clause was inserted from a vague suspicion that the rogue had taken up his abode in New York.

Having instructed the editor not to disclose his name to the debtor, if he should call, but to request him to leave his address, the tailor patiently awaited the result of his experiment. In a short time he was informed, by a note from the printer, that the individual alluded to in the advertisement, having arrived from New York, might be found at a given place in the city.

The tailor lost no time in preparing a transcript of his account, not forgetting to charge interest from the time that the debt was incurred. Taking a constable with him, who bore a legal process suited to the occasion, he soon arrived at the lodgings of the debtor. The constable was instructed to stand off at a little distance till a signal should indicate the time for him to approach.

The tailor now rang the bell; and when the servant appeared, requested him to inform the gentleman of whom he was in search that a friend wished to speak with him at the door.

The man obeyed the summons, and soon both debtor and creditor were looking each other in the face.

'How do you do?' kindly inquired the tailor. 'Perhaps you do not know me?'

'I believe I have not had the pleasure of your acquaintance,' politely answered our hero.

'Do you remember purchasing a suit of clothes several years ago of a poor tailor, and forgetting to pay for them?'

'Oh no,' said the gentleman, blushing slightly; 'you must be mistaken in the person. It cannot be me that you wished to find.'

'There is no mistake; you are the very man I wished to see. You have on at this moment the very waistcoat that I made for you; and you will acknowledge it was of good stuff, otherwise it could not have lasted so long?'

'Oh yes,' said the gentleman, appearing suddenly to recollect himself; 'I *do* remember now the circumstances to which you allude. Yes, yes; I had intended to call and settle that little bill before leaving Philadelphia, and you may depend on my doing so. I have come here to take possession of a large amount of property which has fallen to me by will. See! here is the advertisement which apprised me of my good fortune.'

Here he handed the tailor a New York paper, containing a copy of the advertisement whose history we have given above. The tailor looked at it with imperturbable gravity, and said—'Yes, I see you are in good luck; but as my demand is a small one, I think I must insist on payment before you come into possession of your property.'

The proper signal here brought the constable into the presence of the parties. The swindler was particularly astonished at the appearance of this functionary, who immediately began to execute his part of the drama.

'What!' exclaimed the rogue in an angry tone, 'you surely haven't sued me?'

'Yes I have,' replied the tailor; 'and you should be thankful that nothing worse has happened to you.'

'Come in then,' said the debtor, finding himself fairly caught; 'come in, and I will pay you, if I must.'

The three went into the house together, and the slippery gentleman having ascertained the amount of the bill, paid it in full.

The tailor having signed the receipt, placed it in the hands of the

* Quoted in Notes to Childe Harold from Curiosities of Literature (edit. 1807), ii. 156.

late creditor with feelings such as may be readily imagined. The swindler took it, and for the first time glanced at the various items of which it was composed. He said nothing till he came to the last charge, which was '*for advertising*,' when he broke forth—'Halloo! what's this? "*For advertising?*" That's an odd charge in a tailor's bill. You're cheating me!'

'Oh no,' coolly replied the tailor; 'that is all right. I have charged you the cost of publishing the advertisement which you have just now showed me.'

Here the swindler demanded, 'Do you mean to say that *you* caused the publication of that advertisement?'

'Truly I did,' replied the tailor with most provoking coolness.

'Then you told me a falsehood in it,' quickly retorted the rogue.

'Convince me of that,' said the tailor, 'and you will find me ready to confess the fault.'

'You said I should hear something to my advantage if I would come here.'

'You are mistaken,' immediately responded the tailor; 'I only promised that you should hear of "something to advantage;" and is it not to the advantage of a poor tailor to collect an old debt?'

'If I can catch you in the street,' said the swindler in the deepest rage, 'I'll give you such a cow-hiding as will not leave the breath in your body.'

'Nonsense now,' said the tailor; 'if you really intend to do anything of that sort, we had better step out into the back yard, and finish the business at once.'

The rogue was completely nonplussed by the coolness of the tailor, and stood speechless, and almost petrified.

'Now,' said the tailor good-naturedly, 'let me give you a piece of advice. When next you have occasion to get a suit of clothes, you had better not attempt to cheat the poor tailor, but pay him honestly; for then will your conscience not disturb you, and your sleep will be sweet and refreshing. Farewell!'*

JOHN BULL'S HOUSEKEEPING ACCOUNT—1844 AND 1845.

THE question of comparative prosperity is one of which people have a much more distinct idea in its private than in its public application. Any one with that very usual degree of resources expressed by the term 'a limited income,' understands clearly enough what is meant by being a little better off one year than another. We appeal to a small tradesman, or a small clergyman, or any other small person, with not a small family. Suppose he has got on in the world, and is not quite so pinched as he was; the difference is this—he has two or three joints a week instead of only one. He sometimes sees a sirloin on his table. Once a month or so fish is substituted or prefixed. Instead of the everlasting 'light' dumplings, and suet dumplings, and batter puddings, with which he was compelled to satisfy or deaden the hunger of his children, he can afford an occasional plumpudding; and is not deterred from rice or fruit tarts by the expensive appendage of sugar. The batter betrays a little more of the egg; and winter is beguiled with jam and preserves. Cheese comes in after dinner, notwithstanding the old housewife's saying, evidently a tradition of the revolutionary war, that 'cheese stands in no stead.' After that also now and then there is a dessert. Oranges, almonds and raisins, figs and prunes, are either spread out in state, or made the subject of an agreeable surprise at some less solemn hour of the day. The young gentlemen and ladies are earlier delivered from the bondage of milk and water, and made free of tea and coffee. It is no longer a rule that the third cup shall be without sugar; and the presiding matron has not quite so anxious an eye on the butter pot. There are two candles instead of one on the table; and if any of the family should be discovered reading, or talking, or playing by candle-light in another room, it is not thought as bad as schism or rebellion. Then the children do not go so long out at the elbows, or knees, or toes, or heels, or other salient points of their structure. New kid gloves, and new silk pocket handkerchiefs, oftener remind the elders of their first infantine delight at 'new clothes.' When the family becomes a little too large for the house, and the crowded population of the nursery begins to emigrate into separate bedrooms, the father either himself builds another 'room below and room above,' or gets his landlord to build them with a rise of rent. As the furniture has then to be re-arranged, the mistress of the house takes the opportunity of dignifying herself with a new mahogany wardrobe, and perhaps a new drawing-room table.

There is something very intelligible, and not at all low-minded, or utilitarian, or irreligious, or otherwise offensive, to those at least who are themselves the subject of this happy change. It is what the master of the house has toiled for, and denied himself many a pleasure to obtain. He has slaved at his counter or his desk, or, worse than either, in his school-room; he has taken no holidays, no summer excursions; he has drunk no wine, mounted no horse, kept no dog, gone to no parties, had no friends—of a convivial sort at least; indulged in no tastes, had no hobbies, built no castles; has, in a word, been that slave of slaves, that king of drudges—a family man; merely that he might have the means of increasing all these poor creature-comforts to his wife and children, together with the further comfort of a better education, concerning which we will not now speak more particularly. And who will gainsay, who will censure, or who will deride this sort of prosperity? The man who wilfully flies from banquets that he may play the Spartan, or the hermit, on black bread, acquires a right, which we will not dispute or envy him, to laugh at this smug felicity. But the ninety-nine men out of a hundred who get or enjoy whatever they can, have no right to do anything but be thankful that others share with themselves the favours of a beneficent Providence, and the fruits of honest exertion.

But take only a still more numerous family, the elders still more hard-worked, their income still more limited, their hardships, and labours, and denials still more considerable, their children still more numerous, craving, and wasteful—take the great family of the nation—and though the case is really just the same, an absurd affectation prevents many people from recognising the elements of its prosperity. Better trade, busier ports, more ships, give them no idea than so much selfish mercantile hubbub. They think only of a few speculators, or a few manufacturers making their fortunes. But it is evident that, if there is a larger introduction of the gifts of Providence, there is more for every one to enjoy; and though some poor creatures are so utterly destitute and deserted that nothing will alleviate their condition, a very great proportion of the people must experience that increase of comforts of which we have given above a particular illustration.—*Times*.

* We find the above piece of drollery in a periodical entitled 'The Spectator,' published at Rochdale—one of those small country papers which it is pleasing to see starting up in different parts of England and Scotland. We have taken the liberty of altering some of the expressions.

THE TROUBADOUR AND HIS SWALLOW.

[FROM THE FRENCH.]

THE warm breath of summer
Has burst the frost's chain;
The earth is all blossom;
But the bird of my bosom,
My beautiful swallow, returns not again.

I hear its gay fellows—
More faithful, alas!—
The bright dawn saluting;
With rapid wing shooting,
I see them across the blue lake's surface pass.

Long known—long beloved!
When wilt thou return
To cheer me, heart-weary?
In absence so dreary
From thee, O my swallow! I linger and mourn.

None other can give thee
A life half so fair;
Like thine was my nature,
Thou bright joyous creature;
The same food and shelter with me thou didst share.

For thee does my window
Half open remain:
What hinders thee, dearest?
Can it be that thou fearest
In me a harsh tyrant with prison and chain?

The flower in the wild-wood
Gives place to the fruit:
The summer on stealeth;
And each day revealeth
My hope of thy coming grown fainter and mute.

My strain, once so gleesome,
Is now a sad song:
Art thou faithful no longer?
Has death proved the stronger?
No matter; thy minstrel will pine for thee long.

D. M. M.

HUMAN BROTHERHOOD.

The race of mankind would perish did they cease to aid each other. From the time that the mother binds the child's head, till the moment that some kind assistant wipes the death-damp from the brow of the dying, we cannot exist without mutual help. All, therefore, that need aid, have a right to ask it from their fellow-mortals; no one who holds the power of granting can refuse it without guilt.—*Sir W. Scott.*

No. 120. New Series. SATURDAY, APRIL 18, 1846. Price 1½d.

MY BROTHER THE LAIRD.

I was very young when I left the Highlands, and I was many years absent from the wildly-beautiful glen in which had been passed my happy infancy. When, almost as a stranger, I returned to it, my brother was the laird—not my noble-spirited elder brother, the first in the chase, the foremost in every 'ploy' of daring, the friend of the shock-headed fox-hunter. He had fallen in the battle-field, far from all those who so proudly gloried in him. Nor was it my second, handsome, light-hearted brother, the gay promoter of all the mirth we had enjoyed. He must 'serve' too. There was no other profession but that of arms then thought of in the Highlands, and the transport he was embarked in was lost on its way with troops to America. My third brother, a small, delicate child, quiet in all his plays, solitary in all his habits, thoughtful, serious, the embryo student rather than the worthy descendant of Highland chieftain or of Border moss-trooper—he it was who was destined to wear and to transmit the honours of his line. He had been latterly educated in England with our younger brother and myself, who, at the death of our parents, had been left to the care of our Indian uncle.

The colonel had brought back with him from the East an English wife, a handsome fortune, and the same warm Highland heart he had taken out with him, which prompted him to visit my father with the least possible delay after his return. He had no children of his own, which perhaps made him take so fondly to us; and when, as orphans, we became entirely dependent on him, his affectionate solicitude for our welfare appeared to redouble. His wife did her part to repair the loss of our parents, as far as was then understood to be the requisite attention to the young. She was always kind in manner to us; provided us amply with the necessaries befitting our station; and encouraged my uncle in various little plans for our amusement. They lived in London, in a good house in Lower Brook Street, and we were placed at school. My brothers were sent to a clergyman near Henley, who took a limited number of pupils. I went to Queen Square, in common with most young ladies of our station. My holidays, in winter, were spent in my aunt's drawing-room; in summer at some watering-place. My more fortunate brothers passed their summer holidays in the Highlands, under the care of our uncle the captain. I therefore saw little of them; and we were soon entirely separated; for they went to college in Glasgow, from whence my younger brother proceeded to India—my uncle, the colonel, having influence enough to procure a writership for him. The laird went to travel with a college friend, an Irishman, who took him over to his own green isle. There he married. He had been settled for some time on his Highland property, with his handsome Irish wife, more years than there is need to mention, before circumstances enabled me to fulfil the treasured wish of my heart—a visit to him.

My husband and I travelled from Edinburgh in a way I cannot now look back on without smiling. The same horses took us on from Perth by very easy stages, getting through but two in a day, at five miles an hour, or thereabouts. When I quitted the Highlands, I had ridden from home down the bridle-road for near twenty miles to a small inn or rather clachan; for there were several black huts collected near a small stream, a short distance from the military road. The principal hovel was then of turf, like the rest, but much larger, with an open chimney-top over one gable, and a stone-and-lime chimney-stalk at the other. Of the many smaller black huts round, some were barns, and some were stables, and some were sheds for cows and poultry; a few were merely peat-stacks; while a few more were the habitations of human beings, as was known by the hole in the roof, through which the smoke issued. All had troops of half-naked children playing in the mud, and dirt, and duck-pools before their untidy doors, looking, with their sun-burnt skins and sun-bleached hair, like nothing human. Now, amidst such of the old black huts as still remained, there were several stone-built cottages, windowed and chimneyed, deserving of better care than they had met with; for the old dirt about the doors remained, with the addition of dung-heaps under the windows. I looked in vain towards the burn for the humble black 'public.' In its place stood a three-storey-high stone building, full of good-sized windows, with a good square of offices behind, and upon the flight of steps leading up to the door was a smart little Englishwoman, the wife of the Highland landlord. The old bridle-road was gone. No horses waited at the clachan for the guests of the laird of the glen. Our carriage rolled on over a fine well-engineered road, which at this spot turned off into the mountains. It followed the course of the stream for some miles through the dreary moor, enlivened only by a few wandering sheep, and a few scattered turf hovels, each with its patch of corn; then winding up a hill, we left all that was bare behind us, and at our feet lay the wide lake, with its fertile shores and its distant walls of mountains, its further extremity lost beneath the high-peaked hill on which the beacon-fires of our clan had in former days been lighted.

On descending this rising ground, the road divided—a branch diverged to each side of the lake. A dozen miles of beautiful scenery, and of somewhat perilous travel in those rocky parts, where we journeyed along galleries cut from the bank high above the water, brought us 'home.' We were expected, and I had hoped to have met at the march some of our many humble friends to give me welcome; but we crossed the burn

which divided my brother's property from the little kingdom of the neighbouring noble, without one voice to greet us. We passed on among the birch thickets; and I was bending forward to catch the first look of the old tower of my fathers, when a shout, perfectly astounding, rent the air. The carriage had emerged from the wood upon a plain of meadow land stretching across all the lower part of the glen, where the stream which almost dashed through the upper end of the valley, after falling from the rocky ledge, wandered quietly forward to the lake. A little back stood the old castle on its terrace, and between it and the river had been, in my faher's day, a marsh, constantly overflowed in the Lammas floods and winter speats, where my brothers had spent many a long day duck-shooting. It was now dry, firm, and level, and, at the moment we entered on it, covered with troops, by whom, it was clear, I was to be received with military honours. I had never thought of the volunteers; but there they were—several companies of well-appointed men, in the belted plaid, with plumed bonnets and glittering arms; and when manœuvring in measured step with the firm and springy tread of their race, the chequered hose and tasselled garter on every handsome leg, a degree of effect was given to their marchings and counter-marchings not to be approached by a regiment less picturesquely accoutred. Several mounted officers were galloping over the field, and every here and there flag-staffs were erected on it. Near one of these more marked stations was a group of ladies and gentlemen on horseback—one of the ladies in regimentals, as nearly as they could be affected. She wore a scarlet jacket with gold facings, a tartan petticoat, and the blue bonnet with feathers. Her gay and graceful air, with a certain habitual assumption of authority in her manner, showed her at a glance to be 'the lady.' The officer in command had given some orders to his troops; for, on ceasing their shout of welcome, part left the lines, and bounding on without order towards the hill we were descending, the military mob in a few moments surrounded and seized the carriage, unharnessed the horses, and, with another wild hurrah, they bore us along the plain and through the river to the foot of the terrace, my London man-of-business husband fully as much amazed as pleased with the theatrical grandeur of our reception. At the castle, all the rest of the people were collected. Women, girls, old men, and children—all eagerly watching our triumphal progress, and rushing forward with the warm shake of the hand, the blessing, and the smile of real love, that so truly welcomed home the child nurtured amongst them.

I was several days in recovering from the agitation of my arrival. When my feelings had leisure to comprehend what was passing around me, how everyway changed appeared the habits of the once quiet abode of my father's retired family!
